

INTERNATIONAL HANDBOOK OF THE RELIGIOUS, MORAL
AND SPIRITUAL DIMENSIONS IN EDUCATION

International Handbooks of Religion and Education

VOLUME 1

Aims & Scope

The *International Handbooks of Religion and Education* series aims to provide easily accessible, practical, yet scholarly, sources of information about a broad range of topics and issues in religion and education. Each *Handbook* presents the research and professional practice of scholars who are daily engaged in the consideration of these religious dimensions in education. The accessible style and the consistent illumination of theory by practice make the series very valuable to a broad spectrum of users. Its scale and scope bring a substantive contribution to our understanding of the discipline and, in so doing, provide an agenda for the future.

International Handbook of the Religious, Moral and Spiritual Dimensions in Education

TABLE OF CONTENTS

PART ONE

Preface	xv
About the Editors	xix
About the Contributors	xxi
SECTION ONE	
Introduction to Section One: Philosophical/Theoretical Discourses on the Religious, Moral and Spiritual Dimensions of Education <i>Gloria Durka</i>	3
Ancient Philosophy and Religious Education: Education as Initiation into a Way of Life <i>John L. Elias</i>	9
Christian Education and the Reconstruction of Christian Faith <i>John M. Hull</i>	23
Religious Education and the Nation-State <i>Gabriel Moran</i>	41
Religions in the Post Modernist Era <i>Joanmarie Smith</i>	51
The Relevance of a Wisdom Tradition <i>Gary Finlay</i>	65
The Moral Demands of Contemporary Life and Christian Moral Education <i>Harold D. Horell</i>	77

The Integral Philosophy of Ken Wilber and Religious Education <i>Anta Filipstone</i>	93
Dialogue to Truth in Bell Hooks and Jane Roland Martin <i>Namulundah Florence</i>	107
Ecofeminism—A Healing Perspective for Reshaping Religious Education <i>Dzintra Ilisko</i>	127
What is Rising? The Teaching of Maria Harris <i>Aileen Carlin Giannelli</i>	141
It Takes More than Angels: The Legacy of Sophia Lyon Fahs to Religious Education <i>Lucinda A. Nolan</i>	153
The Educational Significances of Spirituality in the Formation of Faith <i>Joyce Bellous</i>	171
From St Ignatius to Obi-Wan Kenobi: An Evaluative Perspective on Spirituality for School Education <i>Graham Rossiter</i>	183
Spirituality as a Bridge to Religion and Faith <i>David Tacey</i>	201
Defining Spirituality in Education: A Post-Soviet perspective <i>Inga Belousa</i>	215
Sankofa: An Inherently Religious Dimension of African Education <i>Roseanne McDougall</i>	231
Religious Education and Peace Education: A Partnership Imperative for Our Day <i>Linda L. Baratte</i>	243
Educating the Multicultural Adult Latino Community: An Augmentative Pedagogy for Religious Educators <i>Jorge Diez</i>	259
An Overview of Orthodox Christian Religious Education <i>Anton C. Vrame</i>	277

SECTION TWO

Introduction to Section Two: Religious Education and Debates about Plurality and Culture <i>Robert Jackson</i>	295
Plurality and Pluralism in Religious Education <i>Geir Skeie</i>	307
Plural Selves and Living Traditions: A Hermeneutical View on Identity and Diversity, Tradition and Historicity <i>Wilna A. J. Meijer</i>	321
Critical Realism as a Tool for the Interpretation of Cultural Diversity in Liberal Religious Education <i>Andrew Wright</i>	333
The Future of Religious Education in the Context of Postmodernity <i>Philip Hughes</i>	349
Religious Education and Citizenship in Postmodern Societies <i>Fernand Ouellet</i>	363
Human Rights and Religious Education: Some Postcolonial Perspectives <i>Liam Gearon</i>	375
Ethnography, Religion and Intercultural Education <i>Eleanor Nesbitt</i>	387
Understanding Religious Diversity in a Plural World: The Interpretive Approach <i>Robert Jackson</i>	399
Dynamics of Religious Culture: Ethogenic Method <i>Mary Elizabeth Moore</i>	415
Religion Education in South Africa <i>David Chidester</i>	433
Religious Education Culture in Modern Turkey <i>Recep Kaymakcan</i>	449
Defining and Promoting the Study of Religion in British and American Schools <i>Bruce Grelle</i>	461

Teaching About Religion at School in France <i>Mireille Estivalèzes</i>	475
The Contribution of Hinduism and Hindu-Inspired Spirituality to Australian Religious and Values Education <i>Terence Lovat</i>	487
Islamic Nurture and Identity Management: The Lifeworld of Muslim Children and Young People in Norway <i>Sissel Ostberg</i>	501
Handing on Religious Values to Young Orthodox People in a Western, Secularised Society <i>Richard Rymarz</i>	513
The Treaty of Waitangi: Implications for Christian Theological Education in Aotearoa New Zealand <i>T. John Wright</i>	525
SECTION THREE	
Introduction to Section Three: Conversations About Religious Education <i>Kathleen Engebretson</i>	549
Philosophical Approaches to the Teaching of Religion in Schools <i>William K. Kay</i>	559
Religious Education in Europe: Comparative Approach, Institutions, Theories, Research <i>Karl Ernst Nipkow</i>	577
Religion, Violence and Religious Education <i>John M. Hull</i>	591
Catholic Church Documents on Religious Education <i>G. P. (Joe) Fleming</i>	607
Functional Democracy and the Development of Doctrine: A Participative Approach to Religious Education <i>Graham English</i>	621
The Essence of Education is Religious <i>Anne Hunt</i>	635

Phenomenology and Religious Education Theory <i>Kathleen Engebretson</i>	651
Learning about and Learning from Religion. The Pedagogical Theory of Michael Grimmitt <i>Kathleen Engebretson</i>	667
The Spiritual and Moral Dimension to the School Curriculum: A Perspective on Across-the-Curriculum Studies <i>Graham Rossiter</i>	679
Religious Education and Spiritual Development: Pedagogical Insufficiency and Possibility <i>Clive Erricker</i>	697
To Know Before Whom You Stand: A Philosophy for A Spiritual and Moral Liberal Jewish Education for the 21st Century <i>Sherry H. Blumberg</i>	717
Changing Learning Paradigms in the Religious Education Classroom <i>Patricia Malone</i>	731
Textbooks in Religious Education <i>Michael T. Buchanan</i>	749
A Shared Praxis Approach to Religious Education <i>Thomas H. Groome</i>	763
Leadership in Religious Education: A Critique from the Australian Perspective <i>Leonie Crotty</i>	779
An Educator's Faith <i>Mark Chater</i>	799
Dimensions of Adult Religious Education <i>Anthony J. Kelly</i>	815
Chaplaincy in University: A Need Not an Option <i>Jennie Clifford</i>	831

PART TWO

Preface	xv
About the Editors	xix
About the Contributors	xxi
SECTION FOUR	
Introduction to Section Four: Educational Policy and the Religious, Spiritual and Moral Dimensions of Education <i>Andrew McGrady</i>	851
The Religious, Moral and Spiritual Dimensions of Education: National, Regional And International Constitutional and Legal Frameworks <i>Peter Schreiner</i>	857
Journeying Towards the ‘Other’: A Challenge for Religious, Spiritual and Moral Education <i>Eoin G. Cassidy</i>	869
The Aesthetic Revelation of the World as Education’s Main Concern <i>Wilna A.J. Meijer</i>	885

Creative and Spiritual Education in the Human Development Process <i>Maria da Conceição Azevedo and Helena Gil da Costa</i>	1321
Soulful Learning: A Vital Component of Curriculum Development <i>Mary Nuttall</i>	1343
Teaching Scripture in Religious Education <i>Sally A. Liddy</i>	1361
The Theatre of Learning: Developing Spirituality Through Experiential and Active Techniques which also Promote Academic Achievement in Religious Education <i>Sue Phillips</i>	1377
Index	1391

PREFACE

In today's complex and shrinking world, there has been, particularly in western cultures, an identifiable change in the individual's relationship with religious traditions, and some of these changes have also permeated non-western cultural traditions, as they have been exposed to, and influenced by, western life styles and contexts through developments in communication and technology. This has tended to result in secular and materialistic cultures, where attention in education is focused on the outer life of the individual, and the attainment of knowledge and skills that lead to social status and success. Another outcome has been the increased diversity in culture and religion in societies that were once mono-cultural and mono-religious. While this religious and cultural multiplicity has certainly had a positive impact in the blending of cultural expressions and the growth of inclusive communities, there has also been evidence of the spread of religious chauvinism and intolerance.

Out of this context has emerged a strong and vital interest in human religiosity, spirituality and values, and many are searching for meaning both within and without religious traditions today to seek answers to ethical and moral questions that have been generated by the knowledge and technological explosion. This movement has renewed interest in the lifelong learning aspects of the religious, moral and spiritual dimensions of education. As well, it has generated spirited debate about the nature, purpose and practice of religious education; the place and nature of religious education in secular societies; the relationship between religion and spirituality; the extent to which discussions about religious education can ever be free of ideology; the role of citizenship, ethics and values education, and the application of all of these to global issues.

These are the areas that provide the focus and content of *The International Handbook of the Religious, Moral and Spiritual Dimensions in Education*. They present the research and professional practice of scholars who are engaged daily in the consideration of these aspects of learning and teaching. The result is a collection of essays which are wide ranging, analytical, and scholarly and which reflect contemporary thinking about these dimensions in education, in all of its internationality, as it is today. As well, it proposes new understandings and reflections that point to future directions, which will acknowledge and address these dimensions in education by implementing innovative, exciting and challenging strategies. These essays will be of interest to academics, teachers, students and others who are

interested in the religious, moral and spiritual dimensions of education throughout the life cycle. In addition, they will inform current research and practice, and will propose guiding principles for future curriculum development in the discipline.

The essays in the first section of the collection deal with the philosophical and theoretical foundations of the religious, moral and spiritual dimensions of education. Ultimately they are concerned with what it means to educate, and the requirement that educators face this question constantly in their work. As Gloria Durka claims in her introductory chapter to this section, theory always underlies educational practice, whether this is conscious or not on the part of the educator. Good education is underpinned by good theory, moreover, theory that is known, critiqued, consciously applied and constantly evaluated. "Teachers who do not understand the models on which their methods are based, are confined to doing what their unexamined habits direct them to do. Thus, they are not the authors of their actions" claims Durka. Section one of this collection proceeds to present a variety of theoretical and philosophical perspectives that may influence teachers' choice of practice. Included in this section are theoretical and philosophical perspectives regarding religious education, perspectives from a feminist point of view, contributions on the significance of spirituality for education and discussions about critical issues that have bearing on the religious, moral and spiritual dimensions of education.

The second section of the handbook, edited by Robert Jackson, is concerned broadly with issues of religious education and culture. As Jackson says, "the contributions reflect recent debates about the relationship between religion and culture against the background of the wider debate about modernity and postmodernity" and they come mainly from different parts of the western world (including Europe, North America and Australasian), with Turkey and South Africa providing links to the continents of Asia and Africa respectively. In his introductory chapter for the section, Jackson points out the various ways in which the term religious education is used, and reminds the reader to be aware of these differences in reading the essays in the section. With these differences in mind, the reader is taken through a series of essays which traverse postmodernity, religious and cultural pluralism; the relationship between religion and culture; the varying relationships between religious education and values education; methodology in the fields of the study of religious culture and religious education; case studies of religion in public education and religious education for ethnic and religious minorities.

Section Three of the collection, edited by Kath Engebretson, examines "theory about practice" presenting discussion of practical issues, such as choosing and presenting content, developing curricula, engaging students in inquiry through a lens of various theories about how this should be done. As Engebretson points out, this section attends to the questions: "What is this discipline about? What is its nature and purpose?" Engebretson argues in her introductory chapter that confusion about theory within the religious, moral and spiritual dimensions of education or perhaps, more exactly, confusion about the particular branch of theory to which one adheres, leads to confusion of intention in teaching, to confusion in teaching practice and finally to confused teachers and students. In this section

of the collection, the various branches of theory are presented as a series of sometimes overlapping conversations, which propose certain viewpoints about how the religious, spiritual and moral dimensions of education should be practised. These are categorized as: philosophical, theological and ecclesial conversations; phenomenological conversations; conversations concerning the interface between religious, moral and spiritual education; conversations about the educational nature of religious education and conversations about religious education beyond the school. The categories provide a convenient classification within which to map the field of theory in religious education.

Andrew Mcgrady, the editor of the fourth section, argues that “there is considerable diversity concerning the provision of religious, moral and spiritual education both between countries across the world and within countries themselves”. These essays are concerned with policy regarding the provision of religious, moral and spiritual education in schools and they illustrate the diversity, ranging across the legal, philosophical and theological foundations of policy; the issues that are raised by the use of public space for religious, spiritual and moral education; multi-faith syllabuses for religious education; proposals to introduce ‘objective’ study of religion in countries which prohibit religious education in state schools, and research into the attitudes of religious educators towards issues of gender and equality. This section of the collection illustrates in many ways, and through many cases, the complex relationships that exist between religious, moral and spiritual education and public policy makers; and it provides an informative portrait of this relationship across the world.

The fifth and last section, edited by Marian de Souza reflects the pedagogical aspects of the religious, moral and spiritual dimensions in education. Based on scholarship and research, the essays in this section discuss theoretical underpinnings of learning programs that seek to address these dimensions. They highlight the complementarity of the rational, emotional and spiritual elements in the learning process and “offer a variety of learning contexts and practices that have been carefully researched and developed and, in many cases, trialled to successful outcomes”. The content of this final section should provide inspirational and exciting ideas, strategies and resources for scholars and practitioners alike.

Overall, the editors and contributors present this collection of essays as a testament to the educators and scholars who have assisted in bringing the discipline of the religious, moral and spiritual dimensions of education to its present richness. Inherent in the collection are directions for the future, where the religious, moral and spiritual dimensions of education may offer strategies for education for hope, peace and justice in an inclusive and unified world.

ABOUT THE EDITORS

Dr. Marian de Souza is a Senior Lecturer, student adviser and Acting Editor of the *Journal of Religious Education*. Her research is in contemporary understandings of spirituality, addressing young people's spirituality in education, using an arts-based approach to promote learning across the curriculum, and investigating how ethnic groups in a pluralist society hand on their cultural and spiritual heritage.

Gloria Durka Fordham University, New York, USA.

Kathleen Engebretson, is an Associate Professor in the school of Religious Education at Australian Catholic University. She is a teacher, writer, researcher, curriculum developer and academic in the field of religious education theory and practice. Her research interests include all aspects of religious education curriculum and pedagogy, and in recent years she has conducted research into issues surrounding teenage boys and religious and spiritual education. While working in secondary schools in Melbourne she played a leading role in introducing religious studies courses into the senior secondary curriculum, and has continued to provide leadership and professional development for teachers who teach these courses.

Robert Jackson is Professor of Education and Director of the Warwick Religions and Education Research Unit at the University of Warwick (UK). He has directed a range of externally funded research projects on religious education and religion and childhood. He is currently involved in Council of Europe projects on intercultural education and religious diversity and intercultural citizenship and is leading the Warwick contribution to an EU project on religious education and social cohesion involving 10 European universities. His books include *Religious education: An interpretive approach* (Hodder & Stoughton 1997), *International perspectives on citizenship, education and religious diversity* (RoutledgeFalmer 2003) and *Rethinking religious education and plurality: Issues in diversity and pedagogy* (RoutledgeFalmer 2004). Since 1996 he has been Editor of the *British Journal of Religious Education*. He has a PhD degree from the University of Warwick and in 2006 was awarded the degree of DLitt by the University of Wales for his international research contribution to religious education.

Dr. Andrew G. McGrady is Registrar of the Mater Dei Institute of Education, Dublin City University. His teaching and research interests include faith-based schools in multi-cultural societies, the religious, spiritual and moral dimensions of culture and education, education for active citizenship in democratic societies, and the collaborative use of Information and Communications Technology.

ABOUT THE CONTRIBUTORS

Maria da Conceição Azevedo is full professor of Philosophy of Education at the Education and Psychology Department, Universidade de Trás-os-Montes e Alto Douro, Portugal. Her doctorate thesis was on the Portuguese poet Fernando Pessoa as a contemporary educator and universal master. Her main research interests are Moral and Spiritual Education.

Dr. Linda L. Baratte is Director of the Centre for Theological and Spiritual Development, a lay ministry formation and continuing education program in the Roman Catholic tradition at the College of Saint Elizabeth, Morristown, New Jersey, U. S. A. She is also a member of the Department of Theology at the College.

Joyce Bellous is Associate Professor of Lay Empowerment and Discipleship at McMaster Divinity College, McMaster University in Hamilton, Ontario. She has taught at the College since 1993. She teaches and researches in the areas of spirituality, ethics, postmodernism and multiculturalism. She is a consultant, speaker and writer for church congregations, seminaries and denominational leaders on the subjects of leadership and ministry education. Her special interest is children and spirituality. She published *Gardening the Heart* (2005), a book of forty devotions on the life of faith and her monograph on spiritual formation titled *Educating Faith* is forthcoming from Clements Publishing (2006).

Inga Belousa is a professor of education and director of a Master's degree Program in Pedagogy at the Faculty of Education and Management, Daugavpils University, Latvia. Her current research addresses issues of philosophy of education, holistic education, and spirituality in education.

Dr. Lucia Berdondini, PhD, Developmental Psychologist, Gestalt Therapist, Research Fellow at the University of Brighton and co-manager of the Working With Others Research and Education Unit. Lucia's research interests are focused on whole school anti-bullying projects (in Italy and UK), implementation of group work skills in pupils of primary and secondary schools, social inclusion, training and support for teachers and teaching assistants.

Sherry H. Blumberg earned both her Master's and her PhD in Jewish education at Hebrew Union College in Los Angeles. Currently the Education Director at Congregation Am Echod in Lindenhurst, Illinois, she also serves as adjunct professor at both University of Wisconsin-Milwaukee and St. Francis Seminary in Milwaukee. She was formerly an Associate Professor of Jewish education for 14 years at Hebrew Union College in New York. An innovative Jewish educator for over 36 years, and a co-founder of the Jewish family education movement, she works extensively in the areas of curriculum design, teaching about God and spirituality, informal education, and interreligious dialogue. Dr. Blumberg is listed in *Who's Who in the World* and is a past president of the Religious Education Association of North America. She currently serves as Vice President for Educational Resources of the Coalition for the Advancement of Jewish Education. In Milwaukee, she is a member of the Milwaukee Catholic-Jewish Conference and serves on the board of the Coalition for Jewish Learning.

Michael T. Buchanan is a lecturer in Religious Education at the Australian Catholic University. He has published both nationally and internationally in the field of leadership, management and implementation of curriculum in religious education. His research interests focus on the exploration of factors which impede and assist change in the implementation of curriculum in religious education.

Sandra Carroll lectures in Religious Education at the Strathfield Campus of the Australian Catholic University, Sydney. Her doctoral thesis from San Francisco Theological Seminary was titled 'Teaching about Mary: Professional Development for Religious Educators'. Sandra is married with two teenage sons.

Dr. Eoin G. Cassidy, a priest of the Dublin Archdiocese, is Head of the Department of Philosophy, Mater Dei Institute, Dublin City University. His research interests include: the Philosophy of Friendship, Faith and the challenge of Culture, and Modernity, Post Modernity and Religious identity. His recent publications include: with Leask, I. (Eds.) (2005), *Givenness and God: Question of Jean-Luc Marion*. In the series 'Perspectives in Continental Philosophy', New York: Fordham University Press; (2002), *Measuring Ireland: Discerning Values and Beliefs*, Dublin: Veritas, and, with McGrady, A.G. (Eds.) (2001) *Media and the Marketplace: Ethical Perspectives*, Dublin: Institute of Public Administration.

Dr. Mark Chater is Reader in Education at Bishop Grosseteste College, Lincoln, UK. He is a religious educator with twenty years' experience in secondary and higher education. His current interests are in spirituality and values in education. He is a member of the International Seminar on Religious Education and Values (ISREV), book reviews editor of the *International Journal of Children's Spirituality*, and editor (with Cathy Ota) of *Spiritual Education in a Divided World* (Routledge/Taylor and Francis, 2006).

David Chidester is professor of religious studies and director of the Institute for comparative religion in South Africa at the University of Cape Town. His publications include *Savage Systems: Colonialism and Comparative Religion in Southern Africa*, *Christianity: A Global History*, and *Authentic Fakes: Religion and American Popular Culture*.

Jennie Clifford PhD is a consultant on Religious Education and Faith Formation and the Director of Presentation Global Education Experience. While ministering as a chaplain at University College Cork she carried out an in-depth study of the place of religion in the life of the young adult students.

Maria Helena Gil da Costa teaches at Universidade Católica in the areas of education, creativity and sociology, is a member of the Red Internacional de Motricidad Humana research group, represents The Creative Problem Solving Group, Inc. (Buffalo - USA) in Portugal, and served as principle of a teacher training college for sixteen years. Her current research is in adult education, particularly in the subject of fear and human development.

Dr. Leonie Crotty rsm is Head of Religious Education for the Catholic schools of the Archdiocese of Sydney, Australia. She is a member of the congregation of the Sisters of Mercy. Areas of work in her portfolio include the theological and spiritual formation of teachers and leaders in Catholic schools and the provision of curriculum and resources for classroom Religious Education. Leonie's particular interest is leadership in Catholic schools in the context of changing cultural, ecclesial, religious and educational realities.

Sandra Cullen is formerly a teacher of Religious Education and English at Second Level, Sandra Cullen now lectures in Contextual Theology at Mater Dei Institute, Dublin City University. She was Joint Coordinator of the *Logos* Project. She is the author of *Religion and Gender* (Dublin: Veritas, 2005). The focus of her doctoral research is the development of an appropriate model of religious education for those preparing to be religious educators.

Dr. Jorge Diez is the executive director of Hablemos de Cristo, Inc. He has worked for several years as a religious educator in various educational settings, and has vast experience in multicultural religious education with the Latino community in the United States. He has also published materials on the topic of adult religious education for Latinos.

Dr. Veronica (Rose) Duffy csb is the Head of Mission Services/Religious Education at the Catholic Education Office, Diocese of Sale, Australia. Her research is in the fields of Theology and Pastoral Ministry. More specifically, her current research is in adolescent spirituality and in religious art.

Dr. Tony Eaude was headteacher of a multi-ethnic Church primary school in Oxford, U.K., for nine years. Having completed a doctorate into how teachers of young children understand spiritual development, he is now freelance consultant, remaining associated as a Research Fellow with the Department of Educational Studies, University of Oxford.

John L. Elias is Professor of Pastoral Studies and Religious Education in the Graduate School of Religion and Religious Education, Fordham University, USA. His recent publications are *Philosophical Foundations of Adult Education* (2005) and *A History of Christian Education* (2002). His present research focuses on early 20th century American Catholic religious educators.

Dr. Graham English teaches in the School of Religious Education at the Australian Catholic University, Strathfield, New South Wales. He has taught in primary and secondary schools and for some years worked in the Catholic Education Office, Sydney, where he provided professional development for teachers in Religious Education, and where he wrote curriculum material as well as policy aimed at the continuing education in religion of teachers in Catholic schools. He has written school texts in religious education, as well as material to support adult religious education. He is also a published cartoonist and illustrator. His research areas and published articles include religious education curriculum, the educational thought of John Dewey, critical theory, the history of religious education in Australia, what it means to be Catholic in Australia, cartooning, and Zen Buddhism. After completing teacher training with the Christian Brothers he has graduated from the Australian National University, the National Pastoral Institute, the University of Lancaster and the University of Sydney.

Clive Erricker is Hampshire County Inspector for Religious Education in the UK and Visiting Research Fellow at the University of Winchester, UK. His research interests are pedagogy in religious and spiritual education and generational issues concerning religious and cultural transmission in the contemporary world. He is co-director of the *Children and Worldviews Project* and joint editor of the *International Journal of Children's Spirituality*.

Mireille Estivalezes is a historian and sociologist of religions. She has a PhD from the Ecole pratique des hautes études (Paris) on the teaching of religion in the French lay education system. A member of the Sociology of Religion and Laicity Group (EPHE-CNRS), she has published *Les religions dans l'enseignement laïque* (2005) and contributed to the collected work *La laïcité a-t-elle perdu la raison?* (2001).

Anta Filipšone holds a PhD in Religious Education from Fordham University, NY, USA and currently is Lecturer in Systematic and Practical Theology, Faculty of Theology, University of Latvia, Riga, Latvia.

Dr. Dorothea Filus is a research fellow at Monash University Japanese Studies Centre in Australia, where she received her PhD in 2000. She specialises in religion and society in contemporary Japan. She lived in Japan for almost six years during which time she studied, worked and conducted extensive research on Japanese religions, social stratification, globalisation and religious education.

Gary Finlay is Director of the National Centre For Religious Studies, an agency of the New Zealand Catholic Bishops' Conference. He was Editor/Coordinator for *Understanding Faith*, the religious education programme for Catholic secondary schools in New Zealand. He has been engaged in curriculum development in religious education since 1985.

Dr. G. P. (Joe) Fleming has worked in Religious Education Consultant for over thirty years as teacher, administrator and academic. He has been appointed the Cardinal Basil Hume Visiting Scholar to Cambridge University for the Lenten period of 2006. His academic interests are in the understanding of the nature and purpose of religious education and what this means for religious education curriculum in schools and parishes. In addition, his doctoral and post doctoral interests have focused on leadership in religious education, on issues surrounding appropriate teacher education for religious education teachers, and on the development of classroom religious education materials.

Namulundah Florence teaches at Brooklyn College's (CUNY) School of Education. Her *bell hooks' engaged pedagogy: A transgressive education for critical consciousness* addresses the challenges of cultural pluralism in the United States and Kenya. It received the American Education Research Award (AERA) Critics Awards as well as the Choice Outstanding Academic Title Award. The second book, *From our mothers' hearts: Bukusu folktales* focuses on education within informal settings.

Liam Gearon is reader in education and director of the Centre for research in human rights at Roehampton University (England); and a research associate at St. Thomas University, Canada. His areas of current research are in religion and human rights, and in freedom of expression.

Adrian Gellel is a lecturer in Catechesis and Religious Education at the University of Malta. He is particularly interested in research Divine Pedagogy, Individual Differences, and Adaptive Teaching. He is also actively involved in the planning and preparation of Catechesis and Youth Ministry in the Catholic Archdiocese of Malta.

Aileen Carlin Giannelli PhD counts it a joy and privilege to have been a student of Maria Harris in the Graduate School of Religion and Religious Education at

Fordham University. She holds a doctorate in Church Leadership from Fordham and serves as an adjunct professor in its School of Education.

Peta Goldberg is a senior lecturer in Religious Education in the Faculty of Education at McAuley Campus, Brisbane of Australian Catholic University. Her research interests are in the areas of religious education and the arts and the teaching of world religions.

Bruce Grelle is a professor in the Department of Religious Studies and Director of the Religion and Public Education Resource Centre at California State University, Chico. His areas of teaching and research are comparative religious ethics and religion and public education. Publications include the co-edited *Explorations in global ethics: Comparative religious ethics and interreligious dialogue* (1998).

Dr. Thomas H. Groome received his Doctorate in Religious Education from the joint graduate program of Columbia University Teachers College and Union Theological Seminary, New York in 1975. He also holds an MA in Religious Education from Fordham University and the equivalent of an MDiv from St. Patrick's Seminary, Carlow, Ireland. His books include *Christian Religious Education* (Harper, 1980), *Sharing Faith* (Harper, 1991), *Educating for Life* (Crossroads, 2000), and *What Makes Us Catholic* (Harper, 2002). Tom is a senior Professor of Theology and Religious Education at Boston College and currently serves as Director of BC's Institute of Religious Education and Pastoral Ministry.

Tobin Hart is a father, author, teacher, psychologist, and speaker. He serves as Professor of Psychology at the University of West Georgia and is President of the ChildSpirit Institute, a nonprofit educational and research hub exploring and nurturing the spirituality of children and adults (www.childspirit.org). His work examines consciousness, spirituality, and education.

Harold D. Horell is Assistant Professor of Religious Education at the Fordham University Graduate School of Religion and Religious Education. Dr. Horell teaches courses in moral education, social ministry, and the development of children and youth. He has written on Christian moral education and on postmodernity and religious education.

Philip Hughes is the senior research officer at the Christian Research Association (Australia) and a research fellow at Edith Cowan University. His research has focussed on changes in Australian culture and religious faith and, most recently, on the spirituality of youth. Philip is ordained in the Uniting Church in Australia.

John M. Hull is Honorary Professor of Practical Theology in the Queen's Foundation for Ecumenical Theological Education in Birmingham and Emeritus Professor of Religious Education at the University of Birmingham in England. As

well as his BA and BEd from Melbourne, he has an MA from Cambridge and a PhD from Birmingham. He has an hon. D Theol from Frankfurt and an honorary doctorate from the Vrije Universiteit Amsterdam. He is the General Secretary of the International Seminar on Religious Education and Values. His current interest is in the theological education of adults. His web site is www.johnmhull.biz.

Anne Hunt, Associate Professor is a lecturer in systematic theology at Australian Catholic University and at Yarra Theological Union (Melbourne) and Rector of the Ballarat Campus of Australian Catholic University. She is the author of a number of articles and books, most recently *The Trinity: Nexus of the Mysteries of Christian Faith* (Orbis, 2005).

Brendan Hyde is a lecturer in religious education at Australian Catholic University in Melbourne, Australia. His research interest is in the spirituality of young children, and in using hermeneutic phenomenology as a framework for reflecting upon children's spirituality.

Dzintra Ilisko, PhD, is a graduate of Fordham University. She is currently a lecturer at Daugavpils University, Latvia, Faculty of Education and Management, Department of Pedagogy. Her interests include: sustainable education, multicultural, adult education, gender studies, value education, and she has published on these topics.

Recep Kaymakcan is associate professor of religious education in the Faculty of Theology at the University of Sakarya, Turkey. His main research interests are in curriculum development and evaluation in religious education, comparative religious education, teaching Christianity in Turkey, values education together with recent empirical research into religiosity and life perspectives among Turkish adolescents.

William K. Kay is an Assemblies of God minister, and Director of the Centre for Pentecostal and Charismatic Studies Reader in Practical Theology, Department of Theology and Religious Studies, University of Wales, Bangor. Prior to this appointment he was a Senior Lecturer in the Department for Education and Professional Studies at King's College, London, and before this he was Senior Research Fellow in the Centre for Theology and Education, Trinity College, Carmarthen. Before his appointment at Trinity College Carmarthen, William was a lecturer at Mattersey Hall near Doncaster. William's main research areas are Pentecostal and charismatic theology and history, religious education, church schools, religious development, psychology of religion, and Piagetian psychology.

Dr. Ross Keating is a senior lecturer within the Faculty of Education at Australian Catholic University. His research interests include the use of poetry in awakening

students to an experience of consciousness that challenges existing notions of meaning and purpose and as a medium for contemplative expression and insight.

Anthony J. Kelly, CSsR, after serving as Dean of Theology at Australian Catholic University, is now a Professorial Fellow attached to the Institute of Theology, Philosophy and Religious Education. His special concern for an interdisciplinary theology has occasioned numerous publications dealing with theological connections to philosophy, biblical studies, science, psychology, literature and religious education. He was appointed by Pope John Paul II to the thirty-member International Theological Commission.

Paul King lectures in Chaplaincy Studies at the School of Education Studies, Dublin City University. He has also worked as a teacher of religious education, a chaplain and a guidance counsellor in a number second-level schools in Ireland. His current research is on the role of guidance in education.

Dr. Dermot A. Lane, a priest of the Catholic Archdiocese of Dublin, is President of Mater Dei Institute of Education, Dublin City University. His research interests include Interreligious Dialogue, Christology, and Eschatology. Author of *Keeping Hope Alive: Stirrings in Christian Theology* (1996/2005) and *The Experience of God: An Invitation to do Theology*, revised and expanded edition 2003 and editor of *Catholic Theology Facing the Future: Historical Perspectives* (2003).

Dr. Sally A. Liddy, is a Senior Lecturer, Signadou Campus, Australian Catholic University. Research interests: eco-theology; Christian spirituality; teaching undergraduate religious education and theology; faith formation of young women.

Dr. Anne Looney is Chief Executive of the National Council for Curriculum and Assessment (NCCA) in the Republic of Ireland. Her research interests include religious and moral education, assessment, and the impact of globalisation on education policies. Her recent publications include Looney, A. (2001) Curriculum as policy: some implications of contemporary policy studies for the analysis of curriculum policy, with particular reference to post-primary curriculum policy in the Republic of Ireland. *The Curriculum Journal* 12(2), 149–162, and Looney, A. (2003), The Pilgrim School: From hedge to hope. In Prendergast N. and Monahan, L. (Eds.), *Reimagining the Catholic School* (pp. 232–245). Dublin: Veritas.

Terence Lovat is professor of education and pro vice-chancellor at The University of Newcastle, Australia. He has taught and researched in religion, ethics and religious education over many years. His recent research interests have been in religious movement, especially with and between mainstream religions (especially Hinduism and Islam) and new religious movements.

Patricia Malone rsj is an Adjunct Professor of Australian Catholic University in the School of Religious Education where she taught full time for more than twenty years. At present she is a member of the leadership team of her religious congregation, the Sisters of St Joseph. Her field of teaching and research is curriculum development and religious education within the Australian context. Pat has played a leadership role in the field of religious education in Australia.

Joseph McCann C.M. PhD is a priest and religious educator. He was Head of Religion in St Patrick's College, Drumcondra, Dublin, currently teaches management of pastoral and voluntary organisations at All Hallows College, Dublin, and serves as visiting professor at DePaul University, Chicago. His research concerns the management of ethos, the institutionalisation of religion, and Catholic education.

Roseanne McDougall SHCJ, EdD, a sister of the Holy Child Jesus and Assistant Professor of Religion at LaSalle University in Philadelphia, USA, teaches Educational Philosophy to religious and laity during the August Long Vocation in Nigeria. Roseanne holds a doctorate in religion and education from Teachers College Columbia University in New York.

Dr. Wilna A.J. Meijer is Senior Lecturer in the Philosophy of Education in the Department of Theory and History of Education of the University of Groningen, the Netherlands and Visiting Professor in the Philosophy of Education at the University of Gent, Belgium. Her recent research interests include Islam and Education, and Humanities Education.

Siebre Miedema is Hendrik Pierson Professor for Christian Education, Professor of Educational Foundations in, and Dean of, the Faculty of Psychology and Education, and Professor of Religious Education in the Faculty of Theology, Vrije Universiteit Amsterdam, the Netherlands.

Mary Elizabeth Moore is professor of religion and education, and director of women in theology and ministry, Candler School of Theology, Emory University, USA. Her interests centre on education, process and feminist theologies, justice and reconciliation. Writings include *Ministering with the Earth*, *Teaching from the Heart* and *Teaching as a Sacramental Act*.

Gabriel Moran is a professor in the Department of Humanities and the Social Sciences, New York University. He has written on religious education and related topics for over forty years. Among his twenty books are *Religious Education as a Second Language*, *Showing How: The Act of Teaching* and *A Grammar of Responsibility*.

Vivienne Mountain has been involved in education at primary secondary and tertiary levels of teaching in both the secular government sector and in independent schools sponsored by the Christian faith tradition. Her academic qualifications include education, theology, multicultural education, philosophy, religion and student welfare. Vivienne is currently Chaplain at Firbank Grammar, a large independent Girls' school in Melbourne Australia.

Eleanor Nesbitt is reader in religions and education in the Institute of Education, University of Warwick, England. Her research interests include religious identity formation, and Hindu-related movements and values education. Her publications include: *Sikhism: A Very Short Introduction* (2005, OUP) and *Intercultural Education: Ethnographic and Religious Approaches* (2004, Sussex Academic Press).

Karl Ernst Nipkow, born 1928, is an emeritus professor who taught Practical Theology with an emphasis on Christian and religious education at the Protestant Faculty of Theology at the University of Tübingen from 1968–1995. He is also an educationist who taught at the Faculty of Social and Behavioural Sciences at the same university. Among his numerous books (also in Russian and Korean) his recent English written publication is *God, Human Nature and Education for Peace. New approaches to Moral and Religious Maturity*. (Aldershot 2003, Ashgate).

Lucinda A. Nolan earned the PhD in Religious Education from Fordham University in 2004. She has taught theology at Lewis University in Illinois and catechetical studies at Santa Clara University in California. She is currently teaching Religious Education and Catechetics at The Catholic University of America.

James Norman is a Lecturer in the School of Education Studies, Dublin City University where he has been central to the development of post-graduate programmes in teacher education, chaplaincy and pastoral care. He is the author of *Ethos and Education in Ireland* (New York: Peter Lang, 2003) and editor of *At The Heart of Education: School Chaplaincy & Pastoral Care* (Dublin: Veritas, 2004).

Dr. Mary Nuttall rsm is a lecturer in the fields of teaching and classroom management, teaching students with special needs and curriculum development. Her research focuses on soulful learning in which creative steps are taken to develop holistic curriculum programs in collaboration with staff and students within primary, secondary and tertiary education contexts.

Sissel Ostberg is associate professor and dean at the Faculty of Education, Oslo University College, Norway. Her research interests are in religious education, religious and ethnic identity, and Muslim children and young people in Norway.

Cathy Ota is Senior Research Fellow at the Education Research Centre at the University of Brighton, UK and co-editor of the *International Journal of Children's Spirituality*. In September 2004 she established the Working With Others Research and Education Unit with her colleague Lucia Berdondini, at the University of Brighton. The unit works nationally and internationally with pupils, teachers, parents and staff teams, exploring and developing practical strategies to enhance group processes through self-awareness, social communication, peer support, problem solving and conflict resolution. Current research and work is focused on developing effective groupwork in early years and higher education settings.

Fernand Ouellet is full professor at the Faculty of Theology, Ethics and Philosophy in the University of Sherbrooke, Canada. His research interests are the study of religions in schools and intercultural education: in both areas he has published extensively.

The Rev. Mary Petersen is currently Ministry Leader, Mercury Bay Co-operating Parish, Coromandel Peninsula, New Zealand. She also teaches distance education courses that she has developed for Massey and Otago Universities and the Ecumenical Institute of Distance Theological Studies, in *The Teaching of Religious Education, Curriculum Development, Shaping Religious Education, and Ministry with Children and Families*. She was the National Coordinator of Ministry with Children and Families for the Presbyterian Church of Aotearoa New Zealand (2001–2004) and General Secretary of the Churches Education Commission (1990–2000). She was a teacher in secondary and primary schools for 12 years between 1970 and 1990.

Sue Phillips is Head of RE and an Advanced skills Teacher at Bognor Regis Community College, a large comprehensive school for pupils aged 11 to 18 in the Southern England. She is also Professional Tutor overseeing the training of teachers in a variety of subjects and a counsellor. Sue regularly mounts day courses at her school in Theatre of Learning techniques and presents conferences on the techniques throughout the country.

Jack Priestley is Honorary Research Fellow in the University of Exeter School of Education and Lifelong Learning (U.K.). Formerly, he was Principal of Westhill College of Higher Education, Birmingham. He has a lifelong active interest in the history and philosophy of religious education as well as in the practice of teaching.

Dr. Caroline Renehan is a lecturer in the School of Education of the Mater Dei Institute of Education, Dublin City University. Her research interests include Marian and feminist theology, and Gender Studies in the context of Initial Teacher Education. Her recent publications include:(2004a) 'Religion and Gender' in *Religious Education Syllabus Leaving Certificate Draft Guidelines*

for Teachers, Dublin, Department of Education and Science, Government Publications Office; (2004b) 'Religion and Gender' in *Guidelines for the Faith Formation and Development of Catholic Students - Leaving Certificate Religious Education Syllabus*, Dublin: Irish Catholic Bishops' Conference, Veritas; and (with Monahan, L, 1998) *The Chaplain: A Faith Presence in the School Community*, Dublin: Columba Press.

Graham Rossiter is Professor of Religious and Moral Education at Australian Catholic University in Sydney. He has conducted professional development seminars throughout Australia and in a number of other countries and has published widely. Current interests are: young people's search for meaning and identity, the spiritual and moral influence of film and television, values education. His next book on Religious Education is titled *Reasons for living: Education and young people's search for meaning, identity and spirituality*.

Cornelia Roux is a Professor in Department of Curriculum Studies, Faculty of Education, University of Stellenbosch in South Africa. Her research projects and interests are: Religion Studies: diversity and inclusivity; children's religious development; religion and cultural diversities; human rights and religions and belief and values systems in multicultural societies.

Richard Rymarz is a lecturer in religious education at Australian Catholic University, St. Patrick's Campus, Melbourne. He has longstanding research interests in how religious beliefs and culture are passed on. He has published widely on religious identity and young adults.

Peter Schreiner is educational researcher at the Comenius-Institut, Protestant Centre for Research and Development in Education. He is also President of the Intereuropean Commission on Church and School (ICCS). Research interests in the field of comparative religious education, education and Europe and intercultural education. Information about his publications available through. www.comenius.de

Daniel G. Scott, Assistant Professor and Graduate Advisor, School of Child and Youth Care, University of Victoria in British Columbia, Canada focuses his research on the spiritual life experiences of children and youth particularly early adolescent experience, including rites of passage.

Prof. Mualla Selçuk is the Dean of the School of Divinity at Ankara University where she teaches. Her research interests are:

- New Approaches to teaching about and from Islam
- Religious concepts (Children's understanding of)
- Peace Education
- Interreligious Education

Geir Skeie is associate professor at the Faculty of Arts and Education, University of Stavanger, Norway, where he teaches religious studies and religious education. His research interests are theoretical questions related to the philosophy of religious education, with particular emphasis on issues related to modernity, pluralism and identity.

Joanmarie Smith, CSJ, recently retired from the William A. Chryst Chair of Pastoral Theology at the Methodist Theological School in Ohio. Currently, she is the Director of Spiritual Formation for Local Pastors. Her most recent books are *A Context for Christianity in the 21st century* and *The joy of teaching*.

John Sullivan Liverpool Hope University is a joint Anglican and Catholic liberal arts foundation, ecumenical and inclusive in spirit, with 7000 students. John Sullivan's current research interests include interconnections between theology and education; the nature of a Christian university; the religious thought of Maurice Blondel; how spirituality relates to scholarship.

Dr. David Tacey is Associate Professor in the School of Critical Enquiry, La Trobe University, Melbourne. He teaches courses on spirituality, analytical psychology and literary studies. He is the author of eight books and eighty-five essays, and his most recent book is *The Spirituality Revolution: The Emergence of Contemporary Spirituality*, London and New York: Routledge, 2004.

Ann M. Trousdale is an Associate Professor at Louisiana State University. Her research interests include how children's literature may be used to foster children's spiritual growth and religious understanding, socio-cultural analysis of children's literature, and reader response to literature. She is a Deacon in the United Methodist church.

Anton C. Vrame, PhD is associate Professor of Orthodox Christian Studies at the Graduate Theological Union and Director of the Patriarch Athenagoras Orthodox Institute in Berkeley, California. He is a leading scholar in Orthodox Christian religious education for the Greek Orthodox Church in America.

Dr. Kevin Williams is Senior Lecturer in the School of Education, Mater Dei Institute, Dublin City University, and a former president of the Educational Studies Association of Ireland. Recent publications include *Faith and the Nation: Religion Culture and Schooling in Ireland* (Dublin: Dominican Publications, 2005). The research for this chapter was supported by a grant from the Irish Research Council for the Humanities and Social Sciences.

Jane Erricker Winchester is an Associate Dean in the Faculty of Education, University of Winchester. She teaches science and citizenship and researches children's spirituality with Clive Erricker and Cathy Ota. Together they founded

the International Journal of Children's Spirituality and initiated the annual conferences on Children's Spirituality.

Andrew Wright is senior lecturer in religious and theological education and coordinator of the Centre for Theology, Religion and Culture at King's College, London, England. His research interests are: religious and spiritual education, theological literacy, pedagogy and hermeneutics, critical realism and educational philosophy, theology of education, Christian formation.

T. John Wright retired in 2005 as dean of the College of the Southern Cross, St. John's College, Auckland and as lecturer in theology, University of Auckland.

SECTION ONE

INTRODUCTION TO SECTION ONE: PHILOSOPHICAL/THEORETICAL DISCOURSES ON THE RELIGIOUS, MORAL AND SPIRITUAL DIMENSIONS OF EDUCATION

Gloria Durka

Fordham University, New York, USA

The essays in this section require the reader to think very carefully about what it means to educate. They assert that it is the responsibility of educators to continually face this demand. This requires that educators be active and critical, taking nothing simply on authority but insisting on testing every theory by references to human experience.

As John Dewey (1997; 1910) put it, ‘While it is not the business of education to prove every statement made, any more than to teach every possible item of information, it is its business to cultivate deep-seated and effective habits of discriminating tested beliefs...and to ingrain into the individual’s working habits methods of inquiry and reasoning appropriate to the various problems that present themselves’ (pp. 27–28). Dewey claimed that unless one had such attitudes and habits, she or he was not intellectually educated. For Dewey, the main office of education is to supply conditions that make for their cultivation. Philosophical inquiry helps to clarify and augment responses to issues and concerns on the religious moral and spiritual dimensions of education. As Jeff Astley (1994) writes, ‘Philosophy as a method is primarily an attempt to think clearly: to clarify concepts and to examine arguments’ (p. 2).

Sound educational practice is grounded on the foundation of theory either intentionally or unintentionally. And good theories of education are clearly thought through and empirically grounded. While some would argue that there are teachers who can come to teach very effectively without ever being consciously aware of what they are doing, this is accidental. Teachers who do not understand the models on which their methods are based, are confined to doing what their unexamined habits direct them to do. Thus, they are not the authors of their actions. Marc Belth (1965) asserts that if teachers are to comprehend the grounds for their

work in order to improve the relationship between act and intention, and recognise consistency and adequacy in their teaching, they must study the models on which their actions or methods are based. He points out that to study models is to raise the educating act to the level of theoretical inquiry and to make it possible to improve action by deliberative study (pp. 168–169). As Astley reminds, philosophy is a method of thinking...applied to a particular range of issues and problems (p. 21).

The topics treated in this section are philosophically interesting, and they deal with issues related to the substantive content of the educational process. The section is divided into four parts. Part one addresses some philosophical perspectives on religious education. Part two presents certain feminist concerns and contributions to the religious, moral, and spiritual dimensions of education. The third part contains essays on the educational significance of spirituality. The fourth section includes essays which highlight some emerging theoretical issues and critical concerns which have bearing on the religious, moral, and spiritual dimensions of education.

Part 1: Philosophical Perspectives on Religious Education

There are seven essays in this part which offer varying philosophical perspectives on religious education. The authors are from the United States, England, Latvia and New Zealand. The first essay, 'Ancient philosophy in religious education: Education as initiation into a way of life,' is written by John L. Elias who is from the United States. As one who has published numerous works on various aspects of the philosophy of education, he draws from a rich palette. Elias suggests that the west has witnessed a continuing separation of philosophy from religion, and knowledge from faith. The result is that philosophy is now primarily viewed as a discipline committed to understanding the world in rational and secular terms. Because education in general and religious education in particular has been greatly influenced by this separation, many of religious education's aims are restricted to explanation and understanding. His essay explores the thesis that religious education can benefit from a retrieval of the ancient view of philosophy which invites persons into a spiritual way of life. The essay, 'Christian education and the reconstruction of Christian faith,' by John Hull, attempts to grasp the dilemma that religious and economic globalization presents to Christian educators regarding how to hold an adequate and appropriate self-understanding. The author employs a combination of theological assertion and historical interpretation, commencing with a series of theological fundamentals springing from faith in God as living God of Christian tradition.

In discussing the tension between religion and the nation-state in the modern era, Gabriel Moran discusses how today's religious education has to include dialogue both with other religions and with secular political powers. In his essay, 'Religious education and the nation-state,' he posits that a religious group has to work with its own members to sustain an appropriate tension with the nation-state.

Yet another dilemma is explored in the essay by Joanmarie Smith. In her piece, ‘The dilemma of pluralism,’ she draws attention to an alternative theory of truth between certitude and relativism. She describes an approach to teaching which can resolve the dilemma of either claiming that truth is not known in the way it is usually used—the correspondence theory—or that there is no truth in that sense.

Closely related to which truth is to be taught is the question of why something should be taught, i.e., how relevant it is. Gary Finlay asks the question, what is meant by ‘relevant’ in the context of Catholic schools in particular, or schools of other religious traditions in general. He cites the concept of the Maori people of New Zealand named *turangawaewae* which literally means ‘a standing place for the feet’ and refers to the sense of place and security given to Maori by their sharing in ancestral rights. Similarly, Finlay argues, students deserve to be taught ‘where they stand,’ and while the immediate experience of students should be considered, schools should find a balance in which there will be place for the deliberate and judicious attempt to pass on the tradition of their religious bodies.

Based on the premise that we confront increasing moral plurality and ambiguity in our lives and world today, Harold Horell argues for a more expansive and holistic understanding of morality, moral education, and Christian moral education. His essay, ‘The moral demands of contemporary life and Christian moral education’ explores contemporary moral experience; the personal, social and global/environmental horizons of ethical thought and action; the dynamics of moral development; and questions about the distinctiveness of Christian moral perspectives. In light of these foundational considerations, an approach for Christian moral education is offered.

The final essay in this part considers the contributions of the contemporary U.S. philosopher, Ken Wilber, and his possible contributions to religious education. Writing from the eastern European country of Latvia, Anta Filipsons sketches the key elements of Wilber’s integral approach to philosophy, cultural studies, psychology, and spirituality. She proposes to offer an introduction into the heart of Wilber’s theory—the four-quadrant framework—and suggests some of its application to the process of religious education. Although her essay engages only one model of religious education, Filipsons suggests that the conversation can and should expand much further. As well, she posits that Wilber’s framework can become a common metatheoretical foundation for various educational models and methods.

Part 2: Feminist Concerns and Contributions

Some would argue that feminism is the most sweeping revolution of the last half century because it is part of the fabric of injustices toward all minority groups. Yet, the depth of its implications is still being probed. As in all social justice issues and movements, the experience of working at it has gradually clarified and deepened the issues. Using a feminist lens, the four authors in this section propose ways in which the theory and practice of religious education can be enhanced by feminist principles. Two of the authors write from their experience of being citizens of the

United States, one as a native of Kenya who is currently teaching in the US, and the other from Eastern Europe as a scholar teaching in a Latvian university. All four draw from feminist principles which challenge fundamental assumptions, forged out of the Enlightenment, about how knowledge is obtained and shaped. Their essays illustrate why religious educators should be aware of the biases introduced by a too easy acceptance of conventional categories and models. These authors agree that a feminist appropriation of any philosophical system or educational theory will be creative, i.e., active, critical, and imaginative. It will be open to new ways of thinking but will take nothing on authority; and it will insist on testing every hypothesis by reference to the immediate experience of women (cf. Durka, 1982; 1991).

In her essay, 'Dialogue to truth in bell hooks and Jane Roland Martin,' Florence Namulundah unpacks how the theories of both scholars demonstrate an inextricable link between abstract thought and students' lived experiences; academic pursuit and creating a just society; individual interests and social concerns. Although hooks and Martin do not employ explicit religious language, Namulundah points out that there is a moral ethic evident in their treatises that affirms the individual albeit not at the expense of the larger community, and an intellectual pursuit that integrates the affective. She concludes her essay with a consideration of the centrality of teachers in students' cognitive and character development. Latvian scholar Dzintra Ilisko explores 'Ecofeminism—a healing perspective for reshaping religious education.' She draws on several ecofeminist theologians who reinterpret classical teachings regarding God and the world while reinterpreting them from a feminist perspective. Ilisko proposes challenges to religious education, and applies principles and insights from ecofeminist theological thought for reshaping religious education.

The second half of this section contains essays on the impact of two women who have made monumental contributions to the theory and practice of religious education. A self-proclaimed feminist, Maria Harris' work embodied much of what feminism promises, most especially critical thinking alongside a rich imagination. Aileen Giannelli uses three lenses to examine Harris' work: the rhythm of teaching and learning, the nature of knowing, and the creating of community. Each of these lenses have been central themes in feminist pedagogy. But there are those women educators who, while not proclaiming themselves to be feminists, nevertheless embody essential characteristics of feminist pedagogy. Sophia Lyon Fahs was such an educator who re-examined and revised theological understandings, and who embraced an ongoing process of critical reconstruction of philosophy of religious education. Her courage and willingness to venture into new realms of experimental methods were grounded in an active imagination. Her contributions to the religious education enterprise are unfolded in the essay by Lucinda Nolan.

Part 3: Essays on the Educational Significance of Spirituality

The search for a relevant and meaningful spirituality in the new millennium is shared by people from diverse parts of the globe as seen in the essays in this section. Scholars from Australia, Canada, and Europe address aspects of the educational

significance of spirituality. Joyce Bellous shows how faith operates in human lives by exploring conceptual relationships among the terms faith, spirituality, and education. She proposes that from the point of view of Christian education, spirituality provides the opportunity to know God, and that educators are called to nurture this potential in the life of every ordinary person.

Most teachers are very aware of the difficulties involved in socialising young and old into the traditions of a religious body in an era of cultural and religious pluralism. The essay of Australian religious educator Graham Rossiter invites teachers to subject their models and methods of spirituality to critical examination. He offers suggestions of how to avoid eclecticism which masks intellectual confusion. The essay concludes with a scheme for the appraisal of the appropriateness of any particular offering labeled as spirituality. The essay which follows is also written by an Australian scholar. David Tacey probes 'Spirituality as a bridge to religion and faith.' He explores spirituality, which is about the personal experience of the sacred, as a vital and necessary bridge upon which lives can be reconnected with the traditional sources of wisdom known as 'religion.' The chapter by Inga Belousa of Latvia introduces a theoretical framework of spirituality as a pedagogical category that includes three aspects: existential, social and ultimate. The existential aspect explains a dimension of human reality either inherently possessed or given by God at birth. It reveals spirituality as a quality of essential need and experience of human nature. The social aspect describes a dimension of human reality that is attained and shaped by a variety of spheres such as education, culture, religion, and philosophy. The ultimate aspect expresses the transcendent nature of human being and the engagement in virtuous behaviors such as awareness, openness, connectedness, service, and harmony. It is manifested as an integration of the immanent and the transcendent.

Part 4: Emerging Issues and Critical Concerns

Theoretical inquiry addresses the issues of meaning and vision. The essays in this section draw upon some subjects which can help teachers to better understand some of the various powers and spheres of life that are emerging under globalising conditions. Each of the essays relate these issues and concerns to how educators could guide their responses to the complex reality of postmodern life. Challenges facing religious educators who work with Africans and Hispanics are especially addressed by Roseanne McDougall and Jorge Diez respectively. McDougall explicates the inherently religious dimensions of 'Sankofa,' a twenty-first century re-appropriation of indigenous education. It is an integral component of such an African philosophy of education which serves to reconnect West Africans with a deeper sense of their inherently religious consciousness. The article describes 'Sankofa' as an intermediate stage in the development of an African educational philosophy. As such, it offers valuable insight to non-African educators. At the same time, it is acknowledged that only an African would be truly in a position to contribute a perspective on more recent advances in African educational philosophy.

Born and raised in Colombia, South America, Jorge Diez writes from his perspective as a religious educator in a United States multicultural adult Latino community. He presents an augmentative pedagogy derived from the integration of several educational theories. He argues that the principal theoretical objective of this approach is to transcend the limits placed by theory so as to adapt theoretical principles in a way that can be translated into practical opportunities.

The urgency of peace education as a dimension of religious education is presented by Linda Baratte. She suggests that peacemaking requires religious educators to probe the ethical re-evaluation of war by critically analysing the works of modern theologians, moral philosophers and social thinkers. This process implies making accessible competing ethical claims, and an exploration of peace through positive appreciation of other religious traditions and their potential to be religious sources of peaceful transformation. The essay is replete with carefully nuanced evaluations of available educational resources for teaching peace and justice.

The section ends with a final essay in part four that examines the dilemma of how to preserve religious heritage while nurturing religious development within the Christian Orthodox tradition. In his overview of Orthodox Christian religious education, Anton Vrame names what such a task entails and notes that the foundational questions are the same for any religious body. The particular application of these answers will be unique to each religious body. For those engaged in Orthodox education, he suggests that the answer to Orthodox education be located in the icon of the living Christ, the artistic *parakatatheke* of the Orthodox tradition, which is handed forward to each person in the life of the community.

The essays in this section have the qualities of *pentimento*, i.e., a process of making visible that which has been painted over. By painstakingly scrutinizing and critiquing various facets of philosophical and theoretical issues on the religious, moral and spiritual dimensions of education, it is hoped that the authors have helped to make visible for the readers, richer and wider aspects of foundational issues in education.

ANCIENT PHILOSOPHY AND RELIGIOUS EDUCATION: EDUCATION AS INITIATION INTO A WAY OF LIFE

John L. Elias

Graduate School of Religion and Religious Education, Fordham University, USA

Introduction

Asked to write a paper on philosophy of religious education, I have pondered long and hard the complexity of the task. The first confusion, not easy to dispel, is with the word philosophy itself. Philosophy is not a univocal word since it means different things to its many practitioners. Western philosophy, which will be the focus of this paper, began as an attempt to go beyond the Greek poets in explaining the world and directing people's lives. Thus philosophy has always had a connection with education. It has also had for centuries a close connection with religion. My pondering the role of philosophy in religious education led me to review a life long study of philosophers and philosophies. In this review I will note how other religious educators have drawn on philosophy for their work. Next I will explain some of the main thrusts of ancient Greek philosophy. Finally, I will draw implications for theory and practice of religious education.

My introduction to philosophy came as a seminary student who was required to study philosophy for two years before beginning the study of theology. The philosophy of Neo-Scholasticism or Neo-Thomism, a modern version of the philosophy of the 13th century Dominican friar Thomas Aquinas, was to serve as *ancilla theologiae*, the handmaid of Scholastic theology. In studying the modern interpreters of St. Thomas and other 13th century philosophers the subjects were logic, epistemology, ontology or metaphysics, theodicy, philosophical psychology and ethics. The approach was rational, at times close to the reasoning and proofs one finds in mathematics. The most interesting course for me, however, was history of philosophy in which I was introduced in a year long course to the most prominent philosophers of the West. Each philosopher was critiqued according to how he (they were all men) agreed with or departed from the one true philosophy, which

was Neo-Scholasticism. I tired of the commentators on Thomas Aquinas and started to read his writings for myself, even using them in my examinations, to the consternation of some of my professors.

Though Neo-Thomism was once a great force in Catholic circles philosophising about education, notably the work of Jacques Maritain (1943), little scholarship in this tradition is carried on today, even though vibrant forms of Thomism have emerged in the last half of the twentieth century with the work of Karl Rahner and Bernard Lonergan (Elias, 1999). The anti-metaphysical thrust brought into modern philosophy by David Hume and others did much to blunt the influence of all forms of Thomism.

In the sixties I came to question the rigidity of Neo-Scholasticism and avidly read the existentialists, especially Albert Camus, Jean Paul Sartre, Gabriel Marcel, Martin Buber, Soren Kierkegaard, and Karl Jaspers. Some of these put their philosophies into narrative form which made reading them a more engaging enterprise. The plays of Eugene Ionesco and Samuel Beckett were also valuable for conveying the mood and main thrust of this philosophy. These between-the wars-philosophers of contingency, absurdity, existential angst, and relationships spoke both to me and the tumultuous times in which we were living.

Michael Grimmitt (1973) successfully mined this tradition in presenting an approach to religious education that focused on existential and depth themes. Various religious educators, both Christian and Jewish, have found in Martin Buber's writings an approach to religious education that touches on many existential themes (Hill, 1973). Though not a religious educator, Maxine Greene (1967; 1973) for years dialogued with these philosophers to reflect creatively upon many aspects of education.

At graduate school in the seventies I studied various forms of analytic philosophy. The rigor of Ludwig Wittgenstein, Gilbert Ryle, and John Wisdom, and the philosophers who utilised their works to reinvigorate the field of philosophy of education reminded me of the scholasticism of my college years. The analysis of language, concepts, slogans, metaphors, arguments and policies of these analysts provoked many lively discussions and classes. However, when it came to doing a dissertation I did not employ this approach but did a more traditional comparative and critical interpretation of the radical educational reformers Paulo Freire and Ivan Illich (Elias, 1976). These men, while certainly philosophers, were also social critics, political theorists, and educators.

A form of language analysis has been one of the principal tools Gabriel Moran has used to probe many issues in religious education, though one finds in his writings other philosophical stances, notably neo-progressivism. Charles Melchert (1974; 1978), Randolph Crump Miller (1970), and John Hull (1984) have also made use of forms of language analysis. The most recent work in this field is the carefully crafted philosophy of religious education of Jeffrey Ashley (1994) who draws on educators in Britain and the United States.

Graduate school also introduced me to a third contemporary philosophy, American pragmatism. I devoured John Dewey's *Democracy and Education* (1917)

and went on to read many of his works and have followed the still continuing debate over his ideas and influence. The pragmatism of Dewey and William James influenced me in many of my writings. Dewey figured prominently in my *Philosophy of Education* (1995), where it served as a bridge between the ancients and contemporary philosophers of education. Past issues of *Religious Education* have included many attempts to interpret religious education from a Deweyan perspective. The classic works in this area are those of George Coe (1918) and Sophia Fahs (1952).

My thesis on Paulo Freire and Ivan Illich made me take seriously the philosophical dimensions of Marxist thought and phenomenology (Elias 1976; 1994). Through them I also made contact with the critical social theory of the Frankfurt school. The most successful attempt to bring this approach to bear on religious education remains Thomas Groome's *Christian Religious Education* (1980). Michael Warren (1997) has also drawn on this thought for his criticisms of modern media and communications.

While teaching graduate courses in theology and theories of religious education I was attracted to the efforts of process philosophers to present a more dynamic approach to religious education (Durka & Smith, 1976; Moore, 1998). My interest in this form of philosophy was never strong since I had become disenchanted with all forms of absolutist metaphysics.

In more recent years I have grappled with various postmodernist philosophers and have recently written a chapter on the relevance of this thought to philosophy of adult education. Harold Horell (2003), my colleague at Fordham University, has fruitfully drawn some implications of postmodernist writers for religious education.

Reflecting thus far on religious education I have drawn over the years on a number of philosophical traditions. In doing so I am in the company of religious educators who have and do utilise these approaches. But I prefer in this piece to draw on ancient Greek philosophy because I believe that it may speak to the essential nature of what religious education, an invitation to embrace a particular way of life. Recent philosophies are an attempt to present or analyse a world view by probing human consciousness, language, culture. Religious education, however, is not primarily or essentially introducing people into a system of thought; it is rather an attempt to initiate and confirm students in a way of life.

Philosophy as a Way of Life

The ancients Greeks viewed philosophy as more than theoretical discourses or systems of thought. They were interested in philosophical modes of life, and spiritual phenomena. There is a certain advantage to going back to the origins of Western philosophy to see how the original thrust in philosophy developed. The ancient philosophers produced great theoretical works but almost always within the perspective of promoting and initiating others into a defined life. Philosophy was

an invitation to make an existential choice, a choice to be made not in solitude but in the context of a community. For the ancients:

the philosophical school corresponds, above all, to the choice of a certain way of life and existential option which demands from the individual a total change of lifestyle, a conversion of one's entire being, and ultimately a certain desire to be and to live in a certain way (Hadot, 2002, p. 3).

While this choice obviously entails acceptance of and commitment to a theory or vision of the world, its ultimate purpose is the adoption of a particular way of life in company with others. At the heart of the philosophical task of ancient philosophy was the effort to engage disciples in spiritual exercises that may include diet, discourse, dialogue, meditation, and contemplation (Hadot, 2002, p. 6).

Philosophy for the ancient Greek philosophers was a process and program of self-transformation. Hadot's thesis (2002) presents various steps in this self-transformation or conversion. Those who would be philosophers made an existential choice, a conversion from ordinary life to a life according to a particular philosophy. The would-be philosopher joined a particular school to learn and engage in the discourse and processes by which this transformation was fostered. Disciples then studied the physics, metaphysics and ethical theory that supported this particular philosophy. All the while disciples engaged in the spiritual exercises that fostered this world view and led to a fuller understanding of themselves. Through these discourses, study, and spiritual exercises disciples were transformed. Once transformed, disciples engaged others in order to encourage and aid them in making existential choices and further their transformation.

While the full approach to philosophy as a way of life is found in the Hellenistic schools of Epicureanism and Stoicism, important elements of this approach are also found in earlier philosophies. Plato founded the Academy as an intellectual and spiritual community designed to form human beings. For him philosophy was best carried out in a school by a community of life and dialogues among masters and disciples. Other ancient philosophers followed Plato in educating disciples in a community.

While Plato's ultimate goal of education in his Academy was to educate for the transformation of the republic, this was to be achieved through an intellectual and spiritual community in which individuals first of all sought their own self-transformation. Life in the ideal community of the Academy was to inspire disciples to work for creating the ideal city. This philosophical education meant purifying the mind in order to liberate the soul to live the good life. Platonic education consisted first of all of mathematics followed by dialectics. Both of these subjects were viewed as means of self-transcendence. The abstractness of mathematics and the rationality and universality of dialogue enable learners to move beyond ordinary understanding. At times dialogue would lead participants to the very limits of language by revealing to them their inability to express what they experienced in their moral and spiritual existence. Knowledge gathered through dialogue was not merely theoretical but a virtuous transformation of persons. Whitehead has noted that 'the idea of pure

knowledge, or of pure understanding was completely foreign to Plato's thought. The age of the Professors had not yet come' (in Hadot, 2002, p. 70).

Spiritual exercises in Plato's Academy included the practice of death described in the *Phaedo* and the practice of transcending all mundane matters described in the *Theaetetus*. Plato recommended meditation for controlling desire and anger as well as for remaining calm in times of misfortune. Using the death of Socrates as an example Plato counseled that a person who has spent life philosophising does not fear death because philosophy frees mind from body, controls unruly passions, and enables the soul to soar above mundane matters. For Plato the soul of the philosopher who has elevated thought and contemplated the totality of time and being 'will therefore not look on death as something terrible' (*Republic*, 486 a–b).

What we know about Socrates, Plato's master, we learn mainly from the dialogues of Plato. Socrates has often been compared to Jesus in his life and teachings. Though neither wrote anything and gathered only a small group of disciples, they have had immense influence on generations after them. Like Jesus Socrates was interested in arriving at truth and often used questioning as a method for doing this. Both tried to get people to understand their true selves. Like Jesus Socrates was more interested in what people were than in what they possessed:

I have no concern at all for what most people are concerned with: financial affairs, administration of property, appointments to generalships, oratorical triumphs in public, magistracies, coalitions, political factions. I did not take this path...but rather the one where I could do the most good to each one of you in particular, by persuading you to be less concerned with what you have than with what you are...so that you may make yourselves as excellent and as rational as possible (*Apologia* in Hadot, 2002, p. 35).

Socrates was interested in values as well as knowledge, in action as well as in thought, in care of the self as well as care of the city. Though Socrates did not start a school of his own like Plato, Aristotle and others, he has over the centuries been the exemplar of what a philosopher should be: one who cares deeply for the souls of others. He has provided a description of philosophy that runs through ancient philosophy, a manner of being, communicated through dialogue. In the *Apologia*, he stated that

It does not seem human for me to have neglected all my own affairs and to have kept neglecting my own affairs for so many years now, and always to concern myself with your interests, giving up to each one of you individually like a father or an elder brother and persuading you to care for virtue (in Hadot, 2002, p. 38).

At first sight it does not appear that Aristotle's Lyceum meets all the requirements of a school of philosophy that intends to educate disciples into a philosophic way of life, emphasising as Aristotle did intellectual powers and pursuits. Yet it seems clear that Aristotle is also interested in philosophy as a form of self-transformation, which

he calls *theoria* or contemplation. *Theoria* is a god-like goal to be achieved through intellectual pursuits in the context of a community in which this ideal is lived out as fully as possible. In contrast to Plato's rational dialectics, Aristotle's program of research and studies emphasised empirical investigations through which one ultimately reaches the divine, which is the cause of earthly phenomena. It is through this contemplation that disciples are transformed, though Aristotle admits that our efforts are often more a searching than attaining the final goal of contemplative happiness. One does not find in Aristotle's Lyceum the spiritual exercises present in other schools unless study, investigation, and contemplation satisfied the spiritual quest of students, as they probably did. Also, political education does not play the same role in the Lyceum as it did in Plato's Academy. Aristotle directed his political treatises at citizens and leaders, for he believed that it was the task of politicians to provide the situation in which citizens can learn. For Aristotle philosophers were to influence life in the city by teaching politicians rather than through becoming rulers themselves, as Plato advocated. For Aristotle the ultimate goal of life was to live the life of the gods by striving for happiness, to be achieved through the contemplative or philosophic life. The life of the mind is an end in itself to be sought and loved for itself and not for utilitarian purposes. John Dewey in his *Democracy and education* criticised this approach to education as elitist.

By the end of the fourth century B.C. there were four schools in Athens. Besides Plato's Academy and Aristotle's Lyceum there was also the school of the Stoics who met on a *stoa* or porch, and the school of the Epicureanism, named after Epicurus, which met in a garden. These schools lasted for about three centuries. Stoicism became a powerful philosophy in the Roman Empire and was embraced by Marcus Aurelius, Seneca, and Cicero. The Stoics and the Epicureans joined the earlier philosophers in establishing schools as communities in which disciples shared a way of life for attaining shared spiritual goals. The theories of these school supported spiritual transformation of disciples, since like the earlier schools, these schools had goals of self-transformation. For the Epicureans the goal was a life of stable pleasure achieved by limiting one's appetites while for the Stoics the goal was a life of self-coherence. Each school had its own spiritual exercises for guiding disciples in reaching these goals. The priority in these schools, as in the Academy and Lyceum, was a commitment to a certain kind of wisdom or way of life.

The four schools were basically similar in their teaching methods, using some form of the Socratic method. Life in the city demanded mastery of speech through rhetoric, dialectics and dialogue. Questions were asked such as 'Is death an evil? Is pleasure the supreme good?' While in the early period the dialogue was an end in itself, as we learn from the Platonic dialogues, in the later period the master made dogmatic comments on the question or thesis. Alexander of Aphrodisias noted

This form of discourse (discussion of questions) was customary among the ancients, and this was how they gave most of their classes: not by commenting on books, as is done now (at that time, there were no books of any kind), but

by arguing for or against a thesis once it was proposed, in order to exercise their faculty of inventing arguments, basing themselves in premises admitted by everyone (in Hadot, 2002, p. 104).

Cicero added a note of realism when he complained that for him Stoic teaching at times reduced the student to giving yes-or-no answers and thus students 'are not transformed in their soul and go away as they had come. For although the thoughts which the Stoics express may be true and sublime, they do not treat them as they should, but do so in a rather dry manner' (*On the ends of good and evil*, IV, 3, 7).

The Epicurean approach to education was more deductive in that it started out with principles and not questions. Disciples were to memorise very brief sayings and eventually compile a list of chief beliefs, armed with which they could approach the more advanced books of Epicurean writers. Eventually Stoic philosophers also presented their teachings in a rigorously systematic and logical order. These sayings were thought to produce an effect on the souls of the listeners or readers. Such teachings were to lead to vital choices by the learners. Discussions were always included in this mode of learning. It should be noted that while only the elite attended the schools of Plato and Aristotle the schools of Stoics and Epicureans were open to all, rich and poor, male and female, free citizens and slaves. The concept of philosophy was thus popularised since 'whoever adopted the Epicurean or Stoic way of life and put it into practice would be considered a philosopher, even if he or she did not develop a philosophical discourse, either written or oral' (Hadot, 2002, p. 108).

At the heart of Epicureanism was a way of life that dealt with pleasure and pain. The Epicurean task was to deliver persons from suffering and allow them to experience pleasure in a reasonable way, seeking the pure pleasure of existence. The Epicurean philosopher tended to the sickness of the soul. People were taught to control suffering and attain pleasure by moderating their desire for wealth, luxury, and power. The ascetic life consisted in suppressing desires that are neither natural nor necessary, limiting pleasures that are natural but not necessary, and avoiding pleasures that are neither natural nor necessary. Part of Epicurean teaching was removing fear of gods and death; the gods are not concerned with life on earth; since there is no life after death there is nothing to fear.

The spiritual exercises of Epicureans included meditation both by oneself and with companions, and recognising that death is actually nothing for us. Disciples were also to exercise the discipline of desire, being satisfied with simple foods and clothes, renouncing wealth and honors. The Epicurean philosopher was like a spiritual director who guided people through the sufferings and pleasures of life. For the Epicureans the supreme pleasure was contemplating the infinity of the universe and the majesty of the deity. Other pleasures included discussion, friendship, and life in common, including both slaves and women. Meditation on death was extremely important since many viewed it as the ultimate suffering. Epicurus recommended: 'Persuade yourself that each new day that dawns will be your last; then you will receive each unexpected hour with gratitude. Recognise

the value of each moment of time which is added on as if it were happening by an incredible stroke of luck' (in Hadot, 2002, p. 126).

Zeno, the founder of the Stoic school was praised for the education he gave to young people, the remarkable life he led, as well as the harmony between his life and his teachings. Stoic schools in Greece were very influential in educating ordinary citizens and leaders. As noted earlier, prominent Romans who studied in Athens, developed Stoic philosophy and embraced the Stoic way of life.

Stoics believed that the only evil in the world is moral evil and that there is no good but moral good, which they called duty or virtue. The existential choice to be made by Stoics was not for pleasure but for the demands of the good, which are known by reason and which transcend the individual. Humans exist in a tragic situation which is determined by fate, that is by forces outside ourselves that we cannot change. Though we cannot change things, with our freedom and reason we can change our attitude towards them and thus achieve peace, happiness and coherence. Through our moral intention we can give meaning to events. To overcome the unhappiness that this situation brings one must live and act in accordance with reason. In living this way we can find freedom, independence and coherence within ourselves. This is Stoic advice for living: 'Do not try to make things happen the way you want, but want what happens to happen the way it happens, and you will be happy' (in Hadot, 2002, p. 133).

In ethics the Stoics emphasised duties or appropriate actions which depend partly on us and partly on fate. This is the only way we can deal with the uncertainty of daily life, living under reserve, that is if Fate permits. Since we cannot be absolutely certain we are doing the right thing, what counts in the end is the intention of doing good. This, however, should be no deterrent to participation in a disinterested manner in social and political life for service of the human community. The Roman Seneca explained that:

No school has more goodness and gentleness; none has more love for mankind or is more devoted to the common good. The goal it assigns for us is to be useful, to help others, and to take care not only of ourselves but of everyone in general and of each person in particular (*On clemency*, II, 3, 3).

The spiritual exercises of the Stoics are not as well known as those of the Epicureans since fewer of their early writings are available to us. The practice of logic as applied to everyday life was an important exercise. Contemplation of the essence of objects was another practice. Stoics were to recognise themselves as part of the Whole by elevating themselves to cosmic consciousness through meditation. They were also to recognise that all things are in a process of change. Meditation on death focuses on it as a fundamental law of universal order. Stoics were also to practice 'pre-exercise' or 'pre-meditation' of evils that we anticipate we might have to bear. This was to be done not only to prepare us to face these realities but also to bring us into contact with cosmic reality. Meditating on death makes us face each moment and each action as if it were the last. Thus for Stoics philosophy is a practice that entails a fundamental attitude towards all aspects of life. One's theory

of the universe has bearing on all of one's actions. To live philosophically is to live in union with nature and reason and in accordance with Fate.

Some changes took place in philosophy during the years of the Roman Empire. Platonism became the dominant philosophy of late antiquity with the decline of Epicureanism and Stoicism. Pedagogy also changed in that philosophy was then taught through reading and explanation of the texts of the school's founders. Teachers also wrote commentaries on these texts to help the students learn. Texts were taught in an order that would promote students' spiritual development. Students first studied the ethical texts of Plato, which would promote their purification. They then studied texts dealing with the physical world in order to learn to transcend the limitations of this world. Lastly, they studied metaphysical or theological texts in order to ascend to the contemplation of God. Reading these texts was considered a spiritual exercise 'because the reading of each philosophical text was supposed to produce a transformation in the person reading or listening to the commentary' (Hadot, 2002, p. 155). Teachers of philosophy thus became directors of conscience who cared for the spiritual development of their students. The final goal of Stoic education was developing closeness and union with the supreme deity.

The tradition of philosophy as a way of life is no longer a major orientation in philosophy though it has reappeared in the history of philosophy in some of the writings of Erasmus, Montaigne, and Descartes. It would appear that since the early medieval period religions took over this task of conveying a way of life. Christianity adopted many of the emphases of ancient philosophy as one sees especially in monastic culture (LeClerq, 1959). Philosophy went its own way to emphasise rational analysis, beginning with the scholasticism of the medieval universities. Philosophy increasingly focused on the intellectual life and ignored the practical life, the life of experience. To remedy this situation a new journal had to be started dedicated to philosophy and public affairs. Today we have arrived at the point where many tensions exist between religion and philosophy. Religion is a matter of faith and philosophy is a matter of reason. Some philosophers have manifested an opposition to religion while some forms of religion consider philosophy harmful to religious faith.

Religious Education and Philosophy as a Way of Life

Education, especially religious education, has been caught in these tensions between philosophy and religion. This is especially true with regard to philosophy of religious education. Religion is about fostering a way of life. For the most part modern philosophies have abandoned this task and now emphasise rational analysis, language and textual analysis, intellectual understanding, argumentation, and proofs. The risk with modern philosophy is that it might be so concerned with texts that it does not get to explaining what the texts mean for life. The same can happen with religion, even though the philosophical approach in religion and education have added to our understanding of these enterprises. However, there is a danger that

those who teach religion may embrace these useful methods and forget that these methods are secondary to the primary purpose of religious education: to convey and confirm people in a way of life. A reflection upon ancient philosophy may provide a helpful way of reinforcing this primary focus of religious education. I will draw some conclusions for the theory and practice of religious education from this short survey of ancient philosophy. These are well known truths and for that reason cannot be brought to the fore too often.

The Value of Philosophy

I have always felt that philosophy is a valuable resource for religious education, notwithstanding the tensions that exist between religion and philosophy. Ancient philosophy is especially close to both religion and education. Both philosophy and religion ask the basic questions about human existence. Although some philosophies are inimical to religious faith, this need not be the case. Philosophy need not undermine religious faith, as this study of ancient philosophy has shown.

The value of philosophy for religious faith can be shown by examining carefully the most famous philosophical imperative. Even those outside the sphere of philosophy know the imperative of Socrates: 'Know thyself.' This expression is usually taken to highlight the importance of self-examination and self-knowledge. Yet the version of this imperative found in Plato's *Charmides* takes a slightly different form, it states: Know thyself, *mortal* (emphasis added). The meaning here is, according to Claire Elise Katz (2004), is an imperative to know one's boundaries and limitations. This clearly gives a religious and moral meaning to the expression, a pointed warning against pride and arrogance, what the Greeks called *hubris*, a fatal flaw for many humans that may lead to their undoing and even destruction.

Ancient philosophy, in fact all true philosophy, is not just about reading prescribed texts; it is about reading the texts of our lives in the light of the philosophical texts. There is a tendency in both philosophy and religion to centre exclusively on the text and not to examine what the text means for daily life. Ancient philosophy tried in a valiant manner to give proper emphasis on the meaning of the text and its meaning for human lives.

Religion as a Way of Life

The religions of the world have as their fundamental task to present before their adherents a way of life, not dogmas to be believed or rituals to be performed. The prophets of all religions inveighed against both dogmatism and ritualism. The Torah, Gospels, Koran and other religious literature summon believers to commit themselves to a certain way of living which is spelled out in this literature. This way of life often consists of following or imitating the life of the founder or other

important personages in the religious tradition. For sure religion can be studied in an academic manner and many benefits have come from this study. Yet there is a danger that those who are involved in this type of study may slight the more essential focus on religion as a way of life. Certainly religion can be studied by those who neither profess or accept its teachings nor participate in its rituals. There is a legitimate and beneficial place for the scientific study of religion. But the nature of religion as a way of life should not be lost upon those who teach it in a context of belief.

I have recognised during my many years of teaching religion in different situations that the context often dictates the stance that one takes towards the manner in which I teach religion. It is easier to approach religion as a way of life in the context of the home, church, and community than it is in the context of the school. Adults and children are more open to this approach than are young people who may be experiencing some difficulties in adhering to the beliefs into which they have been socialised or which they have been taught. Yet even in the context of teaching religion in classroom settings teachers need to be open to those moments when the text beckons to go beyond the level of instruction.

Orthopraxis as More Important than Orthodoxy

One of the fundamental tenets of theologies of liberation is the primacy of orthopraxis (right doing) over orthodoxy (right belief). While not denying or minimising the importance of beliefs and their effects upon our actions, the primacy of right actions should be maintained in teaching religion. Religions that place stress on creeds, dogmas, and other forms of authoritative teachings run the greater risk of reducing religion and the teaching of religion to a system of beliefs to be analysed and argued over. This repeats what happened in the later days of ancient philosophy when the study of the texts usurped the attention that should have been given to putting the philosophy into practice.

The Intimate Connection Between Beliefs and Life

Years ago as seminary student my friends and I noticed the lack of connection between our studies and our lives. Courses in theology, scripture, history, and law were taught without any explicit connections made to the life of faith. Our spiritual lives were to be tended to by one spiritual director who gave a talk each week, we could also speak to him privately, and we engaged in many spiritual exercises. However, no connection was ever made that I remember in the hundreds of hours in seminary classes to our religious and spiritual lives.

I think that this is also a danger when religion is taught in a school setting. Classes in religion and theology deal with our understanding of the faith while

campus or youth ministry attends to the life of faith. Perhaps this is what we can expect when religion becomes an academic subject.

The Value of Learning in Community

Being a philosopher in ancient times meant belonging to a community of learners, being in a relationship not only with a master but also with fellow learners. Philosophy was not a solitary, ivory tower enterprise as it is with many modern day philosophers and academics. Becoming a philosopher was not a matter of attending courses and receiving a certain number of credits. It was entering a way of life. This is also the best context for religious education. Of course, there is value in individual study, reflection and contemplation. But the value of a supportive, challenging community is manifest in sustaining purpose, providing role models, handling one's difficulties. When I think of the most effective religious education experiences in my life I think of homes in which we shared faith in our Lenten journeys, the meeting of Christian families, a weekend of education with Christian and Jewish educators, interactive retreats, study groups, conventions of scholars. The value of learning in a community is succinctly attested to in the rabbinic dictum: 'Much have I learned from my masters, more from my colleagues, but from my disciples most of all' (Crenshaw, 1998, p. 175).

Conclusion

This paper has provided an opportunity to review recent writings in the field of philosophy of religious education, as well as my own involvement for many years in this field. Many professional religious educators as well as practitioners come to their work with philosophical or theoretical positions. Professionals have made these explicit in their writings. Many approaches to philosophy can be found in these writings, each of which brings to the foreground some important dimensions of religious education.

In this paper I have reflected on this field of study by looking back at the beginnings of Western philosophy, with the approaches of Greek philosophers. Inspired by the work of Pierre Hadot this paper looks at these philosophers as presenting philosophy not primarily as a search for a meaningful world but rather as a search for a meaningful spiritual life. This approach to philosophy has not been a prevalent one among modern philosophers. But it is valuable for religious educators since it goes to the very heart of the enterprise, educating persons to be religious and spiritual in a particular way of life.

That such an education is basic and essential to human society is clear from a study of education in Judaism, one of the oldest world religions. The aim of this education was the formation of character through inculcating the virtues of self-control, restraint, eloquence, and honesty. These virtues were buttressed by religious faith and fear of the Lord. Religious educators are well reminded that

ancient wisdom in both Judaism and the Greek world connected education with the desire for order and continuity. In ancient times:

to combat the powerful and seductive lure of chaos in various forms, societal or personal, older and more experienced individuals tried their best to prevent the younger generation from falling into the pitfalls confronting them in the nooks and crannies of daily life (Crenshaw, 1998, p. 1).

CHRISTIAN EDUCATION AND THE RECONSTRUCTION OF CHRISTIAN FAITH

John M. Hull

The Queen's Foundation for Ecumenical Theological Education

Introduction

The history of Christianity presents certain problems to the Christian educator. The self-understanding of faith has passed through many revisions and development is particularly rapid during the present period of religious and economic globalisation. Christian consciousness carries forward the impressions left by earlier experiences, and the natural tendency to conserve tends to retard recognition of these impressions, making it difficult for religion to fulfil its responsibilities toward the contemporary world.

A major impression upon Christian faith has been left by 1700 years of residence within the political power, first of the Roman empire and then of successive European Christian empires. Since the modern missionary movement took place during the period of European and American ascendancy, those forms of Christian faith received by the evangelised countries carry the marks of this geo-political context. The task of disentangling Christian faith, which comes to modern people with these many layers of earlier interpretations, is complex, and demands criteria both historical, theological and ethical. The one who attempts such disentanglement also stands in a certain socio-political reality, and has to grapple with both conscious and unconscious vested interest. This demands a sophisticated theological approach to both false consciousness as a collective phenomenon and self-deception as a feature of individual life. Nevertheless, the legacy of faith and the suffering of the present world insist that the Christian educator make an effort in this direction. There is no pure essence of Christian faith. There is no simple, unmediated approach to the Bible. Naïvety only succeeds in landing us in a morass of unsuspected depths and leaves Christian faith without defence and without the analytic energy to tackle the problems of life and death today.

The present essay attempts to grasp this nettle through a combination of theological assertion and historical interpretation, commencing with a series of theological fundamentals springing from faith in God as the living God of Christian tradition.

Basic Orientations

The church is an instrument of Christian faith (Eph 3:10). The church is also part of Christian faith, since faith in the one, holy catholic and apostolic church is affirmed in the ancient creeds. However, when we are considering the role and prospects of a particular denomination, it is important to emphasise that the church as a whole (and therefore the particular, historic denominations as well) does not live unto itself but is an instrument to further the mission of Christian faith in the world (2 Cor 4:5). No specific denomination is essential to this task, and Christian faith will generate new movements from time to time to become new instruments of its own mission.

Christian faith is an instrument of the mission of God (Eph 3:9). It is not the only such instrument. In spite of its unique characteristics and value, Christian faith does not live to and for itself, but is to be judged by its faithfulness to the mission of God (Rom 11:21).

The mission of God is a mission of life for all human beings and for the whole creation (Gen 2:9; Deut 30:15; Ps 36:9; 103:4; John 1:4; 10:10; Tit 1:2). In scripture God is shown to be opposed to every force and structure which frustrates life (Ex 2:23–5; Rom 1:18; James 4:6). God is energetic in the pursuit of justice (Ps 9:8; Is 11:4; Luke 1:52–3). God tears down the oppression, exploitation, greed and pride which oppose the fulfilment of God's mission (Amos 5:21–4; Luke 11:20–2).

The special characteristic of the mission of God which found expression through Jesus was the inauguration of a community of inclusive love (Matt 5:43–4; Luke 7:36–50; John 13:34). Jesus declared that the mission of God was to establish the rule of God in his words and actions (Mark 1:14–5; Luke 11:20). As prophet (Matt 13:57), teacher (John 3:2) and Son of God (John 1:49) he opposed the social and physical distortions which were obstructing the appearance of the new community (Luke 6:6–10; 13:10–16). Faithful to the end, he sealed his witness with his blood (Mark 12:1–8; 14:24; Heb 13:20). The church flows from the life of Jesus (Acts 20:28; Rom 5:10), a life laid down and restored (John 10:15–17), and through the church the risen Christ continues his mission (Matt 28:20; John 15:1–2). The mission of the church is thus the same, by continuation, as that of Jesus Christ (Matt 16:18; John 20:21; 2 Cor 4:10), and the mission of Jesus is identical with, but not the only form (Amos 9:7; Mal 1:11; Acts 10:35) (Falk, 1985), of the mission of God (Matt 11:27; John 1:18).

In reflecting upon the God who is the ground and source of mission, the followers of Jesus affirmed faith in God as the one who sends the mission (Matt 10:40; Acts 10:38), faith in Jesus as the one who was sent (John 5:36), and faith in the

Holy Spirit who is the loving energy of the sending (Acts 2:33; 19:2–6). In this Trinitarian faith in the sender, the sent and the sending the church finds the ground of its hope (Matt 28:19–20; Rom 8:16–17). This hope is made actual insofar as the disciples of Jesus, formed into the church by the Holy Spirit (Rom 5:5), are becoming the symbol of the community of inclusive love, and thus remain faithful to the mission of the triune God (Eph 2:18).

The Mission in History

God acts through creating creativity (Hartshorne, 1967, p. 26). The world that God created is not a static reality, emerging complete and entire. Rather, it is a dynamic, evolving world which carries the stamp of its originator in its endless innovation, novelty and change. Thus the mission of God in promoting life must be mediated through the dynamics, structures and vicissitudes of life itself (Tillich, 1953, p. 162). By the same token, the meaning of the mission will be interpreted by human beings (1 Cor 13:12; 2 Cor 4:7), who are both the objects and the agents of the mission. This meaning will be distorted, misunderstood and contradicted. It will also be accepted, transformed and transforming.

The fulfilment of God's mission will be a renewed creation, when the liberty of the children of God will reach its glorious realisation, along with the renewal of the created order (Rom 8:21). This lies in the future. The God who originated the mission from the past is also the God who calls from the future (John 14:18; Rev 1:8).

Since the mission is a proclamation and a demand for justice it will be countered and opposed by injustice. The mission to actualise a community of universal love will be opposed by sectional interests and tribal loyalties (Erikson, 1975, pp. 176–179; 1982, p. 95). The mission to establish a community of inclusive love will be opposed by selection, hierarchy, the setting of boundaries and limits, the distinction between us and them (Nipkow, 2003, p. 193). The forces of opposition to God's mission are also dynamic, proactive, intelligent, forcing acceptance of their own will rather than the will of God (Rom 7:21–3; Eph 6:12), seeking life for themselves rather than life for all, building up structures, concentrated centres of hostility and opposition (Hinkelammert, 1986, pp. 125–126) just as the mission of God builds up structures and powers of the life of love.

The prophetic and apostolic mission of the church, the incarnated mission, will be subject to ambiguity and compromise (Hinkelammert, 1986, pp. 240–241). It will tend to be understood from the position in the life cycle (Fowler, 1981; Oser & Gmünder, 1991) and the place within the power structure (Metz, 1981; Hull, 1992) inhabited by those who seek to promote it. Moreover, those who benefit from the injustice in the world will not read the mission in the same way as those who suffer from the injustice (Lamb, 1982; Schüttke-Scherle, 1989). The meaning of the mission, which is the meaning of Christian faith and the nature of the church, has become part of social memory. It has passed through the distortions and deceptions which are typical of the way that societies remember (Connerton, 1989; Halbwachs,

1992; Werbner, 1998). Each national or linguistic or ethnic group that comes into contact with the mission will understand it experientially within the confines of its own historical and geo-political setting. In so far as the mission is made articulate in language and speech it will express the vested interests, the grammatical aggression by means of which each language subdues meaninglessness in the interests of those who are structured by that language (Foucault, 1972; Pêcheux, 1982; Derrida, 1998). Religion itself will be found on both sides of the antitheses created by the mission (Baum, 1975). There is no other way for the life of God to communicate with the spontaneous and developing character of created life than through these ambiguities.

The Mission of God and Christian Faith in Europe

Five hundred years of association with the European search for power have led to a huge expansion of Christian influence but have also seriously compromised the Christian tradition insofar as it is a witness to and an agent of the mission of God. Those who inherit the results of these centuries of collaboration and protest tend to understand Christian faith from within this context. The contamination exists both objectively in that it has taken place, and subjectively in the mental and spiritual lives of those who are its products (Comaroff & Comaroff, 1991; 1992). Those who have been shaped by the European tradition of Christian faith find it hard to recognise its distorted character. This would mean perceiving distortion within themselves, and that implies some contrast or antithesis which would render the distortion visible.

Moreover, the process is itself highly ambiguous. As this ambiguity is realised, attitudes towards it are necessarily ambivalent. We do not know what would have become of Britain (to take an example of one significant European country) within the context of aggressive international competition if the theology of God's special covenant with Britain had not given the peoples of these Western European islands a sense of identity, confidence and purpose in the world (Drinnon, 1980; Hughes and Allen, 1988). If Britain had not received its vigorous sense of identity and national destiny from Christian faith, perhaps it would have got it somewhere else with profound consequences both for Britain and for Christian faith in Europe and the world.

When we read how Frances Drake and his sailors on their voyage around the world, anchoring off the Pacific coast of North America, went ashore, and going down on their knees sang psalms whilst pointing to the sky in order to evangelise the group of native Californians who met them (Heizer, 1947), we do not know whether to groan with embarrassment at this early example of the arrogance with which Europeans have treated native cultures (Berkhofer, 1965; 1978; Swain and Rose, 1988; Tinker, 1993), or whether to admire the confidence and the courage which drove those isolated men in that tiny vessel across the unknown oceans of the world.

It is not our business to condemn previous generations, but it is our responsibility to understand ourselves in relation to them. The dramatic effects of Britain's

appropriation of Christian tradition in the service of its newly discovered national enterprise demand our attention.

When the colonisation of North America was being undertaken in the early decades of the seventeenth century, the passages of scripture which inspired the colonisers included Genesis 12:1 'Now the Lord said unto Abram, 'Go from your country and your kindred and your father's house to the land that I will show you. I will make of you a great nation, and I will bless you and make your name great' (Symonds, 1609), and Joshua 17:14–18 where the tribes of Joseph complained that too small a portion of land had been given them. Joshua told the tribes to go up into the land, cut down the forests, 'cast out the Canaanites' and possess the land (Gray, 1609). Here we find the seeds of that contempt for the so-called primitive and savage 'red Indians', an image of white supremacy and destiny which is still with us today.

By the end of the French wars of the early eighteenth century, Britain had emerged as a world power with a mission to spread political and economic enlightenment together with Christian civilisation around the globe.

We can trace that mission in the hymns of Isaac Watts (1674–1748), generally recognised as the most significant creator of the English hymn (Hull, 2002a; 2005) in whom the experiential theology of the Puritan tradition became the nationalistic theology of the Protestant empire. In translating the Psalms Watts wanted to address the present day experience of his congregation, including politics.

In Israel stood His ancient throne;
He loved that ancient race
But now he calls the world His own
And heathens taste his grace.
The British Islands are the Lord's,
There Abram's God is known,
While powers and princes,
Shields and swords submit before His throne (Watts, 1719, Psalm 47).

Shine, mighty God, on Britain shine
With beams of heavenly grace
Reveal thy power through all our coasts
And show thy smiling face.
Earth shall obey her maker's will
And yield a full increase;
Our God will crown his chosen isle
With fruitfulness and peace (Watts, 1719, Psalm 67).

The heathens know thy glory Lord,
The wondering nations read thy word,
In Britain is Jehovah known,

Our worship shall no more be paid
 To gods which mortal hands have made;
 Our maker is our God alone (Watts, 1719, Psalm 96).

He sits upon the eternal hills,
 With grace and pardon in his hands
 And sends his covenant with the seals,
 To bless the distant British lands (Watts, 1782, I, no. 52).

Ye British isles who read His love
 In long epistles from above,
 (He hath not sent his sacred word
 To every land) praise ye the Lord! (Watts, 1782, II, no. 53)

This northern isle, our native land,
 lies safe in the Almighty's hand
 Our foes of victory dream in vain,
 And wear the captivating chain.
 He builds and guards the British throne
 And makes it gracious like his own;
 Makes our successive princes kind
 And gives our dangers to the wind (Watts, 1782, II, no. 1).

It is a striking fact that in the approximately six hundred hymns written by Isaac Watts, some twenty of which remain in the repertoire, there is hardly one dealing with the service of the church to the community and the world in any other way other than spiritual and material domination. In these hymns, the congregation has become a world unto itself. Everything is reduced to worship. Indeed, there is nothing but doctrine and worship; the mission has been swallowed up by 'gospel', the repetitive celebration by the local congregation of its own intellectual and emotional life.

Between 1770 and 1850 the nation of commerce, agriculture and industry became the first capitalist country in the world (Macfie, 1967; Viner, 1972; Hirschman, 1977; Smith, 1993; 2002). The power of money, first located in the north Italian cities in the thirteenth and fourteenth centuries, moving to Portugal and Spain in the fifteenth and sixteenth centuries, and to the Netherlands in the seventeenth century, now made its temporary home in London (Arrighi, 1994). These years have been called 'the age of atonement', because not only was there an emphasis upon responsibility for one's debts and the need to repay them, and so atone for one's financial mismanagement, but this was mirrored in a theology of the cross which

interpreted the death of Christ as God's punishment for human sin, diverted away from the debtors themselves and inflicted upon the head of the innocent Jesus, thus maintaining confidence in the stability of the moral economy of the world (Hilton, 1988; Selby, 1997).

From approximately 1870 to 1914 the pound sterling ruled the world, and the British theology reached its climax. In the Victorian and Edwardian hymns we find the principal statements and popularisations of this theology. The military metaphors, often taken all too literally, the sense of weariness in the face of a surrounding world of evil, the concentration upon the glories of heaven, and the nostalgic recreation of a pastoral life, are the typical emphases which emerged (Tamke, 1978; Adey, 1988; Wolffe, 1997).

The Present Situation: First Phase

This is the tradition of Christian faith which congregations and local churches in areas influenced by Europe have inherited. For more than four centuries, this theology was functioning. We may deplore it or we may admire it, but this theology did something. It gave a sense of identity, confidence and purpose (Wolffe, 1994). Moreover, it played an important part in establishing Christian faith in almost every nation on earth (Stanley, 1990). We may sometimes be embarrassed about how this took place, but without it Christian faith would not now be in such an advantageous position to influence the history of the world.

However, this faith is no longer functional. The theology of the empire has outlived the empire. The empire has gone but the theology lingers on. Much of the modern church is like the Israelites, going into exile with a royal kingdom theology. Faith has become a remnant, far from the glories of its greatest achievements. How can the Lord's song be sung in a strange land? How can the imperial theology still be proclaimed in a post-imperial age? However, before describing in further detail the characteristics of the religious situation today we must examine in greater detail the content of this received power—theology. In doing so, we shall notice that it is not a recent development. Christian faith has been the partner of imperial power ever since the conversion of Constantine and the adoption of Christian faith as the official religion of the Roman Empire (Kee, 1982). The developments in Britain would not have been possible without a thousand years of preparation. Moreover, since this theology in the form we have received it was shaped by Britain's aspirations and Britain's place in the world, and since those aspirations were shared by other European nations who sometimes had a similar place in the world, or wished to have one (Christensen & Hutchison, 1982), or were influenced by those who did so, the British theology has many links and parallels with theological developments in other European countries. Since Europeans exported this collaborative faith in the hey-day of European power, from approximately 1800 to 1939, it is not surprising that Christians nurtured in the non-European world often bring back to Europe the faith which Europe had a century ago.

The principal features of this imperial faith as it is received today are as follows:

1. *The doctrine of sin*: Sin is driven out of the actual, material world into pre-historical origins, provided with a sexual or mystical transmission and a post-mundane judgement.
2. *God*: The forward dynamic of Christian faith is denied as the God in front of us becomes the God above us. Metaphysics and its accompanying hierarchy takes the place of apocalyptic with its hope of transformation (Bloch, 1972; 1986).
3. *Jesus Christ*: The teaching of Jesus is reduced to a comma in the Apostles' Creed. As with the doctrine of sin, so with the person and work of Jesus, everything has become either beginning (the Nativity), ending (the Crucifixion and Resurrection) or future (the Second Coming and the Last Judgement), but rarely focuses upon the words and deeds of Jesus. In some traditions, there is a kind of concentration upon Jesus which is almost unhealthy. Jesus is no longer conceived of within the Holy Trinity but in a sort of isolation. When Christian faith interpreted Jesus as the second person of the Trinity, the effect was to relativise Jesus, to regard him as relative to the Father and the Spirit, and so to emphasise the place of Jesus Christ in the mission of the whole godhead. When this is forgotten, it becomes easier to adore Jesus in a kind of erotic manner than to obey him. We gaze upon him but rarely follow after him. The Christian mission has been turned into a personality cult of Jesus.
4. *Salvation*: Salvation is conceived of in spiritual and eternal terms. It is realised in heaven or lost in hell. Salvation is individualised and interiorised.
5. *The Church*: The centre of the life of the church has become worship. Because of the church's concentration upon its own life, and its isolation from the mission of God which called it into being, church itself becomes a fetish. The theology of justice and peace is replaced by an orifice theology concerned with what comes in or out of the bodily orifices (Douglas, 1996): sex, speech and sacraments. As the Eucharist becomes intrinsic rather than instrumental, church life becomes trivialised.
6. *The Christian Life*: The Christian faith is conceived of in terms of truth rather than action within the mission of God, through Jesus. This leads to a preoccupation with words, ideas, revelation and authority. The emotional repertoire of the Christian emphasises guilt for oneself rather than anger on behalf of others, while deportment is characterised by niceness rather than by committed action.
7. *The Bible*: The Bible is read in the light of the above assumptions and may thus become incomprehensible, irrelevant, ritualised and boring.
8. *Christian Education*: The Christian education of children often becomes merely moralistically biblical.
9. *Relations with other Religions*: As the mission of God against injustice and for a universal community of inclusion is increasingly minimised, the consciousness of Christians is nurtured into a competitive relationship with people from other faiths.

The Present Situation: Second Phase

Although the British power theology has lost its old function and remains only in a number of fetishised fragments, the powers opposing the mission of God continue to proliferate and strengthen. The power of money has moved not only from London to New York, but already has passed beyond the control of the world's last remaining independent state (the USA), into a globalised form, where it exercises greater authority than ever before (Wachtel, 1990; Amin, 1997; Martin & Schumann, 1997). A money-curtain has been erected around the rich two-sevenths of the world, and the character of Christian tradition continues to evolve within the perspectives of reality which life within this enclosure creates. Money is worshipped as God, and God is worshipped as money (Hull, 1996a; 1997). The most energetic forms of the new power-and-money theology may be found in the United States, which as the most powerful nation in the world today, is able to offer the context within which this sort of theology can still function (Stoll, 1982; Diamond, 1989; Barkun, 1994). The contrast between the relative vigour of Christian faith in the United States and the languid, nostalgic, exhausted form which it often takes in Britain is to be accounted for in terms of the different positions in the history of global economics occupied by these two nations.

We now see that the residue of the British imperial theology begins to take on a new function, which is mainly unconscious. Since the fragments masquerade as genuine Christian faith, and are taken to be so by many British Christians, the mask of British theology now functions at least sometimes and to some extent as a protection against facing the reality of genuine encounter with the mission of God and its implications. This is actually a less healthy situation than the previous one. The relationship between the imperial theology and the place of Britain in the nineteenth century world was positive—the two realities, faith and world, were mutually supportive and this mutuality was consciously realised and spoken about.

Today, however, Christian faith as the remnant of a past reality has a negative relationship towards the modern world of capital and power. Rather than supporting the church and the Gospel in pursuing the mission of God, the theological fragments act as a kind of collective anaesthesia, existing in a dream-like state of nostalgic self-deception. It functions in the service of the money-God to obstruct and prevent Christian faith from re-claiming its calling to serve the mission of God. It is because of this negative, substitutionary dream-like quality that contemporary Christian faith in Britain tends to become a fetish, whereas the genuinely functioning, living, imperial theology of a century ago was not a fetish but an ideology.

The Theology of Resistance

Did no one challenge the growth of the collaboration between the Christian faith in Britain and Britain's search for powerful identity? Yes, there were continual protests and challenges. One of the most striking movements of protest took place during the period 1630 to 1662, the period of the first British overseas colonies and

the civil war. The community at Little Gidding, gathered around Nicholas Ferrar (1592–1637) (Williams, 1970), and the leader of the diggers' movement, Gerrard Winstanley (1609?–1660) (Winstanley, 1973; Bradstock, 1997), are two outstanding examples. There are interesting parallels between Winstanley's theology and the Minjung and liberation theologies of South Korea and Latin America today.

The movement initiated by John Wesley in the eighteenth century can be interpreted as a massive popular protest on behalf of the poor and the marginalised, against the power theology which had been re-established early in the eighteenth century, following the upheavals of the previous period. Although the Arminianism of John Wesley was not new, in its context it represented an explosion of energy for the inclusive community of universal love, the pursuit of which is the mission of God.

As one example of the later influence of Methodism as providing a counter-theology, we could consider the Methodist movement for the rights of agricultural labourers in East Anglia between 1872 and 1896 (Scotland, 1981). In their effort to articulate a gospel theology which would empower the labourers in their struggle, the Methodist preachers and organisers used the expression 'temporal salvation' as a limitation and criticism of 'eternal salvation', which was being used to defer the expectations of justice from this world to the next.

The next example of the protest theology of justice and human rights to be mentioned here is that of Bishop Colenso (1814–1883), Bishop of Natal, who became famous for his courageous attempt to bring biblical study into line with nineteenth century developments in the natural and social sciences. Even more significant, however, was his anthropological work, especially his re-statement of the purpose of Christian missions and his struggle on behalf of the rights of the black people of South Africa against the encroaching demands of British power. In spite of the opposition which his ministry aroused from his fellow bishops in Southern Africa and England, John William Colenso may be regarded as a prophetic figure, one of the earliest champions of liberty and a precursor of liberation theology (Morris, 1973; Parsons, 1997).

Next, we must mention the Christian socialist movement associated with the names of Frederick Denison Maurice (1805–1872), Charles Kingsley (1819–1875), John Ruskin (1819–1900) and others. Maurice lost his Chair of Theology in King's College, London, in 1853, because of his refusal to accept the doctrine of eternal punishment in hell, and had a profound impact upon the emergence of a liberating political education for working people (Maurice, 1968).

Finally, mention must be made of the various expressions of the 'everlasting Gospel' of the mission of God in our own century, including the work of Archbishop William Temple (1881–1944) especially his influence upon the creation of the Welfare State (Temple, 1956). We should also consider the many movements for theological reform in recent decades (Ambler, 1980).

Contributions of enormous significance to the revitalisation of Christian faith as an instrument of God's mission are being made today by new theological movements outside Europe: South American liberation theology, South Korean

Minjung theology, Indian Dalit theology, while movements within the European and North American cultural circles such as, black theology and women's theology, are making very important contributions to our general awareness of the inner nature and purpose of the Christian traditions in America and England, so virulent in the one, so decadent in the other.

In spite of their significance as examples of theology outside the European power-tradition, it is not possible to make a simple application of these non-European theologies to the situation in Europe. There is ample scope for renewal in the critical, protesting, prophetic theology which has always lived on in Europe itself. There is a need to develop these resources in order to recover a fresh sense of Christian mission in Britain today.

Characteristics of a Reconstructed Theological Contribution to God's Mission

I will now make some positive suggestions for the reconstruction of the aspects of the imperial theology noted above.

Sin

The traditional doctrine of sin, which concentrates upon the salvation and sanctification of the sinner, should be supported but qualified by a doctrine which places equal emphasis upon the sufferings of those who are the recipients and victims of sin. At present, the Christian approach towards evil in the world is lopsided in favour of forgiveness for the actors, rather than compensation and justice for the victims (Park, 1993).

God

Increasingly God will be found not in the endless discussions about meaning which have characterised Western theological reflection, but through participation and involvement in theological action on behalf of the emerging community of inclusive love. God will become real when the knowledge of God is pursued in the works of justice and peace (Jer 22:14–16).

Jesus Christ

Rather than merely adoring Jesus, Christian education should encourage discipleship of him. The nations are to be instructed in the things that Jesus has taught (Matt 28:20). The principle features of this teaching are the great reversal between the weak and the powerful, the rich and the poor, and the breaking out everywhere of the community of inclusive love. The death of Jesus Christ will be understood as indicating and exemplifying the presence of God amidst human sufferings, and this will move Christian disciples towards the discovery of God in the midst of

those who suffer. Moreover, Jesus died as a faithful witness to what he had taught and done. Thus his death sanctifies all the movements which seek to establish the community of inclusive love, the protest movements against oppression and injustice. Jesus is the archetype, representative and instigator of God's action for deliverance and is thus the founder and finisher of faith (Heb 12:1). Jesus is the crucified people (Song, 1996).

The Holy Trinity

The doctrine of the Holy Trinity will be seen as a witness and a symbol of the unfinished character of the Christian understanding of the community of inclusive love since the full meaning of the Holy Trinity is still veiled in the future. Moreover, the *perichoretic* unity of the three persons will inspire and activate Christians into all forms of social solidarity. The Greek theologians of the fourth century spoke of the Holy Trinity as a *perichoresis*, an ecstatic circular dance. The Holy Trinity will be increasingly understood as the incorporation of human suffering into the divine experience and as thus motivating and justifying a similar involvement on the part of the church. The essential openness of the Holy Trinity, as representing God's self-disclosure in history and for history, will initiate attitudes of openness towards other historical impressions of the Ultimate (Hull, 1995).

Salvation

Salvation as the eternal well-being of the soul or person of the individual, will be modified and enriched by understanding salvation as everything which overcomes the powers which are hostile to the community of inclusive love, and everything which encourages the flourishing of human life and all life in creation (Jantzen, 1998, pp. 156–70).

The Christian Life

Justification by love will modify and enrich a one-sided emphasis upon justification by faith.

The Bible

As the ambiguity of the Bible is increasingly recognised, and its patriarchal assumptions are grappled with, the Bible will come to have a new relevance as conversation rather than as a reification of the Word of God (Pui-Lan, 1995).

Other Religions

Christian faith will be seen increasingly as the partner of God's other saving projects, and the futile and competitive relationships between the world religions, which have characterised centuries of European domination, will come to an end.

The Education of Faith

In seeking to interpret the educational problem in the context of a non-functioning post-imperial theology, which is the implicit collaborator with the forces which oppose the emergence of the community of inclusive love, it may be helpful to model our theory and action upon Sigmund Freud's theory of the interpretation of dreams (Freud, 1991). Freud distinguished the latent dream, the manifest dream and the elaborated dream. The latent dream is the real dream, the dream which expresses the desires which are normally concealed and repressed. We may compare this with Britain's growing desire for identity, security and prosperity in the world, amalgamated with the Christian tradition which thus acts as an expression of it.

Before the latent dream comes into full consciousness, however, the energies that originally concealed and repressed the desires for wealth and fulfilment come into operation again and affect the remembering of the dream. The manifest dream is the result. This is the dream as we remember it upon waking up. The older elements in the dream which served the primordial desires have been censored out, and one only remembers the innocuous fragments. This is what we have left in the Christian religious folk-consciousness of Britain today. We will not be able to understand many contemporary manifestations of Christian consciousness unless we realise that they are to be accounted for as the residual fragments of what was once the latent dream. The censorship is the prophetic resistance to the collaboration between Christian faith and tribal desire, which has never been entirely without a voice. However, those voices of protest and opposition were operating without the assistance of the social sciences. Before Christian theology had received the penetrating illuminations offered by Karl Marx, Friedrich Nietzsche, Sigmund Freud, Ernst Bloch, Paul Ricoeur, Michel Foucault, Jacques Derrida and many others, it was more difficult for Christians (even under the pressures of modernity) to understand, analyse and respond to the driving forces behind and beneath the theological surface of Britain. Their attention was, on the whole, fastened upon the content of faith rather than its processes and its functions.

Finally, the dream that is the product of what Freud called secondary elaboration is the dream as we describe it to others, or perhaps to ourselves. Now the incoherent fragments of the manifest dream are bound together into a more-or-less coherent narrative, the mysterious gaps left by the censorship are smoothed over with little explanatory phrases and the result is a kind of story. This is similar to the systematic theology which attempts to make the residual fragments of the manifest dream seem plausible and coherent. This tends to be found in some kinds of the written theology, the theology of books, rather than the theology of lived experience, which generally remains unsophisticated and fragmentary. For example, if Weber was right about the connection between Calvinism and capitalism (Weber, 2002), the desires for wealth and domination which were amongst the human motivations of capitalism, when supported by Calvinism, would be the latent dream. However, as the unity of the latent dream was disrupted by the challenge of a Christian faith

dedicated to justice, the latent dream was fragmented, driven into the unconscious, and what remained were fragments, the manifest dream of certain aspects of post-imperial Christian consciousness. Finally, these fragments were now synthesised, systematised, fused together again in a coherent narrative which became the dream of secondary elaboration, e.g. the hymns of Isaac Watts or the prosperity gospel of contemporary Christian life in wealthy countries.

Educational practice for the reconstruction of relevant Christian consciousness today must confront the problems of self-deception, both individual and collective. In the short-term, modifying the money-curtain may appear to be contrary to British and European interests. This is only one example of the ways in which moving Britain towards a historic mission on behalf of suffering humanity in order to establish an ecumenical community of justice and reconciliation may be seen to be contrary to British interests. Since it is difficult to combine this insight with one's continued self-respect and moral integrity, the mechanisms of self-deception are in continual use. This is particularly true for people within the Christian tradition, for whom the options of a hardened secularised hedonism or a defiant hypocrisy are not so easily available. Self-deception is one of the ways that communities try to forget, and the church as the custodian of the subversive memory of Jesus (Metz, 1980, pp. 88–99) must always struggle against its own self-deception.

This means that Christian education, whether for ministry or for lay discipleship, must reappraise the history of theology in Europe and North America. This can best be done within the context of the social sciences, for the character of this theological tradition can only be understood in relationship to the geo-political and social/economic situation of Britain, in Europe and the world, and is fundamental to the re-education of faith (Hull, 2002b).

By way of contrast, the emerging non-European theologies should also be studied. These should not be added to the theological curriculum as a special study but should be thoroughly integrated into the study of systematics, biblical and historical theology.

A central place must be given in this reconstruction to the study of sin, qualified and enriched as described above, because this represents the church's struggle to comprehend and oppose the structures of evil. The re-education of faith has been seriously hampered by a deficient doctrine of sin. This action/study will involve evaluation and participant action in the realities of such sin, as expressed through poverty, the oppression of children and women, and racism, both in Britain and abroad.

The hymn books must be purged of the relics of the Victorian theology of power.

Hark how the heavenly anthem drowns
All music but its own.

This represents the British theology of power. The gospel of redeeming love does not drown out all music but its own, since it does not seek to oppress and dominate. The music of God is a receptive, listening harmony, which penetrates and elevates all the music of the world. On the other hand, churches must avoid the dangers

of the Jesus-fetish music as well. Christian education must learn to read the Bible again as representing the cry of the oppressed people, and as God's redemptive action on their behalf.

Finally, the theological re-education of the churches cannot be done through talking, words and study. Only through thoughtful participation in action on behalf of the community of inclusive love will the dreaming theology of the post-imperial church be dissipated.

Conclusions

The Christian tradition in Europe and North America today faces a critical choice. The medieval concept of Christendom was replaced by the modern concept of Christianity. This was an understanding of the Christian tradition as being a systematic structure of belief forming a world religion in competitive relations with other similar religious systems. As such, *Christianity* was para-phenomenal, being the reified expression on the plane of ideas of the emerging global competition between Europe and the rest of the world. The period of *Christianity* is now coming to an end. The future lies with what we might call *Christian-ness* (Panikkar, 1988), a revival of ethical discipleship to Jesus inspired by biblical faith in God as sender, sent and sending, the Triune God in redemptive action on behalf of God's world. However, the passage of *Christianity* into *Christian-ness* is not uncontested. A shrewd and hardened form of *Christianity* is also emerging. This adopts even more competitive and rigid forms of life as its dream-like facade is unmasked. We may describe this as Christian Religionism (Hull, 1996b), and it serves the Money God, just as *Christian-ness* serves the living God.

Is there a future for the church? There will continue to be a future for the church as the instrument of Christian faith as long as the church is true to the Christian faith and Christian faith is faithful to the mission of God. However, one might imagine another future for the church, a future in which it becomes the shrewd and hardened collaborator with the powers of financial oppression. Then the church would no longer be the church.

Acknowledgements

I am grateful to the Alan & Nesta Ferguson Charitable Trust for their generous support and also to the British Academy whose grants SG29978 and SG35222 made possible the research that led to this study and to its final production.

RELIGIOUS EDUCATION AND THE NATION-STATE

Gabriel Moran

Department of Humanities and the Social Sciences, New York University

Introduction

This essay is a reflection on the ambiguous role of the nation-state in its relation to religion. I examine the way in which the nation-state is a protector of religion. I also examine the way in which the nation-state needs to be resisted and criticised by religion. Religious education thus has an important part to play in maintaining a fruitful tension between the nation-state and religion.

Our present system of nation-states is usually traced to the Treaty of Westphalia in 1648. Since then, the nation-state is assumed to be the main agent in the world's politics, economics and social dealings. The twentieth century had opposite movements relative to the nation-state. Some national groups strove to get the privilege, power and security of statehood. At the same time, there have been regular announcements that the nation-state is finished, that it has outlived its usefulness. Is one of these movements completely mistaken? Or is it possible that the nation-state, while destined for eventual retirement, is still important for both good and bad reasons?

The nation-state has had a key role in the articulation of modern ethics. The central problem of ethics is how to unite two outlooks. One outlook is a commitment to family, friends and neighbors. This particularistic view might extend as far as the nation. The other outlook recognises the limitation of all groups, including the nation. It looks to a universal concern with all humanity and the whole earth.

At their best, the major religions of the world embody such a twofold ethics: a passionate attention to the particular concerns of everyday life, and at the same time a recognition that every human being and all of the earth is dependent on the creative power of God. Religion, of course, is not always at its best. When not challenged by disciplined understanding, religious passion is placed at the exclusive service of a small segment of humanity. The love of one's neighbor is interpreted to mean love for one's close kin, and indifference or hatred for everyone else. Religious beliefs too often dichotomise the world into good and evil.

Modern Western Enlightenment began as an attempt to retain the hope of a universal ethic but without the passions and prejudices of religion. The parochialism of Jewish and Christian religions was to be superseded by Platonism and Stoicism. The new sciences would gradually replace religion; the ideal of a single humanity would be the guide of ethics. The individual, cut loose from encumbrances of family, tribe and religion, would exercise rational control of life. When the individual understood what his own good is, he would treat others with fairness and equality. Erasmus, one of the first humanists, already had the idea in the sixteenth century: if the name of country is of such nature to create bonds between those who have a common country, why do not men resolve that the universe should become the country of all (Chapiro, 1950, p. 173).

The contemporary thinker who has most consistently developed this outlook is Peter Singer. He has rigorously applied a utilitarian principle to the world as a whole, overriding all claims of what he calls a partial benevolence (Singer, 2003). The only thing that can justify concern with a family member or a friend is that it makes the world as a whole better off. Where conflict arises between partial and impartial commitments, the former should be jettisoned.

Our sense of moral obligation is thus made dependent on our commitment to humanity, or more exactly, to human beings impartially considered. This account of moral responsibility seems at odds with the way that responsibility originates, namely, as an answer to being personally addressed. A professor of philosophy may view the world as a collection of individuals who are linked as members of the human community. The mother of an infant or a nurse in hospice is not likely to see the world in such impartial terms. *This* infant, *that* patient, *my* beloved become the particular embodiment of all humanity. This experience can be blinding; it can also be profoundly humanising.

Thus, while the world's religions have an argument with nationalism as a tendency to divinise the nation-state, they also have to be skeptical about the collapse of all intermediary structures into mere instruments of a single world community. In the latter case, instead of the nation being divinised, a life or an ideology of unity may claim ultimacy. All of the religions warn that nothing in experience is divine. Every moment and every place can be revelatory of the divine, but none is guaranteed to be so.

Religious education should, therefore, approach the nation-state as something more than a temporary instrument that is blocking human unity, but also as something less than the ultimate arbiter of justice and the seat of ultimate loyalty. A love for one's country is healthy if it grows out of love for one's family and neighboring community, out of respect and appreciation of the physical environment and out of a knowledge of the actual history not just the political myths of the country.

The nation-state protects the rights of religion and the rights of individuals to practice their religion. The nation-state is also a serious competitor with religion for the life and death commitment of a country's citizens. In the latter case, the nation does become a block to seeing the human community as well as the human relation to a creative power in the universe.

Protector of Rights

Despite the nation-state's tendency to divinise itself, it is currently the main protector of rights, including the right to practice one's religion. The weakening of the nation's power is dangerous unless there is a legitimate authority to replace it. The twentieth century failed to develop a better authority pattern than was bequeathed to it by the nineteenth century. It seems safe to say that the twenty-first century will not have such a luxury of time.

What we now have in the United Nations is a fragile symbol of what might be. An old saying at the UN is that when there is a conflict between two small nations, the conflict disappears; when the conflict is between a small nation and a large nation, the small nation disappears; and when the conflict is between two large nations, the UN disappears. The saying may need an addendum today that when the United States has a conflict, the UN either agrees or is declared irrelevant. Nonetheless, with all its limitations, the United Nations has had some success in establishing the idea of an international ethics.

The language of international ethics is 'human rights.' One can easily forget how recent is this language and how much progress has been achieved in a short time. The phrase 'human rights' was practically unheard of in the United States until the presidency of Jimmy Carter in 1976. The discussions of the 1960s were about 'civil rights', an appeal to explicit laws defining specific political rights. The claim of human rights is a far more ambitious undertaking, that is, the claim that all people have rights simply as human beings. The wider a claim is, the deeper has to be its roots. And that is where all talk of human rights is worrisome. The ultimate basis for human rights is unclear, but many of the leading voices in the struggles for human rights consider the issue of a philosophical basis for these rights to be a distraction from the practical problems at hand.

Religion is often thought to be the enemy of human rights. The human rights movement in this respect is similar to the environmental movement. Religion, more specifically, Christianity, hovers over most of the environmental discussion as the presumed supplier of oppressive language and imagery. But a better acquaintance with Christianity, while not letting that religion off the hook, would reveal other possibilities that the environmental movement needs. The environmental movement cannot succeed unless the positive possibilities of Christian, Jewish, Muslim, Buddhist and other religions are part of the movement.

In a similar way, positing human rights either in disregard of or in opposition to religion cannot work. Diane Orentlicher rightly criticises Michael Ignatieff for refusing to consider religion's role in the discussion of human rights. Ignatieff argued that human rights requires staying at the table in order to listen to all parties. But for Ignatieff, only religion seems too far beyond the pale. Orentlicher argues that human rights have to be accepted *within* religious traditions. That does not mean claiming that Christianity or Judaism or Islam invented the idea of human rights, but it does mean acknowledging that human rights and the major religions are compatible (Orentlicher, 2001, pp. 141–158).

My own inclination is to wish to search for the philosophical and religious basis of human rights. I realise that the world cannot wait for a consensus that might take decades to emerge or might never be reached. Politicians, diplomats and lawyers understandably put ultimate questions to the side in working through currently needed agreements. But 'human rights' must be a category that religious education could investigate.

I will make a brief summary of United Nations documents that are related to religion and religious education. This history is inescapably intertwined with the idea of human rights, even though there has been an unwillingness to wrestle with religion's place in the human rights story.

The story is usually begun in 1948 with the Universal Declaration of Human Rights. Eleanor Roosevelt, who had been appointed to head the committee that drafted the declaration, was put there mainly because the project was thought to be innocuous. To the surprise of nearly everyone (perhaps even Roosevelt) the committee produced a document that was debated and ratified without a single negative vote (The Soviet bloc, Saudi Arabia and South Africa abstained). More surprising, the document has continued to gain in importance during the last half century.

The only agreement that was possible at the time was a 'declaration' which is not a legally binding document. The United States Senate would not have approved a binding agreement. The hope was for a legally binding 'covenant' in the future. When the Republicans came into office in 1952 they immediately announced that they would not sign any covenant (Evans, 1998, p. 87). The covenant became two covenants (because of U.S./ Soviet conflict) that emerged in 1966. The United States ratified the International Covenant on Political and Civil Rights in 1992; it has yet to ratify the International Covenant on Economic, Social and Cultural Rights.

The Universal Declaration has very little to say about religion. Some heated controversy over religion occurred in the writing of the document. After one heated exchange between the Lebanese Thomist, Charles Malik, and the Chinese Buddhist, P.C. Chang, Eleanor Roosevelt ruled out discussion of religion in the origin of human rights.

The document's only references to religion are in articles 2, 18, 26 and 29. Article 2 says that rights apply 'without distinction of any kind' including sex, race and religion. Article 18 asserts a right to 'freedom of thought, conscience and religion.' This freedom of religion includes the right to change one's religion and the right to manifest one's religion.

The UN's first step toward seeing that the right to religion is observed was through a 1959 commission. A report was made on a study of 82 countries. The author, Arcot Krishnaswami, struggled with the complexity of a right to manifest one's religion. The right of one group to disseminate its religion can conflict with another group's right to their own opinions and privacy. Article 29 of the UDHR had acknowledged the need for some limitations in the exercise of the right. On one side, the ban in French schools of the scarf worn by Muslim women seems to run counter to the right to express one's religion. In contrast, a recent court ruling in the

United States against a Muslim woman seems justified. She had claimed a religious right not to remove the covering of her face for the photo on her automobile license.

The most important international document barring discrimination against religion is the 1981 declaration on the Elimination of all Forms of Intolerance and Discrimination Based on Religion or Belief. The clumsy name is indicative of the difficulties that existed in reaching any consensus. The Soviets objected that religion did not cover atheism. The face-saving agreement was that the Preface and Article 1 refer to 'whatever belief' (Lerner, 2000, p. 20). This document noted that not all differences are unfairly discriminatory. Religions need leeway in hiring personnel, mandating dress, or organising observances.

Both of the Covenants adopted in 1966 have an interesting reference to 'religious education.' I have not been able to discover how they came to use the term. Article 18 of the Covenant of Political and Civil Rights and Article 13 on the Covenant on Economic, Social and Cultural Rights use identical language: the parents have a right to ensure the religious and moral education of their children in accordance with the parents' convictions. The good news here is the recognition of religious education as a universal right. The drawback is the assumption that religious education is exclusively concerned with parental rights. I would not disparage this parental right. It is indispensable that the parent-not the state- should decide on the child's religious education. But religious education does not cease at age 6 or even age 18. The United Nations itself is enmeshed in a kind of religious education. Until it conceives of religious education as a lifelong and life wide endeavor, it will not be very effective in seeing its own role as mediating religious forces.

One fascinating aspect of this UN affirmation of a parental right to control the religious education of their children is a claim by some Christian groups that their religious rights are being violated by the school's teaching. The most common complaint is that homosexuality is being taught as morally acceptable. The UN text is vulnerable here, having declared that the parent has the right to determine that the child's moral and religious education is in accord with the parents' beliefs. Since the Convention of the Rights of the Child defines a child as anyone below the age of 18 years old, the parents' right would seem to apply to 17 year-olds as well as 7 year-olds.

This parental protest has taken on added fuel with the arrival of the Internet which links groups world wide. Schools understandably can be distressed by the attack of these religious groups. Nonetheless, it is amazing to have right-wing groups citing UN documents to defend their rights. That step could lead to the discussion of other rights in other contexts.

One final document I note is a 1998 UN report by Abdelfattah Amor. It is a survey of 77 states on the problem of compulsory religious instruction. Most states still seem oblivious of the rights of religious minorities. Students are not given alternatives to that of instruction in the religion of the majority. There is very little teaching of what the report calls 'comparative religion.' Education is needed, Amor notes, for the development of a culture of tolerance. But religious education that is unaware of the students' diversity of religion can be oppressive and intolerant.

Religion as a Challenge to the Nation-State

The second part of this essay is a near reversal of perspective. From looking at the nation-state as protector of the right to religion and religious education, I now look at the need for religious education to be critical of the nation-state. That suggestion may seem to be one of biting the hand that protects you. However, criticism is not rejection or condemnation. Religious education has to aim its criticism at specific policies of the nation-state. Patriotism can be a virtue if it is truly a love of the *patria*, the people and the land that have nourished a person. But what is called patriotism is often a manipulated endorsement of the nation-state in its entirety. Unbridled nationalism rather than the nation is what lays claim to a religious commitment.

No religion totally identifies with a nation-state. At least theoretically, every religious community keeps some distance from national policies and is willing to protest against policies seen to be evil. Christianity has a complicated history on this point. Its early history is marked by heroic stories of Christians willing to die in defiance of empire. Then for a millenium the Christian church (Eastern and Western) tried to work in tandem with the ruling secular power. The critical voice was often muffled. The Protestant Reformation sparked a return to a biblically based prophetic criticism. But it did not resolve the problem of the relation of Christian churches to the nation-state.

A state often had an 'established' church which did not leave much room either for other Christian churches or other religions. It was also not the healthiest condition for the established religion. There was little room for a religious education that was other than indoctrination into the religion of the majority. The 1998 Amor Report, as noted above, seems to show that religious education still means just that in most of the world.

The Jewish history on this point is simpler than that of Christianity but more tragic. Living in diaspora for two thousand years, Jews were not tempted to wield state power against their enemies. They survived by creating enclaves of Jewish life and practice. In modern times, however, they have shared both some of the possibilities and some of the temptations that Christians have had. They identified with the secular culture of European nations. Many Jews of the nineteenth century were proud to be German Jews, not only accepting of but leading the way in German culture and philosophy. That fact was what made the Holocaust so shocking; the slaughter was not by barbarian invaders but by the nation-state that Jews had experienced as their own.

In recent history, the two main alternatives for Jews have been the United States of America and Israel, each providing an experience of freedom but fraught with new problems. One of the great glories of the United States is that it provided a home for Jews. Among most of the immigrant groups that came to the United States, only about half of the group stayed, the rest went back home. In contrast, nearly all the Jews stayed. They saw the possibilities in the United States and in general they made good use of those resources to prosper. They did not get the power of political office in the United States but they used the educational system to become physicians, lawyers, professors and other professionals. The danger has

been in too closely identifying Jewish life with the freedom offered by the secular nation-state. But some Jews have continued to risk popular disapproval by standing up for the dispossessed. The American Civil Liberties Union, for example, continues to supply Jewish lawyers to fight unfair policies of the United States government.

The situation in Israel is radically different from almost all previous Jewish experience. I would not presume to narrate the story of the last fifty years or to propose what policies should be followed today. I just note that Jews are finding how complex it can be to bring an ancient religion and a modern secular state into a working relation. Which takes precedence when there is conflict? What interpretation of the bible and Jewish history will influence state policies?

The Muslim relation to the modern nation-state is a very different story from either the Jewish or the Christian. Islam is a more overtly political religion, not content with a separation of religious and secular powers. The temptation to identify the religion with worldly power is great. But as with all religions, there are Muslim voices of protest when dominative and oppressive power reigns.

At present, Western countries hope that Muslim countries will become modern and accept the canons of European Enlightenment. That development may be both possible and desirable, but perhaps the more realistic hope would be for a religious education in the Muslim world that is other than indoctrination, which is as important as political and economic modernization.

Islam has never fully endorsed the idea of the nation-state, especially in those parts of the world where European nations carved out the boundaries of states. Islam puts its hope in the *umma*, the community of Muslims world wide. As Islam grows in number within the United States, Canada, Australia and Europe, it has a chance to work out a relation between religious and secular powers that differs from Christian ideology. In the United States the metaphor of church-state, which became legally enshrined only in the 1930s, is patently inadequate to discuss the many ways that religious and civil powers interact (Hamburger, 2002). The United States still cannot admit the need for some form of religious education in its state schools, a fact not unrelated to the widespread ignorance of religion among its citizenry.

I make the above sketches of the Abrahamic traditions to point toward the scope and complexity of religious education internationally considered. Most of us most of the time have to concentrate on our humble piece of an unimaginably complex picture. I am suggesting, however, a context for whatever aspect of religion we deal with. I do not think that one should go into the classroom every day to criticise the policies of the government. That would quickly degenerate into ideological rants. I do think we need to maintain a critical distance from the ideology that substitutes national chauvinism for a Christian, Jewish, or Muslim commitment.

I think that every religious believer has an ambiguous relation to his or her nation-state, even the kindest and gentlest state. A Muslim in India or a Christian in Indonesia may have a problem living in an open and democratic society. Each situation has its own subtle difficulties that have to be looked at in detail. Here I concentrate on the situation I know best: the United States of America.

Recent polls show that in practically every part of the world the United States is considered to be the chief threat to world peace (New York Times 2004). To most U.S. citizens that is surprising; they think of their country as peace-loving, as mediating the conflicts between other nation, as generous in helping the oppressed. The gap between these two perceptions is bewildering. Is the rest of the world blind with envy? Are people in the United States incapable of understanding their nation's history and its present policies? As for the explanation of other-nation-envy, I assume there is some resentment about one country using its economic and military clout, even when well-intended. Nonetheless, the main concern of every U.S. citizen has to be the perception of their own country by others and a willingness to be pointedly critical about their government's policies.

The reason that there is so little effective criticism either from within or from without the country is the confusion of the nation-state and a religious dream. From its very beginning, the United States identified itself with Europe's dream of the promised land. 'America' had been coined in 1507 with a double meaning: the name of a continent and the name of a fabulous place variously identified with the original paradise or the realised kingdom of God. When the British version of America separated from the empire and became a sovereign state, it called itself the United States of America. The most important of those four words is the third one: *of*. If the country had been named the United States in America, the continental meaning might have emerged as primary. Instead, by identifying itself with the religious dream, the continental meaning was swallowed by the religious connotations of 'America.'

At the beginning of the United States, its religion was an unsteady combination of Deism and Evangelical Christianity. After about 215 years of existence, the picture is remarkably similar. The Deists are still here, having pushed God further off the heavenly map. The Evangelicals, after getting pushed out of sight, are back stronger than ever. Catholics and Jews have increased in number but always with some trepidation about how they fit into 'America.' Liberal Protestant Christians are still in control of key positions in the country but with some worry about the shrinking size of their congregations.

To the rest of the world, the several hundred religious distinctions, called denominations, is of little interest. All of the different religions appear as variations on the country's all embracing religion, America. Unless the traditional religions can exercise restraint on that religion, America can be an excuse to do whatever leaders of the United States government wish to do. Who can possibly oppose God's mission to the world?

The difficulty in getting the problem stated is that the name United States of America is regularly shortened to America. If the country were the United States of America (instead of the states of Virginia, Massachusetts, New York, and so on) that would be logical. But reference to America in every few sentences spoken in the United States is a source of constant confusion. Europeans, originators of the dream, are of no help in straightening out the mess. They are always talking about Europe and America when they really mean Europe and the United States.

Terrorists are well aware that 'America' is the enemy; Osama ben Laden has had nothing to say about the United States but he is very aware of the effect of America throughout the world.

The problem, as I noted above, is more than two hundred years old. It may seem too late to change things. But two centuries is a short time in the life of nations and humanity. When Mao was asked whether he thought the French Revolution had been a success, he said it was too early to tell. The same could be said about the country born about the same time, the badly named United States of America. It sometimes is a force for good; it sometimes does terrible things, often inadvertently. Its greatest danger is that it has never considered itself one nation among many, subject to international agreements. Its foreign policy is confused with a religious mission to save the world. And the language it has taught the world to speak makes effective criticism nearly impossible.

What has always been a problem for the United States and the world has jumped in magnitude during the last few years. There was a moment between Sept 12 and Sept 16, 2001, when it seemed there was a possibility that this problem would be faced. The United States moment of reflection and restraint was swallowed by the metaphor of war; since then 'operation eternal war' has not had any serious opposition from within the country. America overwhelmed the United States. The absence of any sustained political, academic or religious criticism has been frightening. I am most disappointed by the left wing in this country. Supposedly, they populate the university faculties. But when it comes to 'America,' they speak the same language as the right. When they try to be critical they sound like they are attacking America (Coulter, 2003). No one will ever get anywhere in this country attacking America. They will be drowned out by liturgical hymns such as God Bless America and America the Beautiful. Criticism has to be directed at the United States, its government and specific policies of that government.

Catholics, Protestants and Jews have to bring to bear the resources of their traditions that are older than the religion of America. When the Sunday Eucharist in my church finishes the service with the singing of God Bless America, I have doubts that the U.S. Catholic church can find the place to stand. Probably no one religious body can mount an effective criticism of the United States' relation to America. During the civil rights struggle of the 1960s, Catholics, Protestants and Jews found some common ground. The task of criticising the nation itself would be a more difficult meeting place, but criticism is urgently needed.

The key to religious success in this country may lie in Islam finding its voice. Since 'America' from the beginning was a biblical image, Christians and Jews could find a place under its aegis, sometimes being absorbed by it and sometimes challenging America's ultimacy. Every other religion, including Islam, has had difficulty finding acceptance in 'America.' Ironically, while Islam is thought by many people to be the external enemy of the United States, the future of genuine religious life within the United States may largely depend on a vibrant Muslim community. If the United States could accept Islam, the religion of America might

finally receive some effective criticism. The critical interplay between America and Christian, Jewish and Muslim religions would signal the emergence of a field of religious education in the United States.

RELIGIONS IN THE POST MODERNIST ERA

Joanmarie Smith

Director, Spiritual Formation for Local Pastors

Introduction

In one of our earliest works, my colleague, Gloria Durka, and I published a model of God which we believe reflected the needs of the time especially epistemologically (Durka & Smith, 1976). This article continues that effort but by offering an analogy for all religious traditions, I hope to provide a framework for an appreciative ecumenism or at least a tolerance in an age that is cataclysmically threatened by religious divisions.

Part One: Knowledge as Imagination

Any foundational piece in the theory of education must, it seems to me, address the questions: What do we know? And how do we know? To date three dramatically different answers have been given to these questions. That shift from one answer to another marks three great watersheds in Western history. The shift turns on what people think of as grounding knowledge or how we determine that something is true. Classically, knowledge has been defined as justified true belief. How we justify a belief or on what grounds we conclude that an idea or perception is true tells us what knowledge is for us.

The first epoch is marked by the conviction that we know only what has been revealed. Revelation is the ultimate authority for anything we claim to know. Our earliest recorded history is religious history. God or the gods reveal to selected persons all that is needed to live a meaningful life. This era lasts until approximately the middle of the seventeenth century.

The second epoch lasts until the twentieth century and is characterized by the insight that we know only what we experience. ‘Show me,’ say U.S. Midwesterners, say succinctly capturing the epistemology of the era. ‘My senses will tell me what is actually the case; what is true.’ The scientific revolution of the seventeenth century

led to the enshrining of this notion of knowledge in the Enlightenment. It ushers in the modern era.

In our own time, many of our most revered thinkers believe that we cannot know in the classical sense. What we do is imagine and our most fruitful imaginings are called knowledge. ‘Truths’ seem to be no more than those beliefs about which there is a consensus.

In the Matter of Imagination

Knowing was such a totally engaging activity for the Israelites that it could include sexual intercourse among its referents. Today we must add the adjective ‘carnal’ to extend knowledge that far. Even so, students of knowing have become convinced or reconvinced that knowing is not just an activity of the mind but rather of body-mindedness. The imagination best designates the spectrum of body-mind powers with which we compose an experience (Hart, 1968, pp. 186–187). In fact, it is the imagination that makes our experience of reality possible by patterning and flavoring our world.

Patterning Reality

Defining reality as ‘that which is the way that it is’ or ‘whatever exists as it exists’ we sense that we have not said much. ‘A booming, buzzing confusion’ (James, 1829, p. 29) has content closer to our experience. Yet on our better days we do not experience reality that way either. We experience it as patterned, as a discrete set of things and relationships. The things may be grim and relationships may be tragic, but they are there. Or are they? Where do the patterns come from? Max Born, the Nobel Physicist (1954) who with his conferees in physics, the ‘hardest science,’ can be said to have ushered in what is called the post-modernist era with observations like the following:

We were taught that there exists an objective physical world, which unfolds itself according to immutable laws independent of us; we are watching this process like the audience watch a play in the theatre...Quantum physics however, interprets the experience in a different way. We may compare the observer of a physical phenomenon not with the audience of a theatrical performance, but with that of a football game where the act of watching, accompanied by applauding or hissing has a marked influence on the speed and concentration of the players, and thus on what is watched. In fact, a better simile is life itself where the audience and actors are the same persons. It is the action of the experimentalist who designs the apparatus which determines essential features of the observations. Hence, there is no objectively existing situation as was supposed to exist in classical physics (Born, 1956, p. 234).

I am told that the first vision of a person born blind whose sight has been restored is a wash of color. They do not see things; they do not see foregrounds and

backgrounds but simply a confusion of radiances. They must learn to pattern chair and lamp and background and foreground and red out of that confusion. We forget that we do not see chairs of red either. I have used the following approach to make the case that experience is our interaction with reality *after* it has been patterned or netted by our imagination.

Most people remember the question from philosophy or psychology 101 about whether or not the tree falling in the forest makes a sound if there is no ear to hear it. Oddly enough, however, many people do not remember the answer, 'No, if there is no ear to hear, there is no sound.' It seems so preposterous to some that it helps to whip out a transistor radio and travel around the dial and different bands. Everyone must acknowledge that the sounds were in the room before we had the instrument to access them. They also agree that the quality of the sounds coming through the airwaves depends upon the quality of the radio we are using. We conclude: stimulus + sensor = sensation. Then the question becomes, 'Do we ever have a pure, or raw, or uninterpreted sensation?'

To continue the discussion, I draw the above on the blackboard, whiteboard, computer screen or whatever passes for those tools of teaching today. The students are asked to say what they see. Most respond immediately, 'a triangle.' I explain that they do not see a triangle. 'Triangle' is a high level mathematical abstraction. Then some say three lines. But three is also an abstraction. There are no three things in the universe. There are only ones. Everything is unique (and one, and one, and one). And, as for lines, a line is a series of points having length, but no width. And points are geometric elements that have position but no size, shape, or extension. Now how could one see that or those? And so it goes, as people call out, 'black and white' and recognize that they, too, are abstractions. We conclude that we never have a pure or raw sensation; it is always interpreted. The point here, of course, is that we cannot say what we see the way we see it; the sight is always interpreted. We see 'as,' as a triangle, as three lines.

In other words, our experience of reality is mediated by interpretive schemes. Experience is not simply interaction with our environment (including ourselves) but is our interpreted interaction. The imagination casts a kind of netting upon reality. Not that we do not experience reality, we do. What we experience, however, is not so much the nature of the ooze-through but the shape, measurement, and imprint of the netting. The theory of knowing outlined here is sometimes called 'critical realism.' Two scholars in religious studies who explicitly use this theory are Ian Barbour and John Hick. See for example: 'The critical realist recognizes the

importance of human imagination in the formation of theories and acknowledges the incomplete and selective character of scientific theories...Descriptions of nature are human constructions but nature is such as to bear description in some ways and not others' (Barbour, 1974, p. 37). For a more recent treatment of this realism by Barbour see *When Science Meets Religion: Enemies, Strangers, or Partners?* (2000, pp. 75–78). The theory is also called a kind of neo-Kantianism. John Hick distinguishes it from Kantianism this way: 'We necessarily perceive the world as it appears to beings with our own particular kind of perceptual machinery. But the way in which it appears to human perceivers is the way it is in relation to human perceivers. In Kantian language, the phenomenal world is the noumenal world as humanly experienced' (Hick, 1985, pp. 104–105).

The work of cartographers provides an analogy. The lines of latitude and longitude with which they mark our maps are obviously a construct of human imagination. But this netting makes it possible to know where we are and to get where we are going. Just so, the patterning of all of reality enables us to know where we are and get where we are going.

Flavoring Reality

While the patterning or netting function of imagination may appear to be more closely related to the mind of body-mindedness, the flavoring function demonstrably involves the body. It is almost as if our models or patterns or imaginative constructs have sensible qualities; as if they have aromas, tastes, textures, colors, and perhaps even sound that more or less appeal to us.

As the ear shapes the sound, and our taste buds give us sour, sweet, bitter, and salty, so our imagination flavors our constructs in ways that cause us to be attracted or repelled by what we experience. It is this function of the imagination that politicians pander to in election years. We refer to it as 'the image.' But it is not so much a picture to which we react as it is a composite of picture, smell, taste, and sound communicated by how the vote-seeker comes through our netting – the 'feel' of the candidate. Much of these netting patterns and flavorings come from society and our individual backgrounds.

Sources of Our Patterning

Socialization is a prime source of our labeling, and language is the most obvious tool of socialization. But words are human constructions. In the Oxford English Dictionary, we can follow the derivation and entrance of words into English. In our own lifetimes we see words emerge (e-mail) and fade (thee and thy) and change meaning. In the King James version of the Bible, let meant hinder and prevent meant precede. Yet as loose and living as our language is, we have to learn it. We study and learn language the way we study and learn chemistry. In other words, although we recognise that any particular language is a human creation, the projection of a society, the language in turn shapes us and dictates how we must use it. The rules

of language reflect arbitrary agreements. Like the number of feet between bases on a baseball diamond, the rules can be changed at any time if a significant number of interested parties agree to the change. But until they are, one is judged 'wrong' if one uses a verb tense incorrectly, just as a baseball player is 'out' if he stops five feet before the base, no matter how convinced he is that the bases should only be eighty-five feet apart.

The examples from language and baseball also illustrate the situation that alone we cannot introduce a novel or changed interpretation into the mix. Peter L. Berger and Thomas Luckmann, authors of *The Social Construction of Reality*, refer to the circumstance that we cannot sustain a solitary interpretation; we need a plausibility structure, that is a community of persons who will support our proposed interpretation (1966, ff.). To invent words for which no one else knows the meaning is to engage in a futile exercise. Similarly, to 'discover' a law in physics that no one else supports is to forego the possibility of publication so that potential believers cannot even be rounded up. In our own day, it is also to forego funding, which makes the accumulation of credibility through validating experiments an impossibility.

Berger and Luckmann could have entitled their book *The Volley Ball Syndrome*. Reality is a ball kept in play by team of believers. As the believers fall away, perhaps to play in another game, perhaps to leave the game altogether in death, the ball is kept aloft with more and more difficulty until it is finally dropped and often judged by those in other games never to have been 'real' in the first place. The famous physicist, Max Planck, who introduced the notion of energy as quanta, wrote in his autobiography, 'A new scientific truth does not triumph by convincing its opponents and making them see the light, but rather because its opponents eventually die, and a new generation grows up that is familiar with it' (Kuhn, 1970, p. 151). The new generation then concludes that the opponents had been playing bad science all along.

We bring some awareness to our incorporation of the conventions that we call language or baseball or physics. There are other conventions, however, that seem to seep into our socialization, into our interpretive schemes of reality. Paradoxically, these cultural conventions seem to exercise more power over our interaction with reality than those of which we are aware.

Why should eating cat, for example, disturb us more than eating chicken? No reason. Yet I have seen people become physically ill at the prospect. In our culture we do not eat cat. Moreover, I would wager that if a Gallup poll were to be taken asking people which they would rather be accused of-being irreligious or smelling bad (here irreligious could be replaced by lying, stealing, adultery, perhaps even murder) I would wager that a large majority would choose irreligious. In our culture, cleanliness is not next to godliness, it supersedes godliness. Yet cleanliness is a relatively recent value and smelling clean even more recent.

Individual Structures of Our Interpretive Schemes

In addition to society's input to our experience of reality, we also bring our uniqueness to bear on our interactions in the form of our genes, our past, our current beliefs, and our commitments.

No two sets of fingerprints are alike. (Identical twins are the exception.) The pattern of our prints on everything we touch symbolizes the uniqueness of the way we touch the world. We are not usually as aware of the converse: that the world touches us through that pattern too. All our experience bears our unique imprint. What we hear, what we taste, what we see is filtered through this original relation to the universe.

The genetic influence on our experience is not limited to sensation. Whether we are genetically predisposed to have a surplus of fat cells will determine to a large extent how we interact with our world—at least three times a day every day of our lives. Our genes even suggest the way we will experience death by making us more susceptible to some diseases rather than others. Studies of identical twins separated at birth suggest that our knowledge of genes is on the verge of a breakthrough. Apparently, our genetic nature accounts for more of our traits and attitudes than we had ever imagined (Ridley, 2003, pp. 72–90).

The Role of the Past and Present

Through the years we continue to shape our uniqueness in the choices we make, the memories that we entertain, the beliefs we hold, the commitments we embrace. Our choices, like a sculptor's chisel chip away at our possibilities until a shape emerges. As we age, the shape hardens. Our choices diminish in number and extent as possibility disappears. A person who has chosen a career as an accountant must come to grips with the fact that she or he will never see the world as an astronaut does. Our choices shape what we see and when we see it. Our memories also shape what we experience. They lure or repel us in certain directions according to the flavor of the memory. A man may decide to include certain disciplines in the way he raises a child as result of memories of his own childhood. A woman may decide not to become a physician because of sad memories of an absent parent physician.

Our beliefs and commitments similarly direct and color our experience. Only people who believe that miracles can happen will see miracles; nonbelievers will see up-to-now inexplicable phenomenon. As one commentator phrased it, 'When I believe it, I'll see it' (Ornstein, 1977, p. 8).

Is Relativism Inevitable?

The discussion so far has done little to add to our confidence that we can get beyond relativism. If, in fact, knowledge is one's imagination patterning and flavoring reality, how can we determine which patternings and flavorings deserve our belief? Is knowledge simply a convention like eating chicken instead of cat? 'It's a free country,' as they say. Does that mean we are free to believe whatever we wish? What is lost in this excursion into 'what we know and how we know it' is the possibility of certitude. What has become problematic in the definition of knowledge as justified true belief is its specifying note: true. If the reliability of knowledge can be salvaged, it depends on the possibility of justifying beliefs. But before engaging in a salvaging operation, we should examine what we have lost when we have lost truth. If, in fact, we have lost it.

Models of Truth

Our most common notion of truth goes by the name ‘correspondence theory.’ If I say that it is raining outside and that corresponds to what is happening, I am said to have spoken the Truth. Trees falling in the forest notwithstanding, this model of truth is very helpful in the dailliness of our lives. It equips us to take umbrellas with us without too much soul searching. However, the correspondence theory of truth is like Euclidean geometry which enables us to navigate the planet well enough, but is not adequate to space travel. In the larger picture, the correspondence theory is inadequate too. Actually, it is inadequate in the smaller picture, but negligibly so.

Once we forego the possibility of access to reality as it is, we simultaneously forego the possibility of comparing our interpretations with the real thing. The consensus on what constitutes rain, however, is sufficiently universal—and perhaps trivial—that we can check the truth of the statement, ‘It is raining,’ by using the model of correspondence without anxiety. As the issues get larger, the capacity of the correspondence method to get at truth diminishes proportionately.

The Hebrew Model of Truth

Although the correspondence notion of truth is what we are usually referring to in our conversation, it is not the only one. Truth in the correspondence theory is a Greek concept that should not surprise us because *scientia* (knowledge) and science are Greek gifts to the west. Hebrew does not have an equivalent for truth in the Greek or correspondence sense. The Hebrew word, *emet* is probably closer to the Anglo Saxon etymology of *true* which most lexicographers see as *drew* or *tree* referring to the firmness of the tree. In other words, to be true was to be dependable, to be faithful. The relation of truth to trust in this theory is more than the obvious visible resemblance. To ‘plight one’s troth’ is Middle English for pledging one’s truth, that is, one’s fidelity, one’s trustworthiness.

In this Hebrew theory, an interpretation, a meaning *acquires* truth, becomes more and more credible, that is, more and more believable. Verification (literally: making true) is not a once-and-for-all exercise; it is an ongoing activity in which an interpretation accumulates credit or, as it were, trustworthiness. The process is not unlike the way we acquire a good credit rating. We do so by coming through in a creditable way every time we are put to the test by the presentation of a bill. Even after bankruptcy, we are likely to be able to find someone who will give us credit, who will trust us. So a failure of the evidence does not necessarily falsify an interpretation. However, a pattern of failures like a pattern of bankruptcies, while never establishing with certainty the falseness of a model of reality or the untrustworthiness of a would-be-borrower, make both less and less creditable.

Circumstances work to persuade or dissuade us of the truthfulness in the sense of trustworthiness of the interpretation, which is to say that verification is neither automatic nor arbitrary. It is the arbitrariness of the position that one position is as good as another that repels us. Also its irrationality. To hold that one opinion

is as good as another is to simultaneously say it is valid to hold that opinion that some opinions are better than others is also a valid opinion.

The Hebrew model of truth requires time, history, for the verification process to unfold. But even to initiate the verification process, we must commit ourselves to the possibility of truth. For example, one must actually marry to allow the value of the marriage to work itself out in time; one must commit oneself to the research program to learn of its validity down the line. There must be criteria, therefore, that help us to judge the prospective truth of an interpretation of reality. I turn to those criteria now.

Evaluating Interpretations of Reality

The eras of knowing described earlier (knowledge as revelation and knowledge as experience) contained in their descriptions the criteria for evaluating the interpretations of reality. In the first era, the criterion was correspondence to revelation. In the second, the criterion was correspondence to experience, sensible experience. In both these ages, at least on the face of it, the criteria were outside the evaluator. That is, the criteria are what we call 'objective.' To describe knowledge as imaginative constructs seems to condemn us to the most subjective of criteria –imagination. But we have criteria that have been used to judge imaginative constructs through all the age, namely aesthetic criteria. I submit that the interpretations we cast across reality are art objects. Let me commandeer the support of two outstanding philosophers of aesthetic theory to make my case. Suzanne Langer describes art, the activity and the product, as 'the creation of perceptible form expressive of human feeling' (Langer, 1957, p. 80).

John Dewey's (1958) contribution to the case is that of questioning our ordinary notion of art. In his book, *Art as Experience*, he argues against limiting art to what we find in museums or concert halls. He tries to 'restore the continuity between the refined and intensified forms of experience that are works of art' (p. 3) and the more common, everyday forms we project against reality to deliver our experience. According to Dewey, the interpretations that we have traditionally called art are to all interpretations what mountain peaks are to the earth. 'Mountain peaks do not float unsupported; they do not even rest upon the earth. They *are* the earth in one of its manifest operations' (p. 3). So there are symphonies and superstring theories that interpret our existence. And there are theories of marriage and child-rearing that are perceptible forms expressing human feeling. Dewey says art is what it does with and in experience. Our interpretive schemes give us the form and content of our experience more or less artfully.

The equation of interpretations of reality with art is helpful for several reasons. First, we do not expect our works of art to deliver reality as it is, but we do expect them to deliver it in a way that makes us experience reality in transformed ways, in significant ways, in ways that change the manner of our seeing and hearing.

Moreover, the rejection of relativism is central to aesthetic theory. There is a long tradition of criticizing art works, of recognizing that one piece of art or one

performance is not necessarily as good as another. There is also a tradition that extends back even farther than art criticism that somehow the good, the true, and the beautiful are three variations on the same theme, three interpretations of the same reality.

Finally, there is a tentativeness in art criticism. In evaluating, we try to discover the worth or worthiness of an interpretation of reality whether it is painting, a religious ritual, or the plank of a political party. My thesis is that the aesthetic mode of evaluation offers the most fruitful approach to estimating the value of any interpretation. Aesthetic evaluation draws on our best thinking and our most cultivated sensibilities. It is, if you will, reasoned feeling and feeling reason, a focused application of or body-mindedness.

Part Two: Religious Doctrines as Art Objects

Few would disagree that the most comprehensive interpretation of reality is, by definition, religious. Religious conviction permeates all the elements of one's life. A disturbing phenomenon, therefore, is the fact that so many religious enthusiasts are using the correspondence theory of truth in their evaluation of the worthiness of their commitment. At times this takes on absurd dimensions. A legislator in Texas, faced with a bill to make Spanish a second official language in the state, is reputed to have said, 'If English was good enough for Jesus, it is good enough for me.'

Unfortunately, most results of this approach to religious doctrine are more appalling than amusing. The wars that have raged in the second half of the twentieth century and into the twenty-first have been and are religious wars. Of course, cultural, ethnic, and tribal issues also feature in these hot spots, but almost invariably, the dominant difference between warring factions is religious. It is particularly disturbing because it seems that the major religions lend themselves wonderfully to a post modernist theory of knowing.

Orthodoxy and the Jews

'Orthodox' literally means straight or right *opinion*. *Doxa* was considered in Plato's discussion of knowing to be either conjecture or belief as opposed to *episteme* (knowledge) which was a grasp of reality as it truly is. The literal use of the term orthodoxy is quite consonant with the knowing as described in Part One. All we have to work with *are* opinions, conjectures, beliefs.

Historians and sociologists sometimes cite religion as the particular contribution of the Jews to our civilization. This valid conclusion flows from the fact that they proposed a model of God that became a criterion for what constitutes 'religious.' The Greek philosopher Xenophanes had employed an insightful touchstone to explain his ridicule of Olympic gods: *theoprotos*, 'that which fits the divine.' Yet earlier than Xenophanes, the Jews had recognized such a criterion as an elemental component of their relationship with the deities. God was not to be imagined, not to be named (Ex. 20:1-7; Deut. 5:6-11). This boundless concept of God allowed the Jews to

evolve the sophisticated notions of monotheism and omnipresence. It was also their dominating theology of a God who cannot be contained with genus and species definitions that allowed them to be freely anthropomorphic in discussions of God's relations with the descendants of Abraham.

We must thematise. We must speak. The perfect tribute will not remain silent. The difficulty lies in confusing the word with its referent. The construction of the golden calf illustrates the idolatrous nature of this confusion (Ex. 32:1–34). The brazen serpent, on the other hand, is healing because it is seen as a manifestation of God's power, but not God (Nm. 21:6–9). Similarly, the Jews (and Christians) are able to consider all the psalms as prayers although they are addressed to oneself, one's friends, enemies, all of nature, and God. God is not equated with any or all of these objects. Not even God. Had not God, when pressed for a name, answered, 'I am who I am'? Hebrews scholars tell us that this should be translated, not as the ground for a theory of God as being, but as the much more homely, 'Mind your own business!' God is that on which one cannot get a fix.

Orthodoxy and Christianity

Christianity preserves, reinforces and extends the Judaic intuition of a model of God than is beyond representation. In Christianity this insight is reflected in the fact that the major doctrines are composed of contradictions which might even be called oxymorons. The heresies of Christianity have always been attempts to eliminate the irreconcilables of the central doctrines. Heresies always make much better 'sense' than the finally hammered out dogmatic statements. The Arian and Docetist theses that Jesus was less than God or that God only appeared as man would have removed a number of problems that are only compounded in the attempt of professed monotheists to articulate a model of a triune God.

It seems that certainly one is on the right track when one conceives of God as the absolutely Other. When the participants of the Council of Chalcedon insist on defining the person of Jesus as truly God and truly human, what they actually do is say that even this most appropriate designation—'God as Other'—will not contain God.

Similarly, Nestorius proposed the reasonable compromise that Mary be ambiguously called Mother of Jesus. The Council of Ephesus, we might think rather blasphemously, counterpropounded that she is the Mother of God.

Unfortunately, most of these central pronouncements of the Church are called definitions. That is precisely what they are not. Definitions are the imposition of boundaries. What these so called definitions of the early Church did was to make it impossible to locate any boundaries or string any net of logic in which one could 'catch' God. They are closer to 'the sound of one hand clapping' of koans than they are to definitions. It is in this sense that they are appropriate models of God—dynamic because they incorporate contradictions, the kind of conflict that is literally fruitful beyond the capacity of any one age or all ages to imagine.

The best models suggest ever more than they can resolve. Nicholas of Cusa criticised the scholastic endeavor because it was based on the principle of non-contradiction: a thing cannot be and not be at the same time. Quantum physics suggests that the fifteenth century Nicholas was on to something. It is precisely the incorporation of contradictions that accounts for the magnitude in which contemporary physics is fruitful. Christianity incorporates outrageous contradictions: an imageless, unnameable God, one *triune* God, a God-man, a Mother of God.

An analogy that I have used that is not at odds with post-modernism and which picks up one of the use of aesthetic theory is to think of all great traditions as the score of a masterpiece *as well as* the musicians who performed the music, interpreting and playing or singing the score (Smith, 1995). What they make possible is our experience of the music. It is the music that is beautiful, the music we love. We may cherish the composer, appreciate the musicianship of the performers, acknowledge that both the score and performance are the conditions of experience, but it is still the music whose beauty arrests us.

As with all analogies, there are limits to how far this one can take us. A musical masterpiece is, after all, not a religious tradition. Yet similarities present themselves. For example, all religious traditions exist to put us in touch with God. It is the reality of God in which we are called to revel, not the tradition. The tradition is constituted by the score (scriptures, creeds, and rituals) performed by different peoples with different interpretations over the centuries. Practitioners of the tradition perform the score. The notations of a musical score may not kill, but they are certainly lifeless. They exist to be performed.

This analogy also speaks to the issue of relativism. Not every interpretation of the score of every performance is uniformly admirable. Interpretations that wander too far from original score court criticism from the musically informed; the grossly ill-performed is often recognized even by nonmusicians. Yet, novel arrangements or the use of new or different instruments can make it into the canon of good performances over time. The point is that there are standards of interpretation and criteria for performance that proscribe 'anything goes.' But they do not rule out the novel or an agreement upon new standards and criteria that the novel frequently generates.

The analogy of religious tradition with performed masterpieces illuminates the issue of dialogue between religious traditions. What musician worthy of the name is not open to hearing the beauty of other masterpieces or other interpretations of familiar works? In theory at least, musicians are open to critiques of their performance as well as critiques of their judgment about a masterpiece. Yet their very familiarity with the practiced performance of a beloved masterpiece is what can engage another to see the beauty they see, to hear the beauty they hear – perhaps to recognize it as masterpiece. The other may recognize that fact though never contract to perform the piece, embrace that tradition.

Pursuing this analogy can also shed some light on denominational affiliation and the issue of transcending cultures. One can treasure a particular masterpiece and a particular interpretation and performance for all kinds of personal reasons that are

no less providential for being personal. We are born into a particular time and place with its culture and its variations on our street and in our house. That fact both discovers and conceals the world to us. It conditions what foods we will enjoy, how we will be educated, whom we will marry, even if we will marry. The conventions of a culture shape what we will find agreeable and disagreeable, what we will pursue and what we will not notice, or having noticed, dismiss out of hand.

So musicians are more likely to treasure a masterpiece from their own culture. They are predisposed, as it were, to discern beauty there. As they grow in their knowledge of music and increase their skill in performing a masterpiece, they will continue to get fresh insights into its unique beauty if it can bear that sustained familiarity. If it cannot, they may look to another masterpiece for experience of the sublime.

There is no doubt that we are culturally conditioned to resonate to certain chords, certain kinds of melodies. But perhaps we make too much of that conditioning. If our cultures distinguish us, even separate us, our common humanity defines and connects us. If we eat different foods, we all have to eat, and we all need the same nutrients to sustain us, no matter their form. If we all have different languages, we all have language. If we all have different wedding customs, we all marry. And we all make music. And we all have gods-or at least ultimate concerns.

Cultural oppression exists where we try to make people take their nutrients in our form, speak our language, use our marriage customs, dance to our rhythms. We in the North Atlantic community, in this new millennium of the Common Era, sometimes forget that the notes that constitute the motif of our masterpiece come from an old Middle Eastern tribal melody. Its adaptability into thousands of languages and cultures stems from the fact that it strikes notes common to the human condition: birth, death, life after death, love and God. Regardless of what continents generated the musical score, it is the music we are called upon to appreciate, or in the language of Part One, 'the ooze through,' God (Smith, p. 4). Perhaps mystics must lead us through this century.

THE RELEVANCE OF A WISDOM TRADITION

Gary Finlay

Director, National Centre For Religious Studies, New Zealand

Introduction

From time to time we hear calls for religious education to be ‘relevant’ to the needs and interests of students, or we hear of a particular topic in a curriculum or programme criticised for being ‘irrelevant’ to such needs. This chapter asks the question ‘what is meant by ‘relevant’ in the context of Catholic schools or, *mutatis mutandis*, schools of other religious traditions? What makes a religious education programme or lesson relevant?’ After a brief consideration of the semantics involved, the chapter considers how what is relevant for the religious education of young people in a Catholic school is to be decided, and who is to do the deciding. It argues that one function schools are peculiarly suited to is the transmission of knowledge, and that it is a mistake for them to downplay this role in order to concentrate on the immediate experience of students in the name of relevance. There is no suggestion that the life experiences of young people should be ignored, but rather that there is a balance to be found. For Catholic schools this means that there is still a place for a deliberate, judicious and coherent attempt to pass on key elements of the tradition, including specifically experiential elements such as forms of interiority.

‘Not to know what took place before you were born is to remain forever a child.’ (Marcus Tullius Cicero)

The Maori people of New Zealand have a concept named *turangawaewae*. It means literally, ‘a standing place for the feet’, and refers to the sense of place and security given to Maori by their sharing in ancestral land rights. I have argued elsewhere that the cultivation of a sense of tradition can help provide young Catholics ‘with their own *turangawaewae* – a firm base from which, in religious terms, they can come to grips with the often bewildering variety of beliefs, attitudes and values which confront them’ (Finlay, 1987).

To advocate an attentiveness to tradition is to court the response that that such an approach is not helpful as it is irrelevant to the interests and needs of children and young people who are focused on 'the now'. This chapter addresses that response. Underlying my case is a sympathy for Neil Postman's 'thermostatic view' of education (Postman, 1979). Postman maintains that it is the task of the school to act as a counter-balancing agent to the biases of the surrounding culture. That culture is heavily shaped by the electronic media, which have a vested interest in instancy, immediacy and the fashionable; they are 'hooked' on the present and the new. From a 'thermostatic' point of view, what teachers should be doing in such a situation is offering a different perspective. As Postman puts it, 'What has most relevance to students is what the information environment least provides them' (Postman, p. 131). It is with such underlying assumptions that I have chosen to consider questions such as; 'what do people mean, in the context of religious education, when they say that a topic or a curriculum is relevant (or not relevant)?' and 'who decides what is relevant?'

In the Oxford English Dictionary the first meaning given for the word relevant is 'bearing upon, connected with, pertinent *to*, the matter in hand.' If we consider the components of that definition in reverse order and take the 'matter in hand' to be religious education in Catholic schools, then the question that naturally arises is, 'What is it that has a bearing upon, what is pertinent to, or what is relevant to religious education?' Of course, it may be objected, the question is not, or should not be, 'what is relevant to religious education', but rather 'what is relevant to the young people who are students, or the consumers, or the victims (depending on the stance of the objector) of this religious education?'

This immediately raises the whole matter of the determination of curriculum and another question, 'Who decides what is to be taught?' Questions around the matter of relevance extend beyond the field of religious education into the general debate about the purposes of education – the realms of philosophy of education. Here it is very easy to get bogged down in the trenches, or to get lost in the no-man's-land between the various forces fighting under the standards of Plato, Rousseau, or Dewey, not to mention being ambushed by the followers of Foucault. Notwithstanding these risks, the questions at issue have such significance for religious education that they merit an answer, however contestable.

So, who determines the curriculum? Who decides what is to be taught? In the 1960s after the publication of A S Neill's book *Summerhill* (Neill, 1960), about his school of the same name where students decided what, if anything, they wished to learn, there were a number of books and experiments with similar types of radical or free schools in various countries. Viewed from the perspective of the early 21st century none seems to have had much lasting effect (Ravitch, 2000). Neither did the call for the abolition of formal schooling heralded by Ivan Illich's book *De-schooling society* (Illich, 1971). I am aware that there has been an increase in the number of families opting for home schooling in some countries, but their motives for doing this are generally different from Illich's reasons for de-schooling (Stevens, 2001).

If students are not to set the curriculum then who is to decide? In most places the decision is made by the State. Even where private schools exist, their students often follow curricula and seek qualifications set by governments. As far as Catholic schooling is concerned, there exist varying types of financial and structural relationships between state and Catholic education authorities. But whatever the particular relationship between the Government and Church schools, and however that affects the general curriculum taught in Catholic schools, (which is an interesting issue in itself) the Church generally controls what is taught in religious education. Whether the general curriculum or the religious education curriculum is school-based, or determined by diocesan or national guidelines, what is clear is that pupils or students are not deciding what is to be taught. Why this is so is not usually stated, but rather taken for granted, presumably on the grounds that ‘adults know best’.

One likely objection to this approach is that it is paternalistic. But as Mary Warnock writes:

There is an important sense in which all education is paternalistic. And in the sense of education as having the task of handing down ‘High Culture’, the element of paternalism is ineradicable. For the concept of high culture entails the thought that someone other than the person to whom it is to be handed down shall determine, or have a hand in determining, what is to count as worthy of that description; and not just any other person, but some person himself brought up to love and respect the culture...The canon in some form or other is crucial to the idea of education; and so one among educational needs is that individual children have to be introduced to this canon, the encapsulation of the culture in which they live (Warnock, 2004 p. 142).

If we apply this viewpoint to Catholic religious education the parallels are clear: the ‘high culture’ we are trying to hand down is the gospel as mediated through Catholic tradition. The assumption is that Catholicism is the culture in which our young people live and to whose canon they need progressively to be introduced. The understandable point that some, or many, children and young people in Catholic schools may have scant understanding of Catholic culture and are in fact immersed in other competing ‘cultures’ seems to me simply to reinforce the argument in favour of the need for schools to do what they can to introduce students to the canon. After all, we have religious tradition to thank for the very concept of canon in this sense.

How young people are given access to the tradition is important too. But there are many aspects to this. As Mary Boys explains:

Access is given in numerous ways. To provide access means to build bridges, to make metaphors, to build highways, to provide introductions and commentaries, to translate foreign terms, to remove barriers, to make maps, to demolish blockages, to demonstrate effects, to energise and sustain participation, and to be hospitable (Boys, 1989, p. 209).

All of this presumes that the teacher understands more than the student about 'the matter in hand'. As Kieran Egan points out in *The Educated Mind*, this does not imply that the teacher has to talk down to or patronise students because:

This interpretation strikes me as a peculiar way of looking at an inevitable feature of adequate teaching. If the teacher has no greater understanding than the student, it is hard to see how the role can be justified. The central sensitivity and skill of teaching consists in presenting knowledge to students in a manner that is most accessible and most stimulating to their developing understanding. What some might represent as patronising might more properly be seen as a matter of courtesy (Egan, 1997, p. 275).

Elsewhere I have made a case (Finlay, 2002) that an important part of what teachers in Catholic schools should be engaged in is mining the tradition for elements that can help students find meaning and identity. Or, in other words, in encouraging them to seek wisdom. In recent years there appears to have been the beginnings of a revival of interest in wisdom by philosophers (Conway, 2000; Honderich, 1995, p. 912) and psychologists (Sternberg, 1995). Whatever the case for other disciplines, teachers of religious education in Catholic (and other religious) schools are the bearers of a tradition, derived from an original revelation, that offers access to wisdom. Revelation after all means that things are not entirely obscure. The veil has been lifted to show a Way. Examples of such 'relevant' elements in the tradition are story, heroes and silence. These may also be seen as 'tools' for integration.

One important 'tool' is undoubtedly story or narrative. If people are to find meaning in life, they need consciously or otherwise to have a larger story or stories within which to place their own story (Rossiter, 1996), and this notwithstanding the postmodern suspicion of grand narratives. John Carroll has recently argued that Western civilisation is dying for lack of stories:

The spirit cannot breathe without story. It sinks to a whimper, deflating its housing characters, and condemning them to psychopathology—literally, disease of the soul. So it is for the young in the contemporary West—teenagers, those in their twenties, the hope and pride of their societies—and with them, swathes of their more self assured elders. A malaise holds them in thrall, struggling to live in a present without vision of any future, or connection to even the organic tissue of being, their own personal past (Carroll, 2001, p. 6).

Michael Warren's question, 'Who is telling the Stories?' seems to me to be one of the most productive for religious educators or parents to ask when considering how the viewpoints and worldviews of children and young people are being formed. In 'stories' I include films, television soap operas, situation comedies, song lyrics and advertisements. Warren maintains that 'the dreams of the young do not just 'happen' but are planned and produced by particular persons' (Warren, 1992, p. 3). Warren makes a very good case for Catholic schools to give their students the means to take a critical

stance, and to raise their consciousness about the messages being fed to them through the information culture (pp. 47–48). I think that schools and parents also need to keep before children and young people the big story of Christianity as well as other stories from scripture and the living tradition which help them in a positive way to ‘imagine the kind of person they wish to be’ (Warren, 1992, p. 3). In other words, to help them form an identity. The significance of the development personal identity and the issues it raises for religious education have recently been usefully explored by Graham Rossiter (Rossiter, 2001).

A second ‘tool’ closely related to that of story is the importance of heroes. Traditionally stories are often about heroes. Young people need heroes, either real or fictional, to help them in their formation of identity. Some of the heroes or idols presented to young people by popular culture are of dubious value, not to say positively harmful. But consider the popularity of ‘Harry Potter’ and ‘The Lord of the Rings’, old fashioned stories of good and evil, of heroes and villains. John Carroll writes of the importance of the bedtime story ritual:

It was then that the world was given magical shape, the child identifying with the fairy-tale characters and mythic heroes, enraptured by the story in which it is Me who rides through the enchanted forest and kills the fiery dragon, Me whom the glass slipper fits. The spirit soars: there is a place, a mission, a way of living, the monstrously huge world outside not so daunting. Once upon a time (Carroll, 2001, p. 9).

For Catholic schools an obvious source of stories of heroes and heroines is the lives of the saints. Richard Rohr and Joseph Martos explain why this is so. ‘Catholicism is not so much a history of ideas as a story of people, and the people we call saints are the heroes and heroines of that story. They are at once the paragons of Christianity and the paradigms of Christian living’ (Rohr & Martos, 1989, pp. 111–112). The ranks of inspiring men and women are not limited to canonised saints of course, nor to the ranks of Christians. Alert teachers will find many other stories of heroes and heroines, both historical and contemporary.

The saints are many and varied so they provide a range of models. What saints have in common is that they were prayerful. This brings us to the other ‘tool’ that Catholic schools can draw from the tradition to help students find meaning and identity today. It goes by many names; prayerfulness, interiority, inwardness, and meditation to name a few. Whatever it is called it is about enabling and allowing people to learn to ‘Be still and know that I am God’ (Psalm 46:10). Whatever it is called, no one should doubt its importance. Jerome Berryman explores the link between silence and imagination and concludes that ‘silence is necessary for human beings to communicate and create existential meaning’ (Berryman, 1999). Berryman maintains that because our busy postmodern culture is in danger of losing the ability to learn through silence, religious educators have a duty not just to their traditions but to humanity at large to foster the ability to know in silence. Berryman is not alone in this view. In the light of his experience of running courses in spirituality for university students David Tacey, too, has noted the importance of inwardness and

notes that 'religion need not be considered an obstacle to spirituality, but a resource for spiritual wisdom and insight' (Tacey, 2003, p. 103).

So, while communal worship and the other community dimensions of life in a school can and should be fostered, the element of truth in the often quoted phrase of Karl Rahner that 'the Christian of the future will be a mystic or nothing' must also be recognised.

The importance of not ignoring, but of going beyond personal experience in gaining access to a wisdom tradition is argued by Andrew Wright when he writes:

the cultivation of wisdom is dependent on our acquiring the humility to learn from others. Despite the claims of many post-Enlightenment philosophers, both modern and post-modern, we cannot simply rely on our own experiences in attempting to understand reality since all we are likely to end up doing is projecting a make-believe world that conforms to our own needs and expectations. We are not isolated individuals forced into a solipsistic self-reliance in our search for truth, but relational creatures whose understanding is dependent on our ability to learn from the insights of others by immersing ourselves in tradition and culture...Authentic freedom lies not in making arbitrary choices on the basis of personal preference, but in making wise and informed choices guided by the rich legacy of human wisdom (Wright, 2004, p. 61).

Wright goes on to argue for the virtues of what he calls 'critical religious education' which 'needs to combine a fundamental openness towards a range of horizons of meaning with the cultivation of a reflective wisdom capable of empowering students to negotiate their way through an increasingly complex cultural context.' Such an education, Wright argues, will strive 'to fulfil its transformational potential by opening pupils up to questions of ultimate truth and cultivating appropriate levels of religious literacy' (Wright, 2004, p. 221).

Wright's book, published in 2004, is entitled *Religion, education and post-modernity*. So, as might be expected, it is up to date and engages with all 'the usual suspects': Baudrillard, Cupitt, Derrida, Foucault, Rorty et.al. But there is a sense in which what Wright is advocating is in line with the educational ideas of two of the great Catholic scholars of the twentieth century, both of whom wrote books on education, and whose views now seem prophetic.

During the Second World War, French philosopher Jaques Maritain delivered a series of lectures at Yale University which were published as *Education at the crossroads*. As a Thomist, Maritain was concerned with ends, and in the style of the time, he described the end of education as 'to guide the evolving dynamism through which man forms himself as man.' He points to the fact that because humans are pre-eminently cultural beings 'endowed with a knowing power which is unlimited and which nonetheless only advances step by step,' they cannot progress in their own lives, intellectually and morally 'without being helped by collective experience previously accumulated and preserved, and by a regular transmission of acquired knowledge' (Maritain, 1943, p. 2).

Two decades later the cultural historian Christopher Dawson published *The crisis of western education* in which he considered the role of Christian education in a Western culture that was becoming increasingly dominated by economic and technological concerns while drifting away from its religious roots. Dawson maintained that ‘the vital problem of Christian education is a sociological one: how to make students culturally conscious of their religion; otherwise they will be divided personalities – with a Christian faith and a pagan culture which contradict one another continually’ (Dawson, 1961, p. 187). That, it seems to me, remains a valid description of our present situation.

Dawson continues, ‘We have to ask ourselves, are we Christians who happen to live in England or America, or are we English and Americans who happen to attend a church on Sundays?’ (Dawson, 1961, p. 187). Substitute your own country for England and America and this may still seem like a good question to ask yourself today.

In the same book Dawson identified the essential feature of what he called the democratic technological society, what today is more likely to be referred to in terms of late capitalism or globalisation. ‘The system exists primarily to satisfy the material needs and demands of the consumers, and these demands are artificially determined by the advertisers who are the agents of the producers, so that the whole system has a circular movement and feeds upon itself’ (Dawson, 1961, p. 197). More recently John Hull has written of the corrosive effects of the ‘money culture’ on spiritual traditions which limit their ability to pass on their ideals to a younger generation (Hull, 1999). Despite such difficulties, however, the classroom is one of the few places in our society that offers the opportunity of providing some critical distance from the commercialised, media-driven information environment and its related popular culture in which students (and all of us) are more or less immersed. As Leslie Savan points out, ‘the real masterwork of advertising is the way it uses the techniques of art to seduce the human soul. Virtually all of modern experience now has a sponsor, or at least a sponsored accessory, and there is no human emotion or concern...that cannot be reworked into a sales pitch’ (Savan, 1994, p. 3). Chris Ayres recently reported a manifestation of this trend in an article in *The Times*. He wrote, ‘The fast-food company blamed by many for an obesity epidemic and the spread of childhood diabetes in the US is offering rappers \$6.80 every time their snack inspired track is played on radio. McDonalds hopes to have several songs in the Billboard chart by the summer, according to *Advertising Age* (Ayres, 2005).

My contention is that we should think twice before drawing our measures of what is relevant to the religious education of young people largely from their own limited experience, which tends to draw heavily from the less-than-pristine springs of contemporary popular culture. We should have the good sense to ‘drink from our own wells.’ If anything, there is more truth today in Michael Warren’s insight that many young people are ‘imprisoned in a world of immediate experience’ than when he first wrote it (Warren, 1986, p. 104). One of the tasks of a teacher is to liberate young people, to help them break free of the media-constructed view of

reality that imprisons them. Teachers should not be limited by the young person's perception of what is relevant. Rather, they should be helping the young to raise their sights and to penetrate deeper.

Students need a framework of knowledge against which current concerns can be understood and evaluated. Thus, as I write there is a media ferment around the election of a new Pope. It makes sense to deal with this currently popular topic in the religious education classroom. But in the wider context of a young person's education the whole question of the position of the Pope in the Catholic Church, including the doctrinal, historical and ecumenical aspects should be part of what students learn regardless of whether there is to be a change in the incumbent Pope.

How all this is taught to students of different ages is of course very important. We can learn from the experience of the teacher who taught a class that Cardinal Wolsey aimed at the Papacy and read in an examination answer that 'Wolsey shot the Pope'. None of what I have been saying should be taken to mean that I am in favour of subjecting students to dull and boring lessons or 'inert knowledge'. Any good teacher will find ways to use the interests of their students as a 'way in' to a topic, but that is not to say that only what is of immediate interest to students is 'relevant' to their education as Catholics, or simply as human beings. As Mary Warnock writes:

whatever the source of the curriculum, the good teacher will believe in it, make what he teaches seem worth learning, and above all, never bore his pupils..... This is not a trivial point. Our poor record of staying-on rates at school is to a large extent explained by the boredom children experience there. They sense that what goes on at school is a kind of ritual in which they have no concern. The good teacher is the person who will break down this barrier of apparently pointless ritual, will make the curriculum accessible to the student, by whatever means, and will give him the satisfaction of short-term aims successfully achieved. These aims need not always be what would be called 'relevant', or directly related to the outside world. A good teacher can make a student think a subject interesting and worth pursuing, or a skill fascinating and worth acquiring, whether or not this knowledge or this skill is seen to be directly useful (Warnock, 2004, p. 162).

So this is not a call to be unimaginative or backward looking or to shut ourselves off from new ideas, whatever their source. Rather it is a plea to consider such ideas against the insights of our own sources of wisdom and to accept, modify or reject them in that light.

At the end of his book on faith and culture entitled *Clashing symbols*, Michael Paul Gallagher reflects on the importance in his life of the roots given him by growing up in Collooney, a small village immersed in the Catholic culture of Ireland. As he walks through the streets of Rome on his way to the university to

teach theology he looks at the young people around him and wonders about their religious roots or lack of them:

I sense them drifting on the surface of themselves: where do they have languages of wonder that might open towards God? I feel that they have much to give but few channels for giving. They seem to me more like victims of this moment in history than lost in laziness or egoism. I picture them, spiritually, as uncalled, unawoken, unreached by the Truth that for me is at the centre of Life. What is missing? That unity of culture that Collooney gave me, except that for them it would have to be chosen and created – because their more broken context leaves them (and me, in ways) more stranded from reality, from our true humanity, from God (Gallagher, 1997, p. 148).

If this is an accurate depiction of ‘la condition post-moderne’, and I take it to be, then the question that arises for me is, ‘What role can Catholic schools play in providing what is missing in helping to create the ‘unity of culture’ that young people might choose?’

Gallagher recognises that the village world is gone for most people. He asks, ‘Where will the children of the city find anchors and roots? In family experience which is the core stability in spite of cultural change? In encountering the stories and symbols of God through the Church? What experiences and images could liberate their hope and incarnate the gospel for them?’ (Gallagher, 1997, p. 149). I recognise the importance of Gallagher’s point about families, but that is not our concern here. But as far as stories, symbols, experiences and images go surely the Catholic school has a role in making these available to young people. I have already commented on the importance of stories but the importance of symbols should not be neglected. For as Andrew Greeley points out:

Recovering and rearticulating our symbols is part of the task of religious maturation, the journey from what Ricoeur calls the ‘first naivete’ to the ‘second naivete.’ It constitutes the phase of ‘criticism’ in our religious growing up in which we analyse and unpack our symbols, take them apart to see what they mean, and then put them back together again. It is that part of our journey in which we progress from the simple faith of a child to the sophisticated faith of the adult, from making the sign of the cross with holy water when we enter the church because everyone else does to understanding that we are renewing, however briefly and however occasionally, the exchange of promises made at baptism (Greeley, 2004).

The Australian epidemiologist Richard Eckersley’s recent writings on the psychosocial problems among young people have focussed on ‘their possible cultural sources, including rising individualism, and the young people’s particular vulnerability to the failure of modern Western culture to do well what cultures are supposed to do: provide webs of meaning that shape the way people see the world,

locate themselves within it and behave in it' (Eckersley, 2004, p. 162). My view is that this is what the Catholic school, (or any good religious school) is peculiarly able to do—help provide 'a web of meaning'. A Catholic school will to this partly by providing an experience of Christian community, and partly by teaching young people how Catholic tradition can provide meaning for their lives in the world of today and tomorrow.

As well as his research work, Eckersley gives many talks to varied groups on progress and well-being. He writes:

Of all the graphs and diagrams I use in my talks, the one that many people most respond to and request copies of (and one I am often hesitant to use because of its 'Sunday school' flavour) is a table showing St. Thomas Aquinas's seven deadly sins (pride, envy, avarice, anger, sloth, lust and gluttony) and cardinal virtues (faith, hope, charity, prudence, fortitude, temperance and religion) and their reversal by modern consumer society. I think this is because it encapsulates, simply yet profoundly, our predicament (Eckersley 2004, p. 264).

What are those us involved in religious education to make of that?

Both Gallagher and Eckersley, from quite different perspectives, see the importance of providing young people with hope. What better grounds for hope do we have than the Good News? Do we not believe that our faith gives us 'a reason to live and a reason to die' and that we are helping young people to come to the same understandings? Albeit that, in a school classroom, we will be doing this in an intentionally educational way rather than through catechesis *per se*.

Gabriel Moran has argued for a view of education that allows, paradoxically, for both growth and 'end'. He writes that

one way to summarise this picture is to say that education is about 'tradition,' that it is about the transmission of what is most valuable from one generation to the next. Such a contention flies in the face of most twentieth-century writing on education which denigrates tradition. I think that sooner or later tradition has to be restored and that its close associate, transmission, has to be saved from the numerous thrashings it has taken. There is an aspect of education that concerns the criticism of tradition; however, one cannot criticise it until one recognises that it is within us and all around us. Education does not hand on tradition; education is tradition, the process of handing on, and within the process the asking of critical questions about the past (Moran, 1989, p. 49).

Catholic schools can play their part in helping young people find both meaning and belonging. Religious education can help enable students to see their lives as part of a bigger story – what used to be called 'the greatest story ever told'. In fact a grand narrative *par excellence*, and what could be more relevant than that?

THE MORAL DEMANDS OF CONTEMPORARY LIFE AND CHRISTIAN MORAL EDUCATION

Harold D. Horell

Graduate School of Religion and Religious Education, Fordham University

Introduction

Rick is an engineer who works for a defence contracting company. After participating in an adult religious education program I offered he approached me and asked if I would serve as a sounding board as he reflected on his life. He raised specific questions about the potential for the immoral use of the weapons system he had just been asked to design, and wondered if he should request that certain design specifications for this project be changed. He then drew insight from Catholic Social Teaching in raising broader concerns about the morality and/or immorality of the defense contracting work he had done for the past twenty years and how he could use his professional expertise in ways that would be life-giving rather than death-dealing.

Roberta is a lawyer. A colleague and friend of Roberta's was suspended and later resigned from the firm for which they worked. He admitted to showing a serious lack of judgment in offering recommendations for a man whom he knew had faced multiple charges of serious sex offenses. This colleague approached Roberta for help and support. After Roberta found out as much as she could about the situation she sought my counsel as she struggled to answer for herself the questions: 'Do I have a moral obligation to try and help my colleague Tom, or is the morally best thing to do to step back at this point from my friendship with Tom? How might Christian faith serve as a resource as I strive to cope with this situation?'

(The above stories are based on actual events. Names and details have been changed to protect the privacy of those involved.)

There has always been, to some extent, an emphasis on Christian moral responsibility in the world, on the importance of Christians striving to connect their faith in meaningful and morally responsible ways with their everyday lives. As a pastoral minister and Christian religious educator, I have followed this emphasis

in the Church and would venture that today it is becoming more pronounced and has taken on a distinctive character – despite the fact that there is often greater moral ambiguity and confusion in our everyday lives. Generally, in our increasingly complex, multi-faceted postmodern era there is a tendency within the pastoral life of the church to move away from understanding Christian faith as providing an overarching conceptual and explanatory framework of knowing and to move toward a greater focus on faith and ethics in everyday life; that is, on faith as providing pragmatic, now-centred guidance for moral reflecting and acting (See for example, Grenz and Lowe, Eds. 1986; Diehl 1991).

In this chapter I propose that the church would benefit from a more intentional and concentrated focus on Christian moral education aimed at helping to enable people to meet more fully the moral demands of everyday pastoral life, the demands of Christian moral responsibility in the world. I begin by examining why pastorally focused Christian moral education has not become a major concern in the church. Then, to develop further and illustrate my proposal I examine from a religious educator's perspective two pressing pastoral issues in the church today: the problem of the specificity of Christian convictions in a world where not everyone is a Christian, and contemporary confusions about the nature of moral reflection. I write from the perspective of a Catholic living in the United States. While my analysis inevitably reflects my specific life context, I have tried to write in such a way that my perspective will resonate with Christians, and to some extent with people from other faith traditions, whose life situations are different from my own.

Moral Inquiry and Moral Education in the Life of the Contemporary Church

At the academic level, Protestant ethicists have devoted concentrated energy for over a century to exploring the implications of the Christian gospel for personal and social morality. In the same period of time Catholics have developed and refined the tradition of modern Catholic social teaching. Moreover, many Catholic moral theologians began to work closely with their Protestant colleagues after the Second Vatican Council as they sought to broaden the scope of moral theology by moving beyond a narrow focus on sins and the sacrament of reconciliation and developing an openness to exploring how Christian faith can shed new light on all of life's moral concerns (Long 1967; Gustafson 1978; Massaro 2000).

Protestant and Catholic ethicists have provided valuable resources for Christian decision making through analyses of complex issues of moral reasoning concerning health care, business and economics, law, the natural environment, war and peace, global development and other issues. (For a summary and analysis of literature on decision making from a Catholic perspective see McCormick 1981 and McCormick 1984.) They have also helped us to understand our deepest moral aspirations as persons through explorations of such issues as virtue and character (e.g., Hauerwas, 1974, 1981; Keenan 1996), and the connections between morality and spirituality (e.g., Billy & Keating 2001; Gula 2003). Still, there is one area that Christian

ethicists have not explored in great detail: Christian moral education at the pastoral level of church life. More fully, Christian ethicists have not tended to focus on everyday moral issues, like those voiced by Rick and Roberta in the above stories, with the intention of helping to enable Christians to address the moral concerns of everyday life in the light of Christian faith.

We can recognise one reason for the lack of attention to issues of Christian moral education at the pastoral level when moral reflection is seen in a theological perspective. Theology is, essentially, reflection about God, human experiences of God, and God's relation to humanity and the world. Pastoral or practical theology focuses primarily on the present life of the Church in the world. Included among the disciplines of pastoral theology are religious education, pastoral care and counseling, pastoral liturgy, and spiritual care. Pastoral theology is connected with but distinguishable from historical theology, which has a greater focus on the past, and systematic theology, which leans from the present toward the future and the achieving of greater systematic coherence and completeness in theological reflection. Christian ethics and social ethics are primarily pastorally oriented disciplines that also cross over into systematic theological enquiry. A primary paradigm within Christian ethics is to begin with specific pastoral issues, but to focus on offering as systematic and complete analyses of these issues as possible in order to provide resources that can be drawn upon when the same or similar issues arise in the future. One of the clearest articulations of this paradigm is presented in Potter, 1972.

Even though the scope of Christian ethical enquiry has expanded in our contemporary era the focus remains on moving from present pastoral reality toward systematic coherence and completeness. In most instances, Christian ethicists have not emphasised the importance of Christian moral education or maintained a focus on the present pastoral life of the church with the intention of helping to enable Christians to understand everyday moral concerns in the light of Christian faith. (See O'Connell 1998 for a noteworthy analysis of the limitations of the current paradigms of Christian ethics, and a proposal to address the lack of effective moral education in the church.)

Christian religious educators have devoted more attention to Christian moral education than Christian ethicists. In some instances they have been able to provide significant studies by mirroring the primary approaches and methodologies of their colleagues in ethic; thus, offering systematic analyses of complex moral issues as educational concerns (e.g., Toton 1982) or focusing on how we might develop our deepest moral aspirations in the light of Christian faith (e.g., Dykstra 1981). At other times, Christian religious educators have commented on the failure to bring the academic and ecclesial resources of the church to bear on issues of everyday morality. (See O'Hare, ed. 1983, especially the essays by Boys and Tom.) Religious educators also often integrate a concern for justice or moral issues into their approach to faith formation (e.g., Groome 1998, chapter 8; Moran 1981, chapter 11; O'Hare in O'Hare, ed. 1983).

Still, Christian religious educators could enrich the life of the church by focusing more intentionally on Christian moral education at the level of the pastoral life of the

church. This can be seen more clearly once we reflect on the areas of overlapping concern and difference between Christian ethics/social ethics and Christian religious education. As noted above, at a foundational level Christian ethics/social ethics and Christian religious education are pastoral disciplines. They are concerned with the present life of the Church in the world. Moreover, Christian ethicists and religious educators are both committed to promoting rigorous analysis and greater understanding of Christian moral concerns. The difference between the two lies in the fact that Christian ethicists are most concerned with distinguishing moral concerns from other aspects of life while religious educators, in striving to foster a holistic understanding of faith, tend to focus on the connections among religious convictions, moral reflection and action, and spiritual and liturgical/sacramental practices. Christian ethicists and religious educators also tend to differ insofar as they adopt divergent approaches in interacting with the broader faith community. Ethicists tend to engage in moral reflection and offer the fruits of their efforts as a resource for others to use. In contrast, educators foster abilities for understanding and reflection in people so that they can deepen their understanding of themselves and become more intentional in their relations with others and God.

Now, insofar as religious educators are influenced by the approaches and methodologies of ethicists they tend to be more concerned with systematic completeness in moral understanding and to move away from a focus on the dynamics of everyday morality. Religious educators have helped Christians to address world hunger, poverty and other social issues, integrate a sense of justice and the importance of morality more fully into the process of religious education, and provided general guidelines for fostering Christian moral character and virtue. Yet, they have not addressed fully the existential demands of everyday moral living. Moreover, even though Christian religious education often includes a concern for moral formation, the holistic focus of the discipline has tended to keep religious educators from devoting concentrated attention to ethical issues and, for the most part, recognising and responding as fully as possible to the increasing need for pastoral moral guidance in the church today. While religious educators have offered moral guidance in a variety of ways, they have not addressed fully, for example, the kinds of questions that are raised by the two cases given at the beginning of this chapter, questions about how we as Christians can draw from our faith convictions in meeting the moral demands of an increasingly complex, religiously plural and often conflictual world.

I propose that greater pastoral moral guidance for people seeking to make a fuller connection between faith and everyday moral life can be provided by an approach to Christian moral education that combines the concentrated emphasis on morality found within the disciplines of ethics with the educational concern for enabling people to become more intentional and directive in their moral lives that is found in Christian religious education. In the following sections I develop my proposal further through a discussion of two specific issues: the problem of the specificity of Christian moral convictions, and contemporary confusions about moral reflection.

Addressing the Issue of Being Specifically and Distinctively Christian

When Faustin Pipal was Vice-Chair of the St. Paul Bank for Savings he commented on a decision-making situation about where to locate the banks' headquarters as follows:

Either alternative was a risky business decision: pump millions of dollars of mortgage money into a visibly deteriorating neighborhood or move our corporate headquarters and develop new markets and a new client base. In the early 70s I drove through Oak Park, Illinois, every morning on my way to work; and it wasn't a pretty sight. Panic peddling was beginning. Banks had stopped making conventional mortgages. Landlords deferred maintenance on apartment buildings and home owners were losing their pride of ownership. My bank decided to stay. That was 20 years ago and our decision changed the face of that community and the future of our institution.

For Pipal that decision making process was as an exercise in Christian stewardship. Pipal noted that his understanding of 'the common good and a higher power,' and his efforts as a Christian steward to take into account the views of 'all the stakeholders – employees, customers, suppliers, and the community' – influenced the way he assessed the moral dimensions of that and other business situations (Pipal 1992, 1 and 4).

Pipal's words and actions illustrate a contemporary concern for linking Christian faith and everyday life. Today many Christians are turning to resources within Christian faith traditions for expressing their deepest moral sensibilities and intuitions. Still, many Christians are struggling to discern how moral notions grounded in specifically Christian perspectives can provide general moral standards or be the basis of moral dialogue in a world that is increasingly pluralistic, where people of a wide variety of religious and secular traditions interact and address together issues of public morality and common social concern. Concretely, in cases like that of Faustin Pipal when not all of those involved in discussion and decision making are Christians, we find ourselves asking: How can our specifically and distinctively Christian moral convictions become part of a process of reflection and action that often involves Jews, Muslims, secular humanists and people of other faith traditions?

The beginnings of a solution to the problem of Christian specificity can be found in a distinction made by David Tracy between the origins and effects of the resources of Christian faith traditions. Tracy first notes that classic works of art or literature, while they have their origin in a specific time and place, can have an effect or influence far beyond that time and place. For instance, Harper Lee's novel *To Kill a Mockingbird* chronicles how a specific family responded to racial prejudice in a small, southern United States town in the mid-twentieth century. Yet, it is a classic of literature because its portrayals of integrity and respect for human dignity offer insight and inspiration for people living in diverse life situations. Tracy then suggests that some of the resources of Christian faith traditions can

have value beyond the boundaries of Christian communities and in some cases can become ‘classics’ when they help people in diverse life contexts express their deepest thoughts and feelings or express possibilities for human living that can be applied in a wide variety of situations. For instance, Pope Leo XII’s *Rerum Novarum* can be considered a classic of social ethics because its analysis of the rights of workers has affirmed the moral sensibilities of many people of good will and has been used to foster moral consensus among people of diverse religious, social and political backgrounds. Similarly, understandings of ‘human dignity,’ ‘the common good,’ and ‘solidarity’ that are grounded in Christian faith convictions have become basic moral principles within our society because they express the moral sensibilities of people, Christian and non-Christian alike in a wide variety of life situations (Tracy 1986).

To address the problem of Christian specificity fully we must also consider the relationship between Christian moral insight and the world beyond the church. In pastoral moral discussions we sometimes hear the expression ‘the church is called to be counter-cultural,’ meaning that the moral wisdom of the church is to challenge immoral practices in the broader society. Indeed, in addressing the harsh realities of prejudice, violence, and inequality a counter-cultural Christian moral stance has often been of great value. However, the church can never be purely counter-cultural. Christian faith is always expressed within culture and the moral outlooks of members of faith communities are always grounded to some extent within the culture or cultures of their everyday lives. Moreover, only in extreme circumstances would a faith community intentionally choose to maximise the extent to which it is counter-cultural. Most often Christians support political processes, social institutions such as the family and marriage, legal systems, and other social structures to the extent that they encourage the flourishing of life.

As a general guideline we can think of specifically Christian resources or resources grounded with Christian faith communities as offering moral insight that can be challenging, confirming, cautionary or some combination of these three (see Tracy 1986, 119–120). First, moral insights originating in Christian faith communities and then presented in broader social or public spheres may at times cause a ‘shock of recognition’ that reveals moral shortsightedness, insensitivity or immorality (Tracy 1986, 120). At such times, moral insight grounded in Christian faith may be challenging and prophetic. For instance, Martin Luther King, Jr.’s *Letter from Birmingham Jail*, in which King discusses how his faith led him to travel from Atlanta to Birmingham to take part in an illegal protest against racial segregation, has become a classic of United States history, literature and culture. During his lifetime, King challenged oppressive structures in American society and people of many differing backgrounds who read King’s letter today are challenged to recognise unjust and discriminatory practices within their own societies.

Second, there are many instances in which the resources of Christian faith traditions affirm the authentic values of the broader society. For instance, some Christians, especially ordained and lay ecclesial Catholic ministers, regard the United States Catholic bishops documents *Faithful Citizenship*, a call to political

responsibility through participation in the political process, and *A Family Perspective on Church and Society*, which affirms the family as an important social institution, as having the potential to become religious and social classics. They not only offer moral guidance in addressing issues of political participation and family life, they also provide a framework for helping us as Christians discern when and how we are called to affirm the broader culture of which we are a part. For people outside Christian faith communities these documents and the ideas presented in them have at times led to greater understanding, appreciation and respect for the political process and family life.

Third, there are times when the resources of Christian faith traditions lead us to approach social movements and proposed social advancements with caution. For example, I once met a researcher doing work on tissue regeneration who discussed the ethical guidelines he followed in terms of a Christian understanding of 'sin' and 'human dignity.' His research had the potential to advance the technology needed for cloning mammals. Based on a sense of the potential for the sinful misuse of the medical technologies he was designing, he proceeded very cautiously in developing and publicising his research. He also noted that in his work with human subjects a Christian conception of respect for the dignity of the human person was his most important cautionary guideline in determining what he would and would not do. Moreover, the researcher recommended that his colleagues, Christian and non-Christians alike, use understandings of 'the potential for evil use' and 'human dignity' as moral principles to guide them in their work.

When we as Christians draw insight from the resources of Christian traditions in social and public forums of moral discourse we need to adopt an attitude of openness and respect toward our dialogue partners. To begin, we must always admit our own sinfulness and even the presence of sinful structures within the church. Hence, just as we as Christians may question the broader culture, we must expect to be challenged in turn. Indeed, there have been times when the church has been renewed by the moral wisdom of those beyond the church, such as the times in the past when the broader society challenged the church to renounce its support for the practice of slavery. Additionally, there needs to be a genuine respect for the religious and personal freedom of all people of good will who we as Christians encounter in the broader social world. The Mystery Who is God makes God's Self known in many ways, and often we are called simply to marvel at God's presence within the various cultures and peoples of the world. At the same time, our respect for others must always have an invitational quality. Some people, once they recognise the influence of Christian moral ideals in broader social and public forums, will want to explore more fully the source, and our Christian understanding of the Source, of those ideals. We must be open to inviting them into our faith communities and homes and to sharing our faith with them.

Drawing from the resources of Christian faith traditions in broader social and public discussions requires balance and practical, prudential judgment and discernment. Because contemporary life is ambiguous, complex and demanding it is impossible to pre-program or plan in advance for all the situations or even types

of situations that we are likely to encounter. Moreover, in our present, pluralistic postmodern era the complexities of life are increasing. Often times we as Christians cannot discern whether to challenge, confirm or proceed with caution, to push forward in making a point or to stop, listen and assess until we are fully in the midst of a situation. Additionally, when the moral demands of contemporary life are viewed in the light of any moral guidelines that can be offered, more questions are likely to be raised than answered. Thus, the church would benefit today from a greater focus on Christian moral education that enables people to develop the balance and perspective for practical, Christian moral discernment in everyday life.

Christian moral discernment involves identifying the movements of the Holy Spirit or the spirits of chaos and destruction regarding specific life choices in the here and now that have the potential to lead us toward or away from greater goodness and truth in our everyday actions and outlook on the world (Farnham et al. 1991; Futrell 1970). To foster Christian moral discernment we must first devote concentrated attention to understanding the dynamics of moral experience and the concerns that shape everyday moral living. Then, our focus must be truly and genuinely educational. It is not enough to provide resources that can be drawn upon when faced with a moral issue. Our focus must be on enabling; we might even say empowering, Christians to bring the resources of Christian faith traditions to bear in the here and now of everyday life. Overall, Christian moral education must 'enable,' not in a narrow and negative psychological sense, but with the purpose of helping people to recognise the possibilities and opportunities for living good and decent lives as Christians in our world today. It must 'empower' not in the sense of 'giving' power to people, but in the sense of providing opportunities to discuss practical issues and examples so that people will be better able to recognise the power they have to direct their lives in intentional and purposive ways as people of Christian faith.

Coping with Contemporary Confusions about Ethical Reflection

Morality is a code to guide conduct and character as persons interact with one another and the world of which we are all a part. However, sometimes our moral codes prove to be inadequate. We face new or especially complex issues that test our sense of what is right or morally good and who we are as moral persons. At such times our awareness of a moral issue is likely to lead into a process of ethical reflection. Ethical reflection involves thinking about, or the felt/affective apprehension of, the data of moral awareness, and questioning rather than accepting presumed standards of moral conduct and character. The goal of ethical reflection is to determine what should be done to resolve some present moral perplexity, or in cases of irreducible moral conflict or ambiguity to come to some understanding of how and why the moral issue arose. Ethical reflection may also enable us to articulate the qualities of character and virtues that persons, groups or even a whole society can and should embody if they are to embrace truly the moral code

they espouse. (My understanding of the dynamics of morality has been influenced significantly by the work of James Rest. See Rest 1983; 1986.)

Moral confusion can be unsettling, even unnerving. Ethical reflection strives to quench the fires of the turmoil caused by moral conflict and ambiguity. Today, however, our moral lives are sometimes torn asunder because of disputes about the nature of ethical reflection. In other words, ethical reflection, the process to which we turn for help in resolving moral uncertainty and conflict, has itself become a source of dispute and ambiguity.

In everyday life and philosophical reflection the dynamics of ethical reflection are sometimes seen as a process of critical distancing. From such a perspective, when faced with moral perplexity we should attempt to 'step back' from the immediacy of the present moment as we strive to affirm underlying values; come to a clearer sense of overarching moral law, duty or obligation; or gain a broader and more inclusive perspective, a 'bird's eye view' of the situation. From a Christian faith perspective, critical reflective distancing may enable us to step back from the specificity of our faith and moral convictions in order to be able to enter into dialogue with other Christians, secularists and people of other faith traditions as we strive to find common ground and reach moral consensus. However, even as we step back from our specific life situations, Christian faith may continue to shape the context out of which our critical reflective distancing takes place, and provide a moral self-understanding and religious intentionality that sustains our commitment to seek the morally good.

The Ideal Observer theories of moral philosopher Roderick Firth and his disciple, ethicist Arthur J. Dyck, provide examples of moral reflection as critical reflective distancing. They both argue that moral confusion arises when subjective factors cloud moral perception and moral data are not clearly recognised. They are interested in the characteristics of those who would prove to be ideal observers of moral data, observers who can distinguish accurately between 'really right' and only 'seemingly right' just as one might distinguish between 'really yellow' and 'seemingly yellow because of a particular lighting or background.' Firth and Dyck conclude that the ideal judge of moral data must be someone who can step back from the immediacy of a situation and be omniscient, omnipercipient, disinterested, and consistent. Dyck adds that Christians can think of 'the Ideal Observer analysis as a partial description of God.' He notes that Christians' love for God should include a 'commitment to imitate and emulate the qualities of an ideal moral judge' (Firth 1952; Dyck 1968; 1978; 1981; quote from Dyck 1968, 538).

Models of ethical reflection as critical reflective distancing have come under intense attack in our postmodern age. Today people often have a heightened awareness of the historical situatedness of all human knowing and doing. Attempts to appear disinterested and critically detached are often seen as either masking a will to dominate and control or as based on self-deceptions. Those who claim the objectivity of critical reflective distance are often greeted with suspicion and the belief that they must be trying to force their moral interests and agenda on others by adopting a pose of being above all particular interests. Or, they are seen as

sincere but misguided and perhaps even dangerous people who strive to force their moral perspective on others without realising that they cannot achieve complete, disinterested objectivity because they are blind to the ways their own perspectives are inevitably grounded in some specific time and place.

Various models have been proposed to replace understandings of ethical reflection as critical reflective distancing. Many, if not most, of these models incorporate a sense of moral reflection as involving what can be called narrative and relational skills. From a narrative and relational perspective, we should strive to overcome moral conflicts and confusions not by 'stepping back from' but by 'stepping into' situations. That is, when we face moral uncertainty we should look carefully at who we are as moral persons and community and ask how we want the moral story of our personal and communal lives to continue to unfold as we take the next step in our journey of life. From this perspective, we must also consider in our moral reflecting how we can maintain or strengthen the shared moral ideals and commitments that are the heart of our relationships with other people. From a Christian perspective, we can think of this model of moral reflection in terms of what Vincent MacNamara calls 'Christian rationality,' that is, moral reflection that is grounded in and strives to remain faithful to an understanding of the Christian narrative or story of faith and that nurtures our relationship with God and others (MacNamara 1985, 205–206).

The narrative ethic of Alasdair MacIntyre and the ethic of care of Nel Noddings provide examples of moral reflection as involving narrative and relational skills. Although there are significant differences between moral philosophers MacIntyre and Noddings, they envision the dynamics of moral experience in parallel and analogous ways. They begin with what can be called an understanding of the 'given' aspect of moral experience. More fully, MacIntyre accepts as a given fact of moral experience that it is our nature as human beings to have a narrative or story to give our lives coherence. Analogously, for Noddings the given element of moral experience is a universally accessible caring attitude grounded in the memory of the specific caring relationships that have sustained our lives (MacIntyre 1981; Noddings 1984).

MacIntyre and Noddings both reject the idea that moral reflection should be a stepping back from the given aspect of moral experience to an objective or universal moral standpoint. MacIntyre argues that human beings come to understand the moral life not by focusing on the narrative nature of human existence, but by attending carefully to the traditions and social practices of our specific, narrative life contexts. Similarly, Noddings argues that universal love is an illusion. She claims that we learn to practice morality as an 'active virtue' by first being in relationships with other people in which we experience the concrete realities of loving and caring and being loved and cared for. For MacIntyre and Noddings moral reflection is a skill that can enable us to face moral conflict or ambiguity in our relationships with other people and then move forward from where we are as we take the next step in the moral journey of our lives. (See MacIntyre 1981; 1992; Noddings 1984, especially 79–87.)

In addition to models of ethical reflection as critical reflective distancing and narrative and relational skills, there have been many attempts to combine these two models or find a middle ground between them. A well-known example of such middle-way models is found in philosopher John Rawls's theory of justice as fairness. Rawls argues that we need to critically distance ourselves from our particular standpoints in life during the process of ethical reflection if we are to overcome personal bias and achieve a measure of fairness. However, in recognising the situatedness of all human activity, Rawls contends that we can never reach a purely objective, disinterested moral viewpoint. Rather, Rawls calls us to recognise that for those of us living in modern, Western democratic polities, ethical reflection at its best can only help us to clarify and come to consensus about the underlying and shared moral values that we already hold in common and must affirm if we are to move forward in addressing public, moral issues (Rawls 1971; 1985; 1993).

Within academic circles today there are often fierce debates about the nature of moral reflection. Not only are those who advance an understanding of moral reflection as critical reflective distancing locked in debate with those who champion some model of moral reflection as narrative and relational skill, there are intense debates within each of these camps as well. For instance, I have heard academics influenced by MacIntyre stress the importance of narrative as a guiding category for moral reflection and suggest that too great a focus on relationships can lead to a negative sentimentality, while some advocates of an ethic of care have argued that MacIntyre's focus can be either too individualistic or supportive of the social status quo, and that narrative ethicists need to show greater recognition of the transformative power of relationships. Middle-way positions, including the theory put forth by Rawls, are usually attacked by both sides in the debate. Overall, while the academic debates about the nature of moral reflection can become acrimonious, they have advanced our understanding of the dynamics of moral experience.

Debates at the pastoral level of church life that hinge upon differing understandings of moral reflection have also often been intense. Yet, they often lead to a diminished sense of morality or have been destructively divisive. In reacting against the greater plurality and ambiguity of our contemporary age and the loss of clear paradigms for moral reflection, some Christians have turned away from moral reflection altogether and retreated into what Gerald Arbuckle has called 'pro-order' movements or stances (Arbuckle 2004, 163). Pro-order Christians attempt to bring order to contemporary moral confusion and circumvent the need for moral reflection by viewing all moral issues in the light of clearly defined moral convictions about what are judged to be key or litmus test moral issues. For instance, in the United States today there is an influential pro-order, conservative Christian movement drawing from both Protestant and Catholic faith communities that strives to overcome moral ambiguity not through moral reflection but by looking at all moral issues in the light of an absolute or nearly absolute anti-abortion stance, a narrowly defined sense of family values, and a cautionary approach to the development and use of new technologies, especially in health care. The pro-order stance may provide a sense of security, but because it is a non-dialogical stance it tends

to lead its advocates to separate themselves from public moral discourse with those with whom they disagree, and its adherents tend not to be critically self-reflective. Many who adopt a pro-order Christian stance tend to focus, sometimes exclusively, on the church as a counter-cultural and prophetic voice called to stand against the immorality of the world.

At the other end of the spectrum, there are various degrees of cynicism and skepticism about the possibilities for moral reflection and discussion. Some people today regard most moral proposals as attempts by a person or group to exert power over others. They tend to see pro-order movements in particular as attempting to impose the moral perspectives of specific Christian communities on all members of society by claiming that they are based upon universal moral norms and values. Others become discouraged about the possibilities for creating meaningful public forums for moral reflection among those who adopt differing models of moral reflection and action.

Still, there are increasing numbers of Christians who adopt a middle way between the two extremes mentioned above. On the one hand, they are often less concerned with overarching conceptual and explanatory frameworks of knowing and less likely to strive for a perspective of critical reflective distance that will guarantee moral objectivity. On the other hand, they resist the temptations of cynicism and despair. They continue to hold the conviction that morality is an important part of human life and that we can hope to find a sufficient measure of objective clarity in our everyday moral reflecting and acting. They are often, for the most part, groping their way forward as they strive to make meaningful and morally responsible connections between Christian faith and everyday life.

The church would benefit today from a greater focus on Christian moral education that addresses confusions about the nature of moral reflection. First, we must affirm the value and importance of moral reflection. We need to show how we must be morally reflective people in order to be able to respond to the complexities of contemporary life and to enter into dialogue with people of diverse backgrounds and moral perspectives in addressing pressing social and public issues. We must find ways to support people in resisting pressures to adopt a non-reflective pro-order moral stance or give into tendencies toward moral cynicism and despair.

Second, in discussing the dynamics of moral reflection in pastoral educational settings, we can begin by stressing the importance of both critical reflective distancing and narrative/relational skills. Consider as an example the story of Roberta told at the beginning of this chapter. On the one hand, Roberta needs to step back from her work situation and her friendship with her colleague, Tom. She will benefit by trying to gain a broader, more inclusive perspective so that she will be able to discern what the central moral questions in the situation truly are. On the other hand, Roberta also needs to step into the situation and reflect upon her current relationship with Tom and how she might see this relationship continuing to develop. In stepping into the situation she may also want to consider how her response to Tom could affect all of her work relationships. Overall, while there are a number of philosophical questions that can be raised about critical reflective

distancing and narrative/relational skills, academic inquiry has demonstrated the value of both, and their value can be further demonstrated in concrete pastoral settings.

Pastorally, knowing when and how to use critical reflective distancing and narrative/relational skills and how to relate the two is not something that can be pre-programmed. Again, it is something that requires practical, pastoral moral judgment and discernment. Thus, the analysis of this section affirms the importance of pastoral, Christian moral education. We can now add that the focus in Christian moral education must include enabling or empowering Christians to understand and make use of both critical reflective distancing and narrative/relational skills as dimensions of ethical reflection while at the same time affirming the value of ethical reflection in our lives.

Concluding Reflection

This essay has presented a pastorally reflective argument for the benefits of a more intentional focus on Christian moral education that helps to enable people to understand and respond to the moral demands of contemporary life. Based upon this analysis I suggest that there be three primary dimensions to Christian moral education in the church today. First, Christian moral education will help Christians relate their faith convictions in meaningful and morally responsible ways to everyday life when it is focused upon the discussion of concrete cases like those of Rick and Roberta and Faustin Pipal. Morality is a practical art. The embodiment of moral goodness and virtue, wise moral decisions and moral faults are all illustrated best by concrete examples.

Second, religious educators can foster a greater understanding of the dynamics of morality and encourage the development of intentional, responsible moral agency by highlighting significant contemporary moral issues. Within our faced-paced, ambiguous and increasingly complex postmodern times, there are a number of moral concerns that are frequently raised. I have discussed two of these issues in this essay, the problem of the specificity of Christian convictions in a world where not everyone is a Christian, and contemporary confusions about the nature of moral reflection. By discussing concrete cases in which these issues arise, Christians can prepare to address the issues if they come up in their own lives, and can develop the qualities and virtues that will enable them to live as people of moral integrity and character in their personal and communal lives today. Moreover, beyond the two issues discussed here, I suggest that Christians would benefit from discussing cases that address the increasing moral pluralism at the most fundamental levels of moral understanding and action today, and cases that explore limit situations, that is, situations in which Christians need to move beyond dialogue to confrontation with immorality and moral evil. The latter is important today because it is more difficult to determine when we encounter limit situations and how we can faithfully and effectively cope with them as Christians as the world becomes more complex.

Third, educators involved in Christian moral formation need to be in dialogue with the academic resources on morality and Christian religious education and be able to draw from these resources as they explore issues of Christian moral responsibility in the world. On the one hand, the studies on morality in philosophy, theology, psychology and other disciplines can provide a greater understanding of the dynamics of moral experience and provide a theoretical foundation for the discussion of moral issues arising in specific situations. On the other hand, placing Christian moral education within the broader context of Christian religious education can help to ensure that our conception of the moral life as Christians is seen in relation to our understanding and worship of God. It can help us to avoid the temptation to reduce faith to ethics and Jesus to a moral teacher. However, if Christian moral education is to be of the greatest possible benefit to the church today, we must be certain in drawing upon academic resources, to maintain a pastoral focus, a focus on the moral demands of contemporary life. Our efforts must be directed toward enabling Christians to be more fully open to welcoming and working to bring about the fuller realization of God's Reign, God's Peace and Justice, as we address the complexities and ambiguities of the postmodern age.

THE INTEGRAL PHILOSOPHY OF KEN WILBER AND RELIGIOUS EDUCATION

Anta Filipšone

Systematic and Practical Theology, University of Latvia, Riga, Latvia

Introduction

This essay is an attempt to bring to the attention of religious and spiritual educators the work of a contemporary Northern American philosopher Ken Wilber, whose most recent writings include *Integral Psychology* (Wilber, 1999a), *Sex, Ecology, Spirituality* (Wilber, 2000b), *The Marriage of Sense and Soul* (Wilber, 2001a), and *A Theory of Everything* (Wilber, 2001b). Having initially started as a transpersonal psychologist, over the years Wilber has considerably expanded the scope of his interests. Today he is known as the founder, leader and most prominent representative of the integral approach to philosophy, cultural studies, psychology, and spirituality (see *Ken Wilber: Thought as Passion* [Visser, F. 2003] also websites www.wilber.shambhala.com, www.integralinstitute.com, www.integralnaked.org).

Due to the limited space it is not possible to provide here a complete overview of Wilber's work or to explore all the potential consequences of his views for the theory and practice of religious education. My aim is more modest: to offer the shortest possible introduction into the heart of Wilber's theory—the four quadrant framework—and to initiate a discussion on the possibility of its application in the field of religious education.

The Integral Approach

There are several reasons why Wilber describes his philosophy as integral. Firstly, Wilber wants to provide an integral or 'holistic' map of the world. In the Introduction to his magnum opus *Sex, Ecology, Spirituality* Wilber writes that his main aim is to offer 'a holistic philosophy for a holistic Kosmos: a world philosophy, an integral philosophy,' which would suggest that 'the world really is one, undivided, whole, and related to itself in every way' (Wilber, 2000a, p. x).

Secondly, Wilber believes that with the help of his main heuristic device—the four quadrant framework—he has integrated the enduring insights of premodern, modern, and postmodern worldviews. An essential feature of this synthesis is a proposal at integration of science and religion or, to borrow the title from one of his books, at ‘the marriage of sense and soul’ (Wilber, 2001a).

Thirdly, Wilber’s approach is integral in that it ‘attempts to honor and include as much research as possible from the largest number of disciplines in a coherent fashion’ (2001b, 2). This also includes the integration of the Eastern and Western approaches to philosophy, psychology and spirituality. Jack Crittenden describes the scope of Wilber’s synthesis as follows:

Wilber has provided a coherent and consistent vision that seamlessly weaved together truth-claims from such fields as physics and biology; the ecosciences; chaos theory and the systems sciences; medicine, neurophysiology and biochemistry; art, poetry, and aesthetics in general; developmental psychology and a spectrum of psychotherapeutic endeavors, from Freud to Jung to Piaget; Great Chain theorists from Plato and Plotinus in the West to Shankara and Nagarjuna in the East; the modernists from Descartes to Locke to Kant; the Idealists from Shelling to Hegel; the postmodernists from Foucault and Derrida to Taylor and Habermas; the major hermeneutic tradition, from Dilthey to Heidegger to Gadamer; the social systems theorists from Marx and Comte to Parsons and Luhmann; the contemplative and mystical schools of the great meditative traditions, East and West, in the world’s major religious traditions. All this is just a sampling (Crittenden, 1997, pp. viii–ix).

Fourthly, Wilber is interested in integration of the scientific endeavor with two interrelated kinds of praxis—political and spiritual, for he is well aware that ‘Even if we possessed the perfect integral map of the Kosmos, a map that was completely all-inclusive and unerringly holistic, that map itself would not transform people’ (Wilber, 2001b, p. 55).

And finally, for Wilber the term ‘integral’ also implies a critical stance toward ‘those approaches that are, by comparison, partial, narrow, shallow, less encompassing, less integrative’ (Wilber, 2001b, p. 2). This critique manifests both in the content of Wilber’s work and at times in its polemical tone. Even though Wilber (2001b) repeats that his work should not be regarded ‘a fixed or final theory’ (p. xiii), because ‘the holistic quest is an ever-receding dream, a horizon that constantly retreats as we approach it’ (p. xii), nevertheless he also believes that:

A little bit of wholeness is better than none at all, and integral vision offers considerably more wholeness than the slice-and-dice alternatives. We can be more whole, or less whole; more fragmented or less fragmented; more alienated or less alienated; and integral vision invites us to be a little more whole, a little less fragmented, in our work, our lives, our destiny (ibid).

In the following sections I will focus on two aspects of Wilber's integral philosophy—the integration of the essential features of premodernity, modernity, and postmodernity, and the integration of science and religion. The last section will be devoted to a discussion of the possible contribution of the integral approach to contemporary religious education, using as the main partner of conversation from the religious education side the critical model of religious and spiritual education developed by Andrew Wright in Great Britain.

Integration of Premodernity, Modernity and Postmodernity

The Premodern Heritage—The Great Hierarchy

The cornerstone of Wilber's integral philosophy is the understanding of reality as the Great Hierarchy of Being and Knowing (Figure 1), i.e. as a soft, nested hierarchy where each level is a whole-part (holon) simultaneously enveloping the predecessor and being enveloped by the successor: 'The Kosmos is a series of nests within nests within nests indefinitely, expressing greater and greater holistic embrace—holarchies of holons everywhere' (Wilber, 2001b, p. 40).

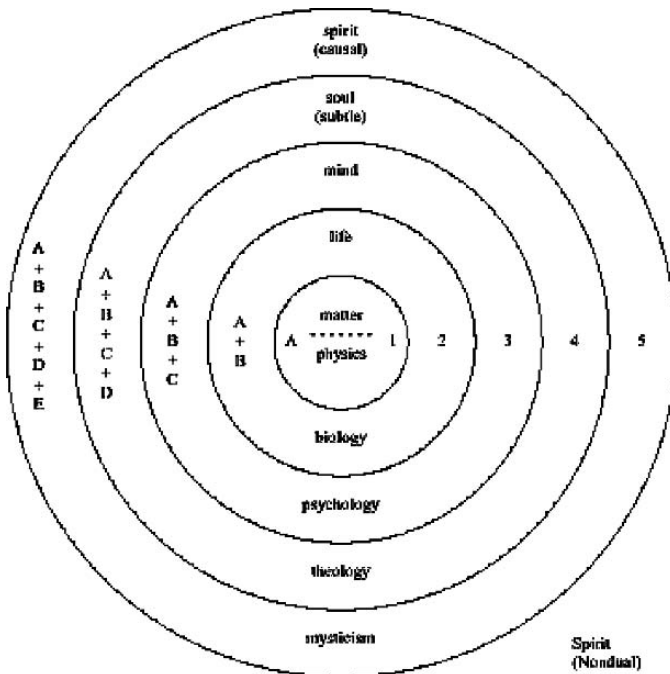

Figure 1. The Great Nest of Being and Knowing

The Great Hierarchy is, of course, a modified version of the Great Chain of Being and Knowing, which, according to Wilber, is the essential heritage of premodernity (cf. Lovejoy, 1964; Smith, 1976). Being aware of numerous criticisms of the hierarchical view of reality implied in the Great Nest, Wilber nevertheless insists that the notion of hierarchy is crucial for the understanding of wholeness, for ‘unless you organise the parts into a larger whole whose glue is a principle higher or deeper than the parts possess alone—unless you do that, then you have heaps, not wholes’ (Wilber, 2000b, p. 24). At the same time for Wilber, the Great Nest is not a collection of ‘permanently fixed and unchanging essences’ (Wilber, 1999a, p. 443), but rather ‘a great *morphogenetic field* that provides a *developmental space* in which human potentials can unfold’ (Wilber, 1999a, p. 459).

Another important feature of the Great Hierarchy is its evolutionary unfolding ‘toward increasing complexity and awareness’ (Wilber, 1999e, p. 334). As for Hegel, for Wilber evolution is an essentially spiritual process. In Wilber’s view, the Spirit is simultaneously the highest level of the Hierarchy and the Ground of each level:

The Absolute is both the highest state of being and the ground of all being; it is both the goal of evolution and the ground of evolution; the highest stage of development and the reality or suchness of *all* stages of development; the highest of all conditions and the Condition of all conditions; the highest rung in the ladder *and* the wood out of which the entire ladder is made. Anything less than that *paradox* generates either pantheistic reductionism, on the one hand, or wild and radical transcendentalism, on the other (Wilber, 1999e, p. 418).

The major problem, though, with the pre-modern way of thinking is its failure to differentiate the cultural values spheres of art, morals, and science (Wilber, 2001b, p. 69). Consequently, the Romantic U-turn back to the pre-modern times in search for genuine holism is mistaken, for premodernity does not presuppose a holistic integration of previously differentiated spheres, but ‘simply a fusion of spheres that robbed each of its autonomy and dignity’ (Wilber, 2001a, p. 48). In Wilber’s view, the road toward a genuinely holistic paradigm lies forward to differentiation and subsequent integration of the Big Three rather than back to the state of their fusion. In other words, the Great Nest has to be modernised and postmodernised due to a sincere acknowledgment of the need ‘to recognise the importance of cultural background, relativistic surface structures and contexts, correlations with modern scientific discoveries, sensitivity to minorities..., the importance of pluralistic voices and so on’ (Wilber, 1999a, p. 576).

The Modern Heritage—The Differentiation of the Values Spheres

Wilber proposes to modernise the Great Nest by differentiating *within it* the ‘Big Three’ cultural spheres of the Good, the Beautiful, and the True (or culture, self, and nature; or We, I, and It) and filling in the traditional structure of matter, life, mind,

soul, and spirit with the findings of contemporary sciences of evolutionary biology, psychology, sociology and cultural studies. For convenience, he extended the three spheres to four by dividing the sphere of the True/nature/It into two parts—It and Its, where It stands for singular organisms, Its—for systems. Thus Wilber arrived at the basic structure of his four quadrant framework (Figure 2)—a map of the psychological (Upper Left), physical and biological (Upper Right), ecological and social (Lower Right), and cultural (Lower Left) aspects of the evolution, where each aspect correlates and actually co-evolves with all the others, ‘for the simple reason that you cannot have an inside without an outside, or a plural without a singular’ (Wilber, 2001a, p. 73)

The UR quadrant of the framework refers to the scientific account of the individual components of the universe: atoms, molecules, cells, and multicellular organisms. The LR quadrant refers to the scientific account of systems of individual holons. Together these two quadrants (UR+LR) comprise objective exteriors of

Figure 2. The Four Quadrant Framework

both individuals and systems: the empirical world of the objective nature, of science and technology, and of propositional truth. In short, these quadrants stand for the third-person perspective and the it-language of empirical science.

The UL quadrant is a holarchy of development of interior awareness in individuals. It refers to consciousness, subjectivity, and self. This quadrant stands for the first-person perspective and the I-language. The LL quadrant refers, then, to the second person perspective and the We-language: worldviews, ethics, culture, i.e. to the inter-subjective forms of awareness that provide the context for development and well-being of individual awareness. Together these two quadrants (UL+LL) comprise subjective interiors of both individuals and systems (Wilber, 2001a, chapter 5; 2001b, chapter 3; 1999a, chapter 5; 2000b, chapter 4).

Of course, the four quadrant framework as presented in Figure 2 is a schematic oversimplification of very complex issues. In each quadrant, where we see only one line of development, there should be in reality many of them. Thus, for example, in the book *Integral Psychology* (Wilber, 1999a) Wilber discusses the full 'integral cartography' of the UL quadrant of interior individual development and argues that it has to include the following elements:

- Numerous *streams* of development that unfold from *wave* to *wave*.
- Multiple *states* of consciousness, including natural as well as altered and meditative states.
- Numerous *types* of consciousness, including gender types, personality types, etc.
- The impact of *organic* (UR) factors
- The impact of *social* (LR) factors
- The impact of *cultural* (LL) factors
- The importance of *the self* as the navigator and the centre of gravity acting to bind the multiple waves, streams, states, and quadrants into a unified organization.

Furthermore, a full cartography of this quadrant also includes the four spiritual or transpersonal waves that follow the rational or personal waves studied by mainstream psychology. These higher waves, as delineated by Eastern spiritual systems, are the psychic (the nature mysticism), the subtle (the deity mysticism), the causal (the formless mysticism), and the nondual (the nondual mysticism). Wilber maintains that these stages can either emerge as permanent structures following the completion of personal development, or can be peak experienced at any of the previous stages (Wilber, 1999a, pp. 444–448).

In a similar way, there can be produced full cartographies of other quadrants. It must be stressed, though, that the integral view *does not* presuppose that the overall development even within one quadrant, let alone the development across all quadrants, follows linear or sequential pattern: 'many of the streams develop at their own rate, with their own dynamic, in their own way. A person can be at a relatively high level of development in some streams, medium in others, and low in still others. Overall development, in other words, can be quite uneven' (Wilber, 2001b, p. 44).

The Contribution of Postmodernity—Constructivism, Contextualism, Integral-Aperspectivism

In addition to the synthesis of the essential insights of premodernity and modernity, the four quadrant framework also allows for the integration of what Wilber regards to be the three moments of truth in postmodernism, namely:

- constructivism—the idea that ‘reality is not in all ways pregiven, but in some significant ways is a construction, an interpretation’ (Wilber, 1999a, p. 595). In the context of the four quadrant framework it simply means that all holons have an exterior surface that can be measured (Right Hand quadrants) and an interior depth that has to be interpreted (Left Hand quadrants).
- contextualism—the idea that ‘meaning is context-dependent, and contexts are boundless’ (Wilber, 1999a, p. 595). According to Wilber, this is another way of saying that ‘reality is composed of holons within holons indefinitely, with no discernible bottom or top’ (Wilber, 1999a, p. 598).
- integral-aperspectivism—acknowledgement of the need for a multiperspective or, in integral terms, all-level, all-quadrant (AQAL), approach to reality (Wilber, 2001a, p. 131).

Wilber develops the last point in two directions: scientific and practical. In the context of scientific research, Wilber attributes much of the fragmentation of sciences to the fact that too ‘many scholars, specialising in only one quadrant, deny importance or even existence to the others’ (Wilber, 2001a, p. 73). Hence the first major task of the integral philosophy is to harmonise the sciences of all levels in each quadrant and develop AQAL approaches that would ‘investigate the various phenomena in each of the four quadrants—subjective states, objective behavior, intersubjective structures, and interobjective systems—and correlate each with the others, without trying to reduce them to the others’ (Wilber, 2001a, p. 207).

However, as already mentioned in the beginning, Wilber is well aware that it is not enough just to construct a more comprehensive scientific map of reality—the integral theory has to put into integral practice. Hence the second, practical task of the integral philosophy—to propose better ways to *change the mapmakers*, i.e. to develop AQAL approaches to solving practical problems in life—from political to economic, to social, to ecological, to educational, to spiritual, etc. For Wilber this means that the scientific enlightenment or integral thinking has to marry the political enlightenment or integral social action and the spiritual enlightenment or integral spiritual practice.

The integral politics, according to Wilber, would have to follow *The Prime Directive*, which demands to ensure the health of the entire spiral, not preferential treatment for any one level or stream or realm (Wilber, 2001b, p. 56). The Directive reflects one of the basic ideas of the integral philosophy: ‘each level of consciousness and wave of existence—is, in its healthy form, *an absolutely necessary and desirable element* of the overall spiral’ (ibid). In the book *A Theory of Everything* Wilber provides specific examples of how the Prime Directive can and is already being applied to politics, business, medicine, ecology, etc. (Wilber, 2001b, chapter 5).

However, one cannot be engaged effectively in integrally informed professional and social practice unless one possesses an integral consciousness. To foster the emergence of the integral consciousness is the task of integral spirituality, which is in short described by Wilber as ‘exercising physical, emotional, mental and spiritual waves in self, culture, and nature’ (Wilber, 2001b, p. 138). While the program of integral spirituality certainly includes and encourages specific spiritual activities such as various kinds of meditation, they are regarded insufficient unless complemented by physical (UR), emotional and mental (UL), ecological and social (LR), and intersubjective and cultural (LL) activities—all united by a conviction that ‘The more categories engaged, the more effective they all become’ (Wilber, 1999a, p. 546).

With this brief overview of the four quadrant framework in the background we can now turn to Wilber’s views on religion and then draw some consequences for religious education.

Integration of Science and Religion

The integration of science and religion is a major theme in all of Wilber’s writings and also the particular topic of the book *The Marriage of Sense and Soul* (Wilber, 2001a). In fact, reconciliation of science and religion is one of the most important functions of the four quadrant framework, for according to Wilber, the main challenge faced by contemporary religion is precisely to ‘integrate the Big Three value spheres of self, culture, and nature, not merely attempt to dedifferentiate them in a premodern slide or deconstruct them in a postmodern blast’ (Wilber, 2001a, p. 139). In other words, for Wilber the main problem is to show how religion can ‘stand up to scientific authority’ (ibid). And the first step Wilber proposes to take toward a solution is to distinguish between several meanings of both terms—‘religion’ and ‘science,’ and to decide what exactly can be integrated.

Speaking of religion, Wilber does not differentiate sharply between religion and spirituality, as it is fashionable today. Instead he prefers to speak of narrow, or shallow, or translative, or legitimate, or horizontal religion/spirituality on the one hand, and of broad, or deep, or transformative, or authentic, or vertical religion/spirituality, on the other hand:

Narrow religion, then, is simply those beliefs, practices, customs, experiences, and traditions that help one to translate and embrace the worldview of any given wave; whereas deep religion involves those practices, techniques, and traditions that help one to transform to the higher, transrational, transpersonal waves. (Wilber, 2001b, pp. 159–160, Note 17)

Most premodern religious traditions offer both, yet Wilber focuses primarily on the second, vertical dimension of religion, since in his opinion it promises most in regard to reconciliation with science.

Similarly, in the case of science, Wilber also distinguishes between the narrow or Right Hand sciences, which are based on the exterior, physical, sensorimotor world,

and the broad or Left-Hand sciences, which study subjective and inter-subjective aspects of human consciousness. Obviously these different realms—physical and mental—call for different specific methodologies of investigation. Nevertheless, Wilber maintains that what unites all good science, whether narrow or broad, is the general scientific methodology consisting of three basic strands:

- A practical injunction or exemplar
- An apprehension, illumination, or experience
- Communal checking (either rejection or confirmation) (Wilber, 2001b, p. 75)

It is on the basis of this general methodology that Wilber sees the possibility of reconciliation between deep religion/spirituality and science. If the same basic methodological strands are applied to the sensorimotor and mental realms, why not apply them, asks Wilber, to the spiritual realm either? Why not to investigate scientifically the psychic, the subtle, and the causal waves of existence? After all, is it not what is already happening in deep religion/spirituality? Wilber's answer to these questions is positive, for in his opinion, the crucial difference between the narrow and the broad religion is that while the former is concerned with beliefs, the latter is primarily grounded in certain practices or *injunctions*:

And where the exemplar in physical sciences might be a telescope, and in the human sciences might be linguistic interpretation, in the spiritual sciences the exemplar, the injunction, the paradigm, the practice is: meditation or contemplation. It too has its injunctions, its illuminations, and its confirmations, all of which are generally repeatable, verifiable or falsifiable—and all of which therefore constitute a perfectly valid mode of knowledge acquisition (Wilber, 1999d, p. 143).

Thus, deep or broad religion can be viewed in part as a spiritual science, which 'involves the *direct investigation of the experiential evidence disclosed in the higher stages of consciousness development*' (Wilber, 2001b, p. 77). Only in part, because deep religion/spirituality also involves the art and morals of the higher realms, with their own specific methodologies and validity claims (Wilber, 2001b, pp. 156–157, Note 15). This way, Wilber believes, the major obstacles to the integration of science and religion are lifted, and 'The contemplative and phenomenological sciences (the broad sciences of interiors) can thus join hands with *good science* for direct experiential data in the Upper Left and with *narrow science* for correlative data in the Upper Right' (Wilber, 2001b, p. 78).

In other words, what Wilber asks of science and the modern worldview for the sake of reconciliation with religion/spirituality is basically to expand its scope 'from narrow empiricism (sensory experience only) to broad empiricism (direct experience in general)' (Wilber, 2001a, p. 161). And what is asked from the other side—any premodern religious tradition—is that in the conversation with science it primarily 'emphasises its heart and soul and essence; namely, direct mystical experience and transcendental consciousness' (Wilber, 2001a, p. 167).

At the same time, Wilber stresses that he is not advocating a new form of universal homogenised spirituality: 'The Great Chain is simply the skeleton of any individual's approach to the Divine, and on that skeleton each individual, and each religion, will bring appropriate flesh and bones and guts and glory' (Wilber, 2001a, p. 204).

Implications for Religious Education

Wilber himself does not discuss the topic of religious education, yet even on the basis of this brief introduction, some conclusions can be drawn. Thus, Wilber's distinction between the translative and transformative religion obviously leads to the distinction between translative and transformative forms of religious education. While the first is concerned with learning to exercise the eye of the flesh via empirical investigation of the phenomenon of religion and the eye of the mind via rational inquiry into the issue of ultimate truth, the second aims at the transformation of consciousness to the transrational waves of being and knowing via training the eye of the spirit in meditation and contemplation. None of these eyes can be reduced to others, and so cannot be different forms of religious education—studies in sociology of religion cannot replace studies in philosophy and theology, and neither sociological studies, nor philosophical and theological studies, can replace contemplative education—and vice versa (cf. Berryman, 1992). Wilber writes, 'it is my feeling that the most important thing a comprehensive or integral paradigm can do is try to avoid the category errors: confusing the eye of flesh with the eye of mind with the eye of contemplation' (Wilber, 1999e, p. 185).

One of such widespread category errors, according to Wilber, is a tendency to confuse the emotional aspect of the eye of the flesh with the eye of the spirit and consequently to elevate emotion above reason in religion. Wilber attributes this category error to uncritical compliance with the Romantic philosophy and particularly to what he calls *pre/trans fallacy*—the characteristic Romantic confusion of emotional prerationality with transrationality (Wilber, 1999e, chapter 7). Since the integral philosophy associates authentic religion with the postrational rather than prerational waves of development, it does not view reason per se as a threat to religion and spirituality. For Wilber, reason 'is a *pro-authentic-religious* trend by virtue of being transmythic or post-mythic and *on its way* to ...higher levels of structural adaptation' (Wilber, 1999b, p. 87). Thus, in the integral perspective, 'Transrationality, unlike prerationality, happily incorporates the rational perspective, and then adds its own defining characteristics; it is thus *never* antireason, but, in a friendly way, transreason' (Wilber, 2001a, p. 92). Consequently, the overall task of religious education should certainly include fostering the intellectual development in students, for only after 'reason has emerged and consolidated, consciousness can continue to grow and develop and evolve, moving into transrational, transpersonal, and supraindividual modes of awareness' (Wilber, *ibid*).

Hence, integrally informed religious educators are likely to support the legitimate concern of contemporary critical educators, such as Wright (1998; 2000a;

2000b; 2004), about the undue stress on 'spiritual emotivism detached from critical reflection' (Wright, 2000a, p. 76) in certain forms of contemporary religious and spiritual education based on the Romantic and postmodern metanarratives. In fact, it can be argued that critical forms of religious education, such as the model proposed by Wright, are most appropriate in the period of emergence and consolidation of the rational waves, i.e., in the years of life associated with primary, secondary and even tertiary education. Moreover, a critical stance does not lose its importance even with the emergence of transrational waves. To quote Wilber,

A highly critical, occasionally skeptical, and sometimes even polemical attitude must be our constant companion on the road to any sort of truth. The commodity most lacking in spiritual circles seems to be, indeed, a healthy skepticism, possibly because it is confused with lack of faith, a stance which, if understandable, is deeply misguided (Wilber, 1999c, p. 4).

Yet from the integral perspective, critical religious education per se is not sufficiently spiritually transformative. Even though it can indeed help to cultivate religious literacy, it is too much to expect, as Wright does, that it could 'expose children to the realm of the transcendent' (Wright, 2004, p. 212) and lead to 'the possibility of viewing our mundane and all-too-human comedy of errors *sub specie aeternitatis*—as part of potentially profound *divina commedia*' (Wright, 2004, p. 209). Following Kant, Wilber stresses that rational discussion by itself will not and cannot lead to the exposure to the realm of the transcendent, because even holistic reason (vision-logic) 'cannot grasp the essence of absolute reality, and when it tries, it generates only dualistic incompatibilities' (Wilber, 1999e, p. 169). What reason can do is only 'strip Spirit of its infantile and childish associations, parental fixations, wish fulfillments, dependency yearnings, and symbiotic gratifications' (Wilber, 1999b, p. 87). For Wilber, the ultimate truth is available as public knowledge only through direct transrational realisation to those who possess a trained spiritual eye:

The knowledge of God is as public to the contemplative eye as is geometry to the mental eye and rainfall to the physical eye. And a trained contemplative eye can *prove* the existence of God with exactly same certainty and the same public nature as the eye of flesh can prove the existence of rocks (Wilber, 1999e, p. 184).

Therefore, from the integral perspective, becoming religiously literate is only the first, though important enough, step toward spiritual transformation and acquisition of genuine religious knowledge.

Finally, within the confines of rational inquiry into religious matters, Wilber, following Habermas (1976), insists that a truly critical perspective toward different worldviews demands not only a shift from quantitative to qualitative pluralism as Wright demands (2000b, p. 177), but also a combination of qualitative pluralism in the LL quadrant with *developmental structuralism*, for the latter 'seems to give us

that universal or quasi-universal critical dimension or external corrective apparently lacking in merely hermeneutic, phenomenological, or symbolic realist approaches' (Wilber, 1999b, p. 41). In other words, even critical forms of religious education would be more effective in their attempts 'to do justice to the horizon of religion' (Wright, 2000b, p. 177) as well as 'to do justice to the horizon of the pupil' (ibid), if they are plugged into the four quadrant framework. The major benefits of employing the framework in critical and other forms of religious education would include the following:

- The framework allows to define more precisely the term 'holistic' as 'all-quadrant, all-level.'
- The framework functions as an indexing system for sciences, worldviews, philosophies, religions, spiritualities, and educational approaches, with the following parameters:
 - the developmental level of the subjects producing the worldview or theory
 - the level of reality (or object), at which the worldview or theory is directed
 - the types of orientations within levels
 - the quadrants (perspectives) mostly engaged in and the lines within quadrants particularly stressed
 - the altered states that may have had an impact on the subjects producing the worldview or theory (Wilber, 2001b, p. 108).
- The holonic analysis performed on the basis of this indexing system can help to locate each worldview and theory and appreciate their importance, to understand the way different worldviews and theories relate to each other, to unravel the multidimensional nature of ideological conflicts, and find ways of fostering communication, constructive critique and collaboration among conflicting parties.
- The framework translates into the Prime Directive as the main ethical imperative for treatment of persons as well as worldviews, religions, and spiritualities in pedagogic practice: to ensure the health of the entire spiral, not preferential treatment for any one level or stream or realm.

Conclusion

Even though in this essay the integral philosophy of Ken Wilber is confronted with only one model of religious education, clearly the conversation can and should expand much further. Moreover, the four quadrant framework can become a common metatheoretical foundation and communicative framework to a number of various educational models and approaches. Some of them will incorporate the entire framework, others only the conventional part of it. Yet in any case, these approaches will probably share more than a map. More important, the authors of these integrally informed approaches are likely to share the basic attitude to mapmaking, which underlies the entire integral philosophy of Ken Wilber:

Building on the rich diversity offered by pluralistic relativism, we need to take the next step and weave those many strands into a holonic spiral of unifying connections, an interwoven Kosmos of mutual intermeshing. We need, in short, to move from pluralistic relativism to universal integralism—we need to keep trying to find One-in-the-Many that is the form of the Kosmos itself (Wilber, 2001b, p. 112).

DIALOGUE TO TRUTH IN BELL HOOKS AND JANE ROLAND MARTIN

Namulundah Florence

School of Education, Brooklyn College

Introduction

Exasperated by Jesus' responses during the interrogation at the Sanhedrin Pilate asked: 'What is truth?' (John 18:28–38). It is a question both theists and secular humanists still grapple with given cultural diversity and subsequent need for legitimacy of policies and practices across the globe. Academies are committed to the inquiry and transmission of 'truth'. Contrary to the Carthage born theologian Tertullian's (ca 160–225) assessment, Jerusalem and Athens are overlapping frames of reference (Groome, 1993). Groome maintains that a wisdom epistemology involves commitment to the whole truth: cognitive, relational, and moral. But since one's identity or beliefs significantly shape individual perceptions, discourse confirms or challenges one's conception, hopefully, to a more comprehensive understanding of reality.

bell hooks and Jane Roland Martin advocate discourse about prevailing forms of inquiry and knowledge for cognitive and character (moral) development. While both avoid religious language, their theories demonstrate an inextricable link between abstract theory and students' lived experiences; academic pursuit and creating a just society; individual interests and social concerns. Both scholars recognize what Martin calls the transfer value of a liberal education, what some scholars refer to as the hidden curriculum or collateral learning. However inexplicit, schools foster a set of values. hooks and Martin advocate creating a community of scholars whose goals extend beyond the academy. Arguably, these choices are based on a particular conception of self and social ideal.

Evident in hooks and Martin's education treatises is a moral ethic that affirms the individual albeit not at the expense of the larger community and an intellectual pursuit that integrates the affective. While Martin's critique focuses on curriculum, hooks' works decry discriminatory pedagogy across race, gender and class identities.

Discourse or engaged pedagogy is both political and practical. At its best, classroom discourse broadens an intellectual base to avoid a teacher focus while affirming the student's voice and prior knowledge. At their worst, classroom discussions can degenerate to exclusive interactions between a teacher and visibly motivated students. Meanwhile less committed students develop a cunning passivity that belies Martin and hooks' discursive thesis for fostering a community of learners.

The three part analysis, recommendations, and critique presented here draws upon hooks' and Martin's discursive education treatises with regard to curriculum and pedagogy. Part one focuses on Martin's curriculum critique of prevailing forms of inquiry and knowledge with recommendations for reform. The second part explores hooks' engaged pedagogy relative to a traditional teacher-centred approach. Part three critiques Martin and hooks' education proposals for a more meaningful educative experience. The conclusion recognizes the centrality of teachers in students' cognitive and character development.

Analysis

Education as the process of transmitting a cultural heritage raises issues of content, process and goals. In Freire (2000) assessment, education is never neutral. The selection of curriculum and pedagogical strategies challenges or sanctions the status quo. hooks (1994) and Groome (1993) view teaching as a vocation. Teachers enable students' choices. More than mere functionaries of cultural transmission, teachers foster a moral order, directly and indirectly delineating social values and justifications. For Martin (1985) an epistemological equality that underlies the educational conversation requires a multiplicity of perspectives and a diversity of voices. Perkinson's (1995) assessment of education as the imperfect panacea for a social, economic, and political order has made little dent in the ubiquitous faith in schooling across the world. Linking classroom interactions to Biblical education processes, Brueggemann (1982) notes how education like the canon involves the recognition and subsequent maintenance of communal values across generations. As the base script the Torah works in tandem with ongoing prophetic calls to renewal; the wisdom of aligning experience to existing forms and ways of knowing. Not unlike traditional institutions of imparting knowledge, schools guarantee a transmission process that clarifies and delineates social definitions.

An education system that develops discursive engagement over and above the amassing of information equips students for social eventualities rather than givens. This raises two issues—awareness of an existing tradition and engaging such material to broaden the knowledge base. Core curriculum advocates like William Bennett, Allan Bloom and E.D Hirsch Jr., among others, presume underlying cohesiveness and unity in established systems. In contrast, ongoing curriculum construction appears to foster a fragmented and incomplete curriculum accommodating minority views (Martin, 1994). The nostalgia for community that pervades advocates for the unity of Western culture and proponents of counter-cultural noncanonical works appears misplaced, given disparities in curriculum. The whole

debate centres on whether there exists a body of knowledge to which *everyone* should have access in the schools, notes Guillory (1993). Regardless of uniformity in conception, integrating discourse in the teaching/learning process honors human agency and historicity by building upon an existing tradition while allowing learners to appropriate what is for what could be. As a negotiated rather than inherited reality, education, like culture, presumes ongoing discourse, formal and otherwise. Often, the canon debate is portrayed in terms of a choice between order and chaos.

The author's commitment to building a community of learners draws from hooks' and Martin's education treatises. Teacher-centred lectures provide a theoretical base for individual topic areas to generate discourse. To foster student engagement in the learning process, students take responsibility for a particular reading that they share insights from with the rest of the class on an assigned date. Notwithstanding paired discussions and collaborative projects, students respond verbally or in writing to a question or thesis statement related to the assigned reading. They randomly exchange notebooks for peer review before some read out the pieces to the class. Impromptu quizzes spread across the semester help demonstrate student familiarity with class texts and discussions. In addition, class discussions integrate media issues related to theoretical material. The presence of a diverse student body reduces incidents of dismissive 'authority of experience' charges that may ensue in class discussions. But even with this and other strategies a few students rarely participate, claiming among other reasons introversion and fear of crowds. Yet classroom discourse requires a collective effort even for extremely eloquent lecturers (hooks, 1994b). The commitment to stipulated goals and process require passion and preparedness by both parties.

A good conversation is neither a fight nor a contest. Circular in form, cooperative in manner, and constructive in intent, it is an interchange of ideas by those who see themselves not as adversaries but as human beings come together to talk and listen and learn from one another (Martin, 1985, p. 10).

Yet as Martin and hooks maintain, the education conversation reflects a male bias in knowledge construction and conceptions. Pedagogical strategies for the most part further marginalise students on the basis of race, gender, and class. The replication of value hierarchies in curriculum and pedagogy perpetuating old myths in similar transmission styles, undermine the teaching/learning process of veracity and vivacity. While Martin and hooks avoid prescriptive moral injunctions, both recognise the link between rational thought and individual behavior, cognitive and character development. In their treatises, the goals of education are inseparable from the process of education.

Curriculum

Martin and hooks attribute limited discourse in school settings to exclusive curriculum and discriminatory pedagogical strategies. Martin's extensive critique of mainstream curriculum highlights consistent exclusivity in knowledge construction.

An exclusive education base and goals, a charge Martin levels at mainstream education, is partial and myopic particularly in its social definitions and inquiry. Similarly hooks notes the role of power and ideology in the sociohistorical construction of knowledge, education, culture, identity, difference, and social relations. For hooks, racism, classism, and sexism preclude particular students from classroom discourse. While focusing on sexism in knowledge construction, Martin also decries the omission of the social minority perspective as educational history and philosophy demonstrate. Both scholars highlight the importance of theory informing and guiding practice.

Saying nothing about the external issues of inclusiveness, relevance, and meaningfulness, our elders sing the praises of a curriculum that had no space for portraying blacks as human beings—in American history they were seen as slaves and then as objects of Lincoln's Emancipation Proclamation, elsewhere they were invisible. They extol a course of study in which women were invisible in both the public and their private homes. They seek to restore an American education that had no room reserved for American Indian cultures and no place in which the poor, whether male or female, of color or of no color, were accurately depicted (Martin, 1994, p. 220).

The Eurocentric bias in mainstream textbooks legitimates the normative status of White males while providing scanty coverage of the lived realities and perspectives of women and people of color (hooks, 1994a). hooks' writings decry the equation of white middle/upper class male experiences and cultural histories to a national heritage. The United States has appropriated Christopher Columbus as a mythical symbol of a self-created identity while conspicuously omitting its violent separation from English cultural and political icons as well as the decimation of indigenous peoples and elements. The selective choice of memory legitimates domination, oppression, and exploitation rather than reciprocity, community, and mutuality.

Martin maintains that what passes for social definitions and academic disciplines—scientific theories, historical narratives and literary interpretations—belies standards of epistemological equality. Conventional wisdom reflects male rather than female ideals, focuses on public at the expense of the domestic sphere, privileges theory over practice, rationality over affectivity, reinforces metaphysical dualisms, and exhibits Eurocentrism over cultural pluralism, among others. A deeply embedded cultural consciousness explains purportedly unquestionable assumptions about education. Defining it as 'guilt by association,' Martin (1994) notes that as

both the 'products' and 'transmitters' of liberal education, [scholars] do not question this culture's underlying educational presuppositions...Trained to interrogate the works of white men, to problematise the idea of a canon, to historicise the concepts of gender and race, and to treat even the human body as a social construct, we are simultaneously indoctrinated in the belief that the present configuration of education is one of the world's brute facts (p. 27).

In this light, discourse broadens the process of epistemological inquiry and definitions to include in hooks' and Martin's proposal, formerly marginalised sources and cultural perspectives. Addressing issues of stability and change, education becomes an ongoing collaborative quest for meaning and relevance. Indeed, Groome (1993) identifies: engaging, attending, expressing, reflecting, accessing, appropriating, as primary elements of a humanising pedagogy that educates for life.

The 'best of what has been thought, said and done' promises certitude. There are 'truths' that pre-exist the individual, a gift to succeeding generations. It is a framework for understanding the world and our role in it. In education, class texts may be critiqued but they structure an educational experience, nurturing, and socialising future scholars. Like stories in oral traditions, education offers concrete truths of persons and events; imaginative metaphors that bind speakers and listeners. None living today experienced the Declaration of Independence in 1776 but we know and believe in it. In transmitting stories, the speaker expresses a public experience of reality. In this light, a hegemonic cultural history is binding and normative across generations. Community concerns precede individual aspirations in providing a framework for social arrangements and policy decisions. The teacher's role is primarily one of transmission and injunction. Similarly, the canonical process in the Hebrew Scriptures addresses issues of continuity and discontinuity as well as stability and flexibility in community. Such a tentative process 'avoids the hazards of rigid *fossilisation* which hold to a frozen, unresponsive canon, and to a deep *relativising* which gives up everything for a moment of relevance' (Brueggemann, 1982, p. 7). Yet, like the Torah that is guarded, protected, treasured, celebrated and preserved, the consensus of a standard text ennobles one version of reality to the exclusion of alternative stories rather than deny their existence.

But, argues Martin (1992), this image of a cultural heritage, or specifically, curricula,

[r]elieves us of moral and social responsibility, [yet] the truth is that every society must pick and choose just what elements of its past—what knowledge, traditions, values, worldviews—constitute the capital it wants to transmit to the next generation...As the world changes, either a culture's choice or the education it extends to its young will begin to be dysfunctional (p. 202).

A community's responsibility revolves around formal and informal probing of the normative, casting off what loses vitality and embracing enriching elements of the present. Brueggemann views the conspirator's plan to silence Jeremiah (Jer 18:18) as pivotal in delineating the process of education in the Hebrew Scriptures. Secular education too has its 'torah,' its priests, prophets and sages. Yet, as our debatable canons are transmitted, scholars, social critics, radicals and revolutionaries forever 'unmask' the status quo while sages seek a healthier balance in interpreting the inscrutable and given. Classroom discourse in hooks and Martin's education treatises delineate the process of a negotiated curriculum and inclusive pedagogies.

Disciplines, Martin maintains are human creations not immutable divine eternal. Her critique highlights male privilege, priority of the public sphere, and theory over practice in education.

Androcentrism vs. Human Ideals:

The absence of women in the texts and anthologies of most disciplines and the androcentric bias of prevailing analysis and interpretations explains the exclusivity in theories and narratives, interpretations, and analyses of contemporary philosophers of education. Martin (1994) cites Naomi Weisstein and Carol Gilligan's work in psychology and Ruth Hubbard in biology to demonstrate the marginality of females in knowledge construction. Specifically, conceptions of disciplines, including educational thought, draw mainly on mainstream philosophers and their sources—Plato, John Dewey, Alfred North Whitehead, Jean Jacques Rousseau, among others. 'In sum, the intellectual disciplines into which a person must be initiated to become an educated person *exclude* women and their works, *construct* the female to the male image of her and *deny* the truly feminine qualities she does possess' (Martin, 1985, p. 3; 1994, p. 74). This, despite historical precedents on female education in Plato's *Republic*, Jean Jacques Rousseau's *Emile*, Mary Wollstonecraft's *A vindication of the rights of women*, and Charlotte Perkins Gilman's *Herland*, among others. Subsequently, the liberal ideal reflects citizenship and society's productive rather than its reproductive process considered feminine (Martin, 1985, 1994). This epistemological inequality reinforces a gender hierarchy at the expense of cross-gender collaboration.

Recovering the lives and works of minorities throughout history provides empowering inclusive models, corrects historical epistemological omissions and reassesses social norms and values (Martin, 1985; 1994; hooks, 1994b; 2003). hooks (2000b) commends the feminist movement for exposing biases in curricula.

Producing a body of feminist literature coupled with the demand for the recovery of women's history was one of the most powerful and successful interventions of contemporary feminism. In all spheres of literary writing and academic scholarship works by women had historically received little or no attention as a consequence of gender discrimination (p. 20).

As a corrective Martin calls for a revision of bona fide topics of study and sources of data in epistemological inquiry and conceptions. Any chance of creating a harmonious world in a two-sex society entails an integration of tasks and functions traditionally assigned to either sex.

To broaden our sources of epistemological inquiry requires integration of sources outside 'standard' texts and established channels of communication such as personal letters, diaries, pamphlets, newsletters, pieces of fiction, and oral sources as well (Martin, 1985). hooks (1994b) identifies personal testimony and experience as fertile ground for the production of liberatory feminist theory that chart new theoretical journeys. She commends men and women who 'dare to create theory from the

location of pain and struggle' (p. 74). hooks, however, remains critical of creating authority of experience, an atheoretical discourse that ignores theory. Minorities should engage existing texts by continuous self-reflection and responsibility that leads to social change. Finding is one thing, telling is another, claims Martin. Knowledge should be shared to raise consciousness.

Even as we work directly to change the negative messages about women and the reproductive processes of society transmitted by religious and secular, popular and high culture, we should raise to conscious level in all students the hidden value hierarchy of society itself. Another step is to build nurturing capacities and an ethics of care into the curriculum itself (Martin, 1985, p. 197).

hooks highlights the importance of early intervention to foster critical consciousness.

Children's literature is one of the most crucial sites for feminist education for critical consciousness precisely because beliefs and identities are still being formed. And more often than not narrowminded thinking about gender continues to be the norm on the playground. Public education for children has to be a place where feminist activists continue to do the work of creating unbiased curriculum (hooks, 2000b, p. 23).

Public vs. Domestic Sphere

Defining history as the record of public and political achievements reinforces productive processes—man's sphere—of society. The focus on society's productive processes—political, cultural as well as economic activities—inducts students into a public world rather than the domestic sphere. Further, the absence of women in historical narratives devalues the reproductive processes—marriage, child rearing and family life activities—associated with females (Martin, 1994). Martin attributes the alarming statistics on child abuse and domestic violence in society to the failure to integrate the reproductive process in society within mainstream curriculum. Epistemological dualisms central to Platonic philosophy promote and support compartmentalisation. Martin's (1995) schoolhome gives equal emphasis to the three R's as the 'three C's of care, concern, and connection—not by designating formal courses in these fundamentals but by being a domestic environment characterised by safety, security, nurturance, and love' (p. 357). Creating inclusive schools involves educating *all* our children in our *whole* heritage.

Martin calls for a radical change in education so that boys and girls learn productive skills for home life and careers in the workforce to avoid portraying masculine activities and experiences as normative. Taking issue with the absence of care, concern and connection in liberal education, Martin avers that the focus on rationality draws scholars away from the real world, with its problems reduced to abstract discourses, a focus that may leave the educated woman second class at best, invisible and irrelevant at worst. Traits of rationality and autonomy,

lauded by Plato's *Republic*, create obstacles for females socialised to passivity and subservience (Martin, 1985). Although advocating women's access to politics, the *Republic* renders the status of women and family a-educational and a-political. Subsequently, some students come to believe that males are superior to females, and the educated female lauded for her masculine-like qualities of objectivity, analysis, and rationality but suffering from lack of self-confidence and self-alienation (Martin, 1994). The subsequent emotional and academic dissonance among female students arises from their acquiring traits valued by society but genderised in favor of males. Females whose participation is atypical and contributions discredited gradually doubt their intellectual capacity, minimise their career goals, and lose confidence: 'It is hard, very hard, to be a living contradiction every minute and hour of every working day and night: the psychic costs are enormous, the threat of ridicule is ever present' (Martin, 1994, p. 111). But then narrow conceptions of social ideals and education disciplines are just as self-defeating for females as male students. Males are illiterate of sympathetic identification, separate love from work, undervalue nurturing capacity; traits society considers feminine. An accommodation involves acquiring traits they and their society considers inferior. Redefining the function of education and restructuring the ideal of an educated person avoids dualisms and value hierarchies. It impacts pedagogy, teacher-pupil relationships, school structures and more than likely our conception of humanity.

Theory vs. Practice

As an analytical philosopher Martin (1996) acknowledges her extensive focus on words and sentences to the exclusion of free will, other minds, good and evil or overall education. The use of academic jargon, inaccessible language, what Martin calls *academese* creates outsiders and insiders to the 'conversation.'

In assigning theory a kind of sovereignty over practice—or, if you prefer, over all practices excepting theorising—the academy's conception or model of the theory/practice relationships coheres nicely with a self-definition as an institution having as few dealings as possible with the everyday world. Indeed, it allows academy members to pursue theoretical knowledge while letting the chips fall where they may (Martin, 1996, p. 604).

hooks (1994b) specifically decries academic preference for theoretical work that is highly abstract, jargonistic, difficult to read, and containing obscure references. Insulated from the material experiences of students—unemployment, overdue rent, childcare and substance additions, classroom discourse boils down to mental gymnastics and regurgitating of facts. Further, education fosters inner harmony at the expense of outward connections. Discounting protests of limited if not absent footnotes and bibliographic references, hooks claims the poly-vocality in her writing attests to the value of employing non-jargonistic language to more adequately address an audience beyond the academy.

hooks (1994) and Martin (1993) note the danger of dualism in schooling. hooks' engaged pedagogy contests the body/spirit dualism that reduces students to disembodied spirits in the discourse. The choice reduces classroom interactions to mental exercises at the expense of people's physical needs and concerns. hooks acknowledges the seriousness of learning but insists that learning ought not be devoid of pleasure and joy. The teacher's passion for ideas and students revitalises the educational experience (Florence, 1998). Martin (1996) recalls teaching a fifth grade boring, mindless, disconnected curriculum that bore little significance to students' lived reality. A dualistic orientation denies the physicality of students, divorces mind from body, school from home, teacher from students, feeling from action, distinctions that also concerned John Dewey. There is little need to link curriculum to the here and now or to the future lives of students. While education may not involve social activism, such dualisms foster schizophrenic orientations among participants. Re-envisioning curriculum would require 'uniting thought and action, reason and emotion, self and other' (Martin, 1994, p. 211).

The claims of equality or objectivity in scholarship are self-contradictory in a society that reflects exclusive policies and practices. A more democratic approach calls for learner and teacher engagement that rests on three pillars—received text, prophetic critic and experiential basis of knowledge and process of knowing. Brueggemann (1982) and Groome (1980; 1993) capture this vision of schooling. Learning goes beyond teacher impositions of reality to an ongoing discourse for a more inclusive reality and vision. Brueggemann expresses the process in terms of 'sorting out what is *given* and what is an *option*' (p. 78). In his view the human person is a generator of new knowledge rather than its passive recipient. The fluidity of such propositions explains the allegiance to certitude and stability both in knowledge inquiry and transmission process. The primary lure of a canon, whether religious or secular, is the evident continuity and goals for education. Groome's (1980, 1993) tripartite conception of religious education or humanising pedagogy leads both teacher and student into an integrative process of: (a) The Story, (b) personal stories, and (c) an envisioned story. Individual stories or experienced reality builds on, affirms or critiques an established story or tradition for purposes of creating a more meaningful story and transmitted intellectual heritage.

A hermeneutics of suspicion addresses deeply ingrained assumptions regarding academic and social knowledge—practices, procedures, rules, relationships, and structures—as well as the vision of a good society (hooks, 1994b, Martin, 1994). A teacher's input works in tandem with students' lived realities to create more meaningful curricula. This requires recognising and building upon historical achievements, inclusive perceptions and achievements, no doubt. The legitimacy of existing theories is evaluated against emerging realities. Martin (1985) calls for acquaintanceship and conversation rather than discipleship and dogma. The review of existing structures and practices entail ongoing discourse despite the inherent risk of cultural or educational discontinuity.

The prevailing authority of knowledge is essentially provisional. What passes as certified knowledge is not far removed from the passionate agenda of the

community. Notes Brueggemann (1982): 'the texts we regard as authoritative and canonical are in fact marginal in their origins and claims' (p. 50). Teachers 'expose the pretensions of the royal system' (p. 52), seeking 'truth' among alternative truths by fostering hermeneutical analysis. In John Dewey's *My pedagogic creed* (1897) the teacher as prophet ushers in God's true kingdom (Reed & Johnson, 2000). Recognising the disciplinary bias in curriculum foundation and its purported impartiality, at the least, presents 'intellectual disciplines as creative human endeavors rather than God-given bodies of knowledge. And, above all, [students] would be treated as active learners: as young discoverers rather than passive receptacles of information' (Martin, 1994, p. 20). In the Hebrew Scriptures the new truth came from the disinherited, prophetic literature questioning the 'embodiment of official power and public knowledge,' the link between 'the substance of truth' and the 'structure of authority.' (Brueggemann, 1982, p. 42). In our time, notes Brueggemann, the call comes from the economically disinherited, the politically powerless and the ecclesiologically excluded. Each era shifts the locus of knowledge and forms of knowing be it religion, science or the rational being. Broadening the conversation in classrooms jars the certitude implicit in established canons and forms of knowing. In the larger society the counterculture challenges established forms of being, knowing and feeling.

Pedagogy

Insofar as schools reflect and sanction social norms and values, exclusive imagery and practice reinforce existing social hierarchies and obstacles to marginalised individuals and groups. The historical bias influences contemporary education theories and practices as well as future guidelines and aspirations in a domino effect across generations and within established social structures. Because precedents legitimate current choices, unexamined flaws spiral out too often, to unintended consequences and degrees. Whether conscious or otherwise, conventional beliefs and prejudices acquire legitimacy in the absence of alternative definitions and visions. In contrast, hooks' call for creating a community of scholars recognises the collective nature of the educative experience. Through discourse, students and teachers affirm, challenge or reconstruct prevailing notions of 'truth.' Movies such as *To sir with love*; *Stand and deliver*; *Dead poets society* and *Mr. Holland's opus* demonstrate the impact of a humanising pedagogy on students' lives (Groome, 1993). The following discussion addresses the impact of discriminatory pedagogy on learning among members of minority groups. It focuses on the impact of gender, race and class biases in classroom discourse.

Gender

Both Martin and hooks acknowledge the impact of alienation on the academic success of minorities. However, while Martin's work focuses on the impact of sexism on the conceptualisation and dissemination of knowledge, hooks' body

of works draws upon her experience as student and professor to illustrate the marginality of women in classrooms.

Look at many of the women's faces, postures, expressions. Listen to the women's voices. Listen to the silences, the unasked questions, the blanks. Listen to the small, soft voices, often courageously trying to speak up, voices of women taught early that tones of confidence, challenge, anger, or assertiveness, are strident and unfeminine. Listen to the voices of the women and the voices of the men; observe the space men allow themselves, physically and verbally, the male assumptions that people will listen, even when the majority of the group is female (Rich in Martin, 1985, pps. 21–22).

I knew from first hand experience the difference in female self-esteem and self-assertion in same-sex classrooms versus those where males were present. At Stanford males ruled the day in every classroom. Females spoke less, took less initiative, and often when they spoke you could hardly hear what they were saying. Their voices lacked strength and confidence. And we were told time and time again by male professors that we were not as intelligent as the males, that we could not be 'great' thinkers, writers, and so on (hooks, 2000b, p. 13).

Posited as the 'Other' in society and school norms, female students battle with tensions between self-worth and cultural constructs of gender. The stereotypes of females as irrational, untrustworthy, and generally inferior, relative to males impacts their self-confidence and aspirations. Further, the ignorance of women's achievements, their rebellious and organised movements against male oppression account for an ongoing sense of powerlessness in females (Martin, 1985).

There are by now enough studies of schoolrooms, playgrounds, college classrooms and extracurricular activities in the United States to lead me, at least, to the discomfiting conclusion that a hidden curriculum in misogyny flourishes in our educational landscape...But the fact is that, whatever other categories they also fall into, those people our culture calls girls and women undergo some terrible experiences in the course of being educated in the United States (Martin, 1994, p. 18).

Arguably, some female students resist participating in classroom discourse due to a socialised passivity and alienation in school settings. They lean to more inclusive, albeit less conflictual assertions in classroom discourse.

But that is one side of the story. In contrast, Sommers' (2000) *The war against boys: How misguided feminism is harming our young men* flips the gender debate by demonstrating that boys rather than girls in the U.S.A are the social and academic victims. She calls the campaign against female bias in education ideological rather than objective. In her view, the de-emphasis of structured classrooms, competition and strict discipline and skill-and-fact-based learning penalises male students. There is evidence to support either claim. On the one hand, besides the increasing numbers of female enrollments and graduates at the college level, female students receive

higher grades and obtain better class ranks in most fields. On the other hand, males continue to dominate the mathematics, science and sports fields.

Race

A society that has normalised exploitative behavior towards Blacks reinforces the self-fulfilling prophesy of black (academic) underachievement. hooks (2003) cites Beverly Tatum's essay 'Racial identity development and relational theory: The case of black women in white communities,' to demonstrate how black students in predominantly white schools may have a diverse group of friends but experience 'greater self-doubt about their worth and value' (hooks, 2003, p. 164). Lamenting the ills of desegregated schools hooks recalls her inability to relax enough to excel or even learn in threatening predominantly white classrooms. As a student, hooks anticipated warmth and care from those similar to her, who provided the stamina to withstand racist assaults. Alienated in such schools and set apart from African American peers the students developed self-doubt that hooks claims pervades black children across class in the United States. Overwhelmed by pressures personal and otherwise, many black students drop out of school. Teachers fail or shame radically conscious students that challenge White supremacist thinking in classrooms. Students allege teacher insensitivity or gross dismissal of their contributions. 'Learning in an environment of anxiety and stress has caused many black folks to lose their faith in the transformative power of education. But the problem was never education but rather being taught by narrow-minded educators' (hooks, 2003, p. 92). She indicts public school systems for becoming 'a pseudo prison where black children are detained and held rather than educated' as disenfranchising students (p. 169). Regardless of the dehumanisation, she enjoins these students to participate in the discourse. hooks urges blacks to be more assertive in expressing even unwelcome opinions, ignore put-downs and seek affirming company.

hooks (1994b, 2003) charges white and black teachers of discriminatory attitudes in imitation of racist America. In conscious and unconscious ways, white teachers expect black students to perform less well than their white counterparts. Similarly Black professors

act as though they believe all black students are lazy and irresponsible...address questions and comments in classroom settings solely to white students...[making] an effort not to acknowledge in any way black students so as not to be open to the critique that they have preferences, a stance which may lead them to overcompensate by being overly attentive to non-black students (hooks, 1989, p. 68).

Conventional views attribute black academic achievement to the impact of a legacy of discrimination, cultural incompatibility with white middle-class values or the prevalence of circles of poverty, violence and despair.

[A] vast majority of black children are neglected...more than 50 percent are abandoned by their fathers...a large body...among the poor and homeless...the continued miseducation...that lets them graduate from high school without basic reading and writing skills, inevitably black children across class, learn early to be subservient and resigned to their destiny (hooks, 2003, p. 187).

Spontaneity and creativity rather than rigid discipline in children threaten existing social hierarchies. Martin (1994) attributes black separatism and (academic) underachievement to cultural invisibility and personal fear.

No doubt some of those young people who do not find their own lives, histories, experiences, worldviews in their school curriculum will manage to make the White man's point of view their own. Unable to establish rapport with a curriculum that does not reach out to them, all too many who fail to see themselves in the norm drop out of school figuratively, if not literally, and retreat into their groups and themselves (p. 224).

That is one rationale for academic disassociation among black students. Conscious or otherwise, choices by individual students and cultural groups enhance or undermine classroom discourse. Through truancy, counter school culture, and disruption of intended schooling outcomes, students disqualify themselves from social and economic mobility. hooks (2003) acknowledges that troubled black children react to overt racism of teaching plans and materials by declaring their own war on education:

They not only begin to actively resist learning, they begin to terrorise those black students who want to learn...Black students are acting in a self-destructive manner when they repudiate all education, but low self-esteem makes it easier to reject the faulty education that is offered rather than do the work, which black folks did in the past, of taking the learning that was needed for our advancement and leaving the rest (p. 90).

Similarly, John McWhorter (2000) attributes poor academic performance among black students to attitudes of victimology, anti-intellectualism, and separatism. Black students avoid responsibility, view schooling as a 'white thing,' and disengage from purportedly mainstream 'white' culture. He roots the problem in individual pathology rather than structural discrimination.

Class

Of the world's 6 billion people, 2.8 billion live on less than \$2 a day and 1.2 billion on less than \$1 a day. Poor people lack adequate shelter, education and health (World Development Report 2000/2001). Specifically, although 35 million people live in poverty in the United States, among them employed adults, schools promote middle- and upper-class values, tastes, languages, and dialects, while classroom interactions

invoke bourgeois experiences and ideals (hooks, 1994b). Economically privileged children have the cultural capital that aids their school success such as literary exposure and familiarity with the power of language. hooks recalls experiencing disenfranchisement given her working class roots in the elitist Stanford University in California. Students from low-income backgrounds felt obliged to assimilate—to talk ‘proper’ and engage in affluent leisure activities that require finances beyond their reach: ‘If one was not from a privileged class group, adopting a demeanor similar to that of the group could help one advance. It is still necessary for students to assimilate bourgeois values in order to be deemed acceptable’ (p. 178). The materialistic thinking leads to individualism, competitiveness, and an obsession with material gain and consumer goods rather than a sense of ethics and self-appreciation. Coletta Reid (1974) recounts a similar experience at a little fundamentalist church college in Oklahoma, an experience many students from poorer backgrounds well recognise.

On scholarship...College initiated me into an alien culture that I knew I had to master to go anywhere. From the first week on I stood demurely chatting and sipping hot tea, took showers and acted like I felt right at home in long-winded academic discussions. I found out that there were hundred books everybody else could discuss that I hadn’t even heard of...But I found that college doesn’t just prepare you for an easier, better-paying job; it insures that you dress, talk, and think like a member of the professional class—that includes thinking you’re better than working-class people and their culture (p. 66).

In this light, students from working-class backgrounds are compelled to surrender memory, to forget the past and claim the assimilated present as the only worthwhile and meaningful reality. Much like interlopers, such students perceive a limited stake in the classroom discourse.

Recommendations

hooks’ engaged pedagogy addresses the exclusivity of race, gender and class classroom discourse by creating a critically conscious community of learners. The process interrogates existing knowledge bases and hierarchical social arrangements. As counter-cultural, it involves border crossing and more so, ongoing reflection of conventional beliefs and practices on a personal and communal level. Similarly, Martin’s call to broadening the educational conversation depends on inclusive perspectives and voices for energy and vivacity. hooks and Martin’s campaign for discursive venues empower students while reflecting life’s ambiguities by integrating typically binary perspectives in knowledge construction and inquiry. In contrast, devoid of discourse, celebrated truths acquire unqualified immutable stature and reverence.

Fostering critical consciousness on an individual and group level deconstructs entrenched epistemologies and creates participatory spaces for the sharing of knowledge, the re-conceptualisation of different ways of knowing, and the mobilisation of agency to effect changes in the world. hooks' 'teaching to transgress,' Martin's 'reclaiming a conversation,' and Groome's 'humanising pedagogy' create such a forum. Discourses on racism, sexism, and classism and homophobia employ theory to critique tradition but also envision more meaningful structures and social relations. Regardless of discipline, teachers can foster critical consciousness by highlighting relationships across bodies of knowledge, generating alternatives and drawing conclusions in discursive forums. hooks' transgressive engaged pedagogy deconstructs established hierarchical relations and definitions of social reality. In order to engage the complexity of diverse human realities in the classroom, hooks includes both teachers' and students' voices and experiences. Because it is experiential such wisdom is not dogmatic. It remains open to revision; is worthwhile but not definitive. She highlights the collective effort in a dialogue. On the one hand the learner and teacher sift through the tradition of experience and the immediacy of experience. However, both also wrestle with the reality as given and observed, aware of its inscrutability and open-endedness. Teachers create forums for analysing experience both past and immediate as well as creating frameworks for understanding reality in its inscrutability. They build on tradition but are not limited by it, neither pliable heirs nor cynics that reject everything.

hooks' vision of community confronts rather than ignores the complexity of difference. A more interactive and dynamic teaching model replaces a hierarchical model of teaching as knowledge transference. It comes from affirming difference as shaped by our identity and cultural legacy. For teachers it is a call to engagement, passion, creativity and a sense of activism, what Groome (1993) terms 'educating for life.' As a community of learners, both learner and teacher listen to, learn from and reflect with each other. The act of sharing experiences facilitates the dialogue and sharing of information that invites participants into a discourse. In contrast, authoritarian teaching practices reinforce power hierarchies in the classroom as well as discourage questioning and resistance to alternate interpretations of purported social knowledge. For such conceptions of the educational experience, the dream class is orderly with passive students who respond when called upon. Teachers equate order and silence (which may well be) to calm and organised learning. However, the model of an all-knowing teacher and learners as objects of knowledge and history bootstraps both into limiting and predetermined roles and visions of society.

Students' voices and experiences are central in hooks' engaged pedagogy. Her call to student engagement goes beyond ordinary talk, therapy sessions, or endless personal confessions. The articulation of one's experience moves one from subject to object, a claim to space and transforming power. Both students and teachers interrogate their complicity in accepting and perpetuating biases of any kind. The process recovers and affirms students' histories for purposes of analysing the social and historical constructions while recognising the need for change.

Rejecting the temptations of competition, jealousy, pugnaciousness and possessiveness, emblematic of rationality and personal autonomy models in the public sphere, Martin (1994) notes how some women distance themselves from 'unreal loyalty to professionalisation' in integrating students' lived realities to link impersonal knowledge to action and abstract theory to concrete practice' (p. 114).

hooks reminds students of their responsibility and crucial participation at the beginning of each semester. That students become active and responsible learners guarantees their visibility, acknowledgement and affirmation in such inclusive classrooms. It is an arduous task for teachers as well as students. hooks (1994b) challenges teachers to create a cultural climate where biases can be challenged and changed, where all border crossings are viewed as valid and legitimate. This does not mean that they are not subjected to critique or critical interrogation, or perpetuate existing hierarchical structures. But as she maintains, the 'risk is ultimately less threatening than a continued attachment to and support of existing systems of domination, particularly as they affect teaching, how we teach, and what we teach' (p. 131). The openness in inquiry and conceptualisation of reality creates spaces of spontaneity, invention, change, and a democratic exchange of ideas. Politically aware and reflective teachers willingly share what they know without the commanding authority of experience and knowledge.

Critique of hooks and Martin

At its worst, Martin and hooks' critique of exclusive curricula and pedagogy presumes an unrealistic uniformity in the educational experience and a somewhat gullible student body. Social and economic realities will always limit the integration of minorities in knowledge construction and inquiry. On the other hand, regardless of cultural identity well-prepared or outspoken students tend to dominate class discussions. To Berube (1992) and Guillory (1993) curriculum and pedagogy decisions reflect practical rather than an insidious orientation. Before the eighteenth century the marginal presence of women authors, primarily aristocratic, is due to their limited access to literacy rather than 'invidious or prejudicial standards of evaluation.' A similar claim can be made of the dearth of black scholarship prior to the Civil Rights movement. Despite the ideological impact

It is without question true that some past writers have suffered an undeserved oblivion; indeed the history of canon formation offers many examples of writers rediscovered after periods of obscurity. What seems dubious in historical context is that such cases can be *generally* explained by invoking the categories of race, class, or gender as the immediate criteria of inclusion or exclusion. These categories might well explain at the present time why some writers have been recovered from the archive, but not necessarily why they ceased to be read. Nor does the circumstance of their being read now mean that they have become canonical—only that they are read now (Guillory, 1993, pp. 16–17).

More recently, while organisations such as NCATE (National Council for the Accreditation of Teacher Education) align college curricula, classrooms have never offered unifying experiences. Class texts and priorities vary across and within departments as well as institutions, either of which exhibits more or less structure than the other. Overall, the fact that women writers do not necessarily express similar values or value similar works reflects the representation of female, black, ethnic, or working class authors in positions of power but does not redress social exclusion. (Guillory, 1993) Ehrenreich (2001) for all her credibility remains an outsider to the life of hard-knocks that underclass and immigrant maids and fast-food workers inhabit. In addition, as marginalised voices gain visibility or rather notoriety, their views become dogmatic, conservative and simplistic and institutional, therefore less critical/analytical, notes Berube (1992).

hooks and Martin portray universities as academic ivory towers that transmit a particular cultural heritage. Although not mandating particular choices, universities endorse selective viewpoints through curriculum and pedagogical choices. But schools transmit a school rather than a national culture, insists Guillory (1993). Notwithstanding university mission statements and stipulated conceptual frameworks for specific programs, the teaching/learning process has never been uniform. That the syllabi rather than an established canon endorse particular views undermines the claim of an ideological curriculum impact on students. Further, syllabi differ between professors and universities, none of which represents the canon in its totality, or even consistency across periods. With all honesty, few students can claim to have read all canonical works or even materials on any one syllabus. Inevitably, syllabi reflect individual choices but also constraints of time and space. Its construction begins with selection rather than a process of elimination, contends Guillory.

Students rarely embody the John Lockean 'tabula rasa' metaphor of readily absorbing transmitted culture. Similar to media audiences, students appropriate texts heterogeneously. In this sense, the critique of purported biases in curricula and pedagogy presumes a premature Skinnerian behaviorism and outcome. Further, hooks' call for student empowerment presumes a particular type of learner, enthused for understanding and growth. Yet, there are students that expect all-knowing professors to deliver the facts into their heads rather participate in a knowledge construction discourse. Some students resent the compulsory participation and resist publicising their opinions and assumptions. Also, students who are privileged by race, gender or sex may resent the affective interrogation of their location and worldview. On the other hand, teachers may engage students of a particular class more effectively despite a similarity in subject matter. Indeed, hooks (1994b) acknowledges the significance of students' choice in classroom dynamics. In some instances, class size more than one's pedagogical orientation determine the degree of interaction. Classroom discourse can spark ideas and learning. However, regardless of racial, gender, or class identity, students who are prepared for class or are outgoing tend to dominate class discussions.

Classroom interactions involve daily negotiation of terrain; including the determination of rules and power relations. Discourse presumes and capitalises on the diversity and creativity of classroom reciprocal power. Even as teachers depend on students for attention and clear response, students look to teachers and classmates for cues about assignments and value as well as penalties of individual attitudes and behavior. Through reciprocal power teachers and students determine the degree and effectiveness of any one educational experience. Albeit unconscious for the greater part, students can disqualify themselves from inclusive classroom discourse over and above school policy or teacher intent.

Conclusion

In sum, Martin views established curriculum as exclusive and discriminatory, reflecting epistemological inequality. hooks extends the critique to pedagogical strategies. Besides the impact of an alienating curriculum, classroom practices further marginalise members of social minority groups. hooks and Martin attribute less than desirable academic performance of particular students to the 'Outsider' stigma. However, the link between school culture and national culture is more tenuous than hooks and Martin stipulate. Despite the rhetoric of multiculturalism and inclusive curriculum similarities across schools (were this true!) neither guarantee uniform education experiences nor redress structural differences among social groups (Guillory, 1993). As differences in standardised scores across the United States demonstrate, inequalities in access to economic and political resources both reflect and reinforce social hierarchies.

hooks' engaged pedagogy and Martin's reclaiming a conversation presume abilities for recognition, understanding and dialogue in social systems. These skills of speech and reception among disparate parties mirror religious belief in what is and what could be, an overarching hope in tomorrow. These scholars' critique of mainstream structures revitalises the very process of education while reconceptualising social ideals and practices. In classrooms, the critique highlights the significance of teachers in the construction and transmission of individual and social identities. Without sacrificing the teachers' role, the scholars underscore the stakes in the teaching/learning process for students and society at large. Social knowledge is far from an immutable eternal truth. Every generation has the moral and social responsibility to select its cultural heritage—knowledge, traditions, values and world-views. By fostering the art of ongoing critique, classroom discourse addresses issues of continuity and discontinuity as well as stability and flexibility in communities. Although idealistic, the vision embraces a more inclusive educative experience in the conception of self and social ideal. It dismisses the concept of an independent self and materialistic worldview. Cultural differences become a prerequisite for a dialogue that respects each group's identity. On a personal level, this involves the assessment of established policies and practices and personal complicity in maintaining discriminatory structures. Acknowledging individual worth as a god-given right challenges teachers and students to righteous living and pursuit of a more

inclusive society. The process requires more than a well-intentioned or eloquent lecturer. Students also have responsibility for creating a community of learners. Progress, notes Martin, can come from the classroom, the pen and the protest line.

ECOFEMINISM—A HEALING PERSPECTIVE FOR RESHAPING RELIGIOUS EDUCATION

Dzintra Ilisko

Daugavpils University, Latvia

Introduction

The ecofeminist perspective can become a viable source for teaching religion in countries where ecological and gender concerns have been considerably neglected in designing religious educational curricula. The ecofeminist perspective is particularly relevant for the Eastern and former communist countries where the challenges posed by the ecological crisis have been notoriously overlooked. The collapse of communist governments in Eastern Europe opened new pathways for ideological debate and understanding of the global situation. The extent of ecological devastation under the state of socialism as formerly practiced in the Eastern Europe casts doubt on the communist approaches to environmental issues.

Similarly, gender concerns are major issues that need address in Eastern European countries. For example, in Latvia, as in other former communist countries, Soviet history has colored the way in which gender equality is perceived. Keller (1997) describes how the Soviet period deformed the notion of gender equality in Latvia and in other Eastern European countries. What the Soviet system referred to ‘equality’ was actually the leveling of all differences regarding gender roles; forcing men and women to do the same work outside the home.

The integration of the environmental and gender dimensions in the religious educational curriculum of schools is one of the major concerns in designing a more sustainable educational curriculum that extends towards a sustainable model of society and a global community. Sustainability encompasses not only environmental concerns, but also refers to political and societal structures, systems and practices so as to render them sustainable on their own. Thus, ecological and gender issues should be perceived as political, economic and educational concerns, and principles and insights derived from the ecofeminist theology can become a base for a sustainable ecological model for reshaping fragmented religious education. Ecofeminism can

become a healing perspective for raising gender and environmental concerns in Latvia, as well in other former post-soviet countries. Its importance is proposed because of the following reasons:

First, politically this movement offers alternatives for human societies that honor the self-determination of women and men and promotes the well-being of the entire planet. It seeks to transform the social, political and religious orders that oppress human beings as well as the earth.

Second, ecofeminism has emerged as a constructive movement imagining new forms of relating towards self, others, God, and the Earth.

Third, spiritually, ecofeminism offers practices and orientations that foster experiences of non-duality and reverence for women and the Universe.

An Ecofeminist Framework for Reshaping Religious Education

There are several main challenges derived from ecofeminist theologians that can become a basis for building a sustainable model of religious education. These challenges comprise: (1) developing an Ecological self; (2) designing non-dualistic God-world relationships; (3) building partnership in God-human relationships; (4) redefining the vocation and the place of a human in the Universe; and (5) building inclusive communities of diverse individuals.

Developing One's Ecological Self

A starting point for religious educators is developing the ability of each individual student to develop one's own self, religious identity and distinctiveness. Several authors address this point. Religious educator Moran (1989) uses the metaphor of language while referring to a better understanding of one's own religious tradition and identity. He sees understanding one's own language as a starting point. Healthy identity formation as Biehl (1991) asserts, involves 'the realisation of potentiality', which means individuals actively maintaining their identity until they fulfill their potentialities (p. 65). Several studies (Jarymowicz, 1987) point out that one's inability to differentiate oneself from others and a low self-structure development inhibits the process of taking the perspective of different others, and adopting a positive attitude towards the different other. According to a Piagetian notion, self-other differentiation is a necessary condition for adopting a non-egocentric perspective. In this framework, exocentric involvement towards the other may occur only if the self-schema is distinct from schema representing others. Self-realisation does not mean the triumph of the isolated ego, but rather the fulfillment of individual possibilities in the context of mutually supportive and ecologically sound communities. The formation of the whole person is not simply a matter of conceptual awareness and cognitive attainment. It is rather personal growth on a level of inner experience, which moves one toward deeper and more expanded relationships and identification with others. As Merton (1978) explains it, on this level of experience one gradually apprehends one's essential human quality in its wholeness

and inclusiveness. In his essay, *Learning to Live*, Merton describes the basic purpose of education as showing the person how to define oneself authentically and spontaneously in relation to one's world, in order to be open to fruitful relationships with others. Education should safeguard the person's capacity for free, creative and genuine relationships with others. In his book, *No man is an island* Merton (1955) points to a paradoxical perception of self-discovery, 'We cannot find ourselves within ourselves, but only in others, yet at the same time before we can go out to others, we must first find ourselves' (p. XVI).

The second step in perspective taking towards expanding ones self is deconstructing the false notions of 'self' and 'the other' (Finson, 1987; Winter, 1985). Moran (1989) suggests that this step involves attentiveness towards one's own language: restating questions, distinguishing terms, uncovering deeper levels of meaning, discovering that the existing definitions are too narrow, as well as noticing different meanings of a word since language is alive and is changing all the time. This involves the process of becoming aware of social constructions of one's own identity, exposing the falsity of language, as well as questioning the dominant metaphors. These dominant metaphors 'furnish the coherence of one's world and impose a fundamental shift on one's existence' (p. 28). Warren (1995) argues that when teacher and student are able to see the metaphor, 'a fundamental shift takes place in one's consciousness' (p. 208). In the process of this fundamental shift 'a radically new consciousness' emerges (Durka, 1982, p. 15). For this new consciousness to emerge, as Durka (1982) argues, it requires rejection of narrow notions of the self and the other.

The Medieval historian White (1969) suggests beginning with abandonment of one's anthropocentric view. In White's view Christianity is the most anthropocentric (human-centred) religion that bears a huge burden of guilt for the hostile attitude towards the other. This also promoted the assumption of human self-importance in the larger scheme of things that become the single deepest and most persistent assumption of all the dominant Western philosophical, social, and political traditions since the time of classic Greeks. The assumption that humans are the crowns of creation, the source of all value, the measure of all things, is deeply imbedded in our culture and consciousness. Anthropocentrism or homocentrism is an exaggerated sense of the pre-emptive importance of the human in relation to all other species. As an orientation to the world, it is an illustration of the existence of a dominant culture, religion, and nation. As Berry (1991) maintains, educational survival involves a journey into intimacy with the universe. On contrast, much of the educational journey of today leads to estrangement from the other. Fox (1995) suggests expanding one's self beyond 'the limits of one's egoistic, bibliographical or personal sense of self' to 'something which is more inclusive than individual self' (p. 199). According to Dewey, the human self is not a fixed, ready-made identity. Dewey's notion of an expanded self includes such attitudes as straightforwardness, open-mindedness, breath of outlook, integrity of purpose, and responsibility towards the different other. Such qualities characterise a person who is extending and deepening an interest in learning from all of his or her contacts

in the world. Dewey calls this posture ‘the essential moral interest’ because it extends towards ongoing, responsive engagement with other human beings and their purposes and hopes (Dewey, as cited in Hansen, 2002, p. 269). Dewey’s conception of self reaches beyond such terms as *self-interesse*, that means ‘to be around and in the midst of things, or to be at the centre of a thing and to stay with it’ (Dewey, as cited in Hansen, 2002, p. 269).

Conceptualising the self as an ecosystem existing within a larger ecosystem can also facilitate the shift from thinking of self as a separate, independent entity to recognising its complete interdependence in the totality. Similarly, ecofeminist thinkers define relatedness as the most essential condition of a human being. In the cosmology advanced by ecofeminist writers, there is no such thing as an isolated human being. The self is seen as a part of an interdependent, interconnected and interacting complex of events and things. Ecofeminist thinkers deny abstract individualism and define relations as a most essential condition of a human person. To be human is to be essentially directed towards others (McFague, 1995; Gebara, 1999). In the ecological subject-subject model, also called by McFague (1993) the agent-agent model, the world is seen as composed of living, changing, growing, mutually related, interdependent entities, of which human beings are one, and where none of these entities is a mere object, but all in different ways are subjects. The ecological vision of a human person does not fuse all subjects into one. Each subject has its own individuality and its own distinctiveness, its own goals and ends. To be essentially related to other persons, and at the same time, to be essentially self-directed, unique individuals whose actions and concerns are valuable in themselves, are not two conflicting aspects of every experience. The ecological vision underscores the most radical unity (everything at some level is interrelated and interdependent with everything else) and the most radical individuality (everything is different from every other thing).

Practical applications in reshaping religious education involve adopting ecological attitude towards oneself and others which includes; (1) *beneficence*—serving others, or doing good for others; (2) *esteem of others*—respect for the integrity of all things, the avoidance of any abuse and manipulation or destruction; (3) *receptivity*—adopting an attitude of awe towards nature; (4) *humility*—avoiding feelings of arrogance and feelings of superiority over nature; (5) *understanding*—seeing ways of sustaining the environment; and (6) *communion*—being in solidarity with the Earth (Nash, as cited in Hill, 1998, p. 272).

Designing a Non-Dualistic God-World Relationships

In formulating this challenge, ecofeminist theologians Gray (1981), McFague (1993), and Gebara (1995) allude to the role of Christian theology that fostered a series of interlocking and destructive dualisms. Because Christianity has strongly affected the shape of Western culture, these dualisms are pervasive in the thought structures of the culture. The basic theological dualism is the split between God and the Universe. The doctrine of creation *ex nihilo* is centred on an understanding of

God as pure spirit. The world thus is created and set apart from God. Consequently, a dualism of mind and body in the human person is reinforced (Gray, 1981). Ecofeminist theologians imagine different patterns of relating between God and world that can be described in 'agential-organic' terms (world as God's body, a body empowered by divine spirit) (McFague, 1993, p. 140). As the author explains, the agential model preserves transcendence, while the organic model underscores immanence. The agential model overemphasises the power of God at the expense of the world. Similarly, the organic model alone tends to collapse God and the world, denying the freedom and individuality of both. In the 'agential-organic' model suggested by McFague (1993) the values of both the agential and organic models can be preserved, and God is related to the world as spirit is related to body. Thus, God is not separate from, over, and above the Earth, but rather is a God who is in all things, and who binds one to deeper relationality, motivated by genuine mutuality and interdependence.

These non-dualistic patterns of relationships between God and the world are reflected in McFague's (1993) model of the universe as 'God's body.' This metaphor implies deep involvement, awareness and empathy with the Earth. To see the Earth as God's body profoundly change our relationship to it. McFague's image brings together immanence, transcendence, and the dignity of both creation and Creator. In her model God is not a distant, abstract deity, but a concrete, bodily one. According to this perspective God must not be mistakenly defined in pantheistic terms but rather in pan-en-theistic terms where the potentialities of life always are an open-ended possibility of all that is different and unpredictable (Gebara, 1995). This image helps one to see the world in the dialectic between human community and nature, as a web of life, which needs to be sustained by a loving community. The body is the whole; human beings cannot subjugate nature, and neither can the human community be subjugated under nature. There is a challenge to keep a balance.

The challenge posed for religious educators in designing a religious curriculum includes critical reflection on the traditional images of God that set God off from the world or equates God with spirit. Ecofeminist theologians encourage challenging the monarchic images of God and suggest images of a God of justice who is concerned for all marginalised and oppressed. McFague (1987) suggests a 'thought experiment,' with metaphors and concepts so as to formulate a new unified and interdependent framework for understanding God-world relationships. She encourages entering into 'the most radical kind of deconstruction and reconstruction of the tradition' (McFague 1987, p. 20). This process involves both a critique of domineering images of God and experimenting with new images that are commensurate with ecological sensibility of the Christian faith. She believes that new metaphors in naming God can serve in recontextualising the present dominant metaphor of Father in a parental rather than patriarchal direction. The metaphor of a Friend suggested by McFague (1987) indicates the intrinsic value of all creation. She suggests considering God as Friend of the world and all creation. Implications for ecological relevance and responsibility are evident here: humans are challenged to be Godlike and care for the Earth.

The other metaphor of God as a lover also denotes the valuableness of the world. God as lover finds all species valuable, attractive, and precious. God as a lover underlines the importance of every body and the well-being of the whole Earth. As a lover God wants the creation to be whole and in balance. According this view sin is disordered love of self, and the refused to see the interconnectedness of world, the God, and ourselves. The awareness of this love gives courage to participate with God in building the Earth's wholeness and in acting for it.

Building Partnership in God–Human Relationships

In formulating these God-human relationships ecofeminist theologians begin by offering a critique of how Christian scriptures fostered all kinds of dualisms especially with reference to the text of Genesis Chapter 1. As Gray (1979) argues God who is, 'above all and beyond all' created a person to have domination over creation. This mythical story from Genesis Chapter 1 puts a man 'above' the rest of creation, and defines the existence of woman in relation to man as 'helpmate,' and therefore reinforces an androcentric view. The other account of the creation of the world in Genesis Chapter 2, can be described as anthropocentric. Different interpretations have blended the accounts in Chapters 1 and 2 into a single creation story so that both texts represent a hierarchical and anthropocentric view of the world. Both myths support two conceptual errors: (1) they identify maleness with humanity where man is superior to women; (2) they assert humanity's superiority over the rest of creation (Gray, 1979). God is related towards creation as a subject manipulating passive objects. This model reinforces similar patterns of relations of mastery in human relations. McFague (1997) claims that Christian theology promoted I—It or subject—object models of relatedness. In this authoritarian model, the self is 'nothing' in relation to the authority 'above,' and everything to any subject 'below.' The consequences of such thinking represent the patterns that tend to repeat themselves in relations between human beings: men viewed as superior to and the opposite of women.

Ecofeminist theologians pose a challenge for religious educators by prompting an alternative to hierarchical relations and offer a participatory image of divine – human relations. By deconstructing and reconstructing the dominant symbols of the Christian tradition, ecofeminists suggest using relational language to define God-human relations, keeping the liberation of the oppressed, including the Earth and all creatures, in central focus (McFague, 1987). While ecofeminists urge using feminine metaphors describing the Divine, there is also a danger of developing a one-sided view of 'the feminine' metaphors and stereotyping women's reality by characterising God only as nurturing and caring. Johnson (1992) argues that 'nurturing and tenderness do not exhaust the capacities of women. [...] Nor is intelligence and creative transformative agency beyond the scope of women's power without suffocating women's potential' (p. 54). Female imagery has a capacity to present God not only as nurturing, but also 'powerful, initiating, creating-redeeming-saving, and victorious over the powers of the world' (Johnson, 1992, p. 54). Ecofeminist

theologians believe that patriarchal metaphorical images should be discarded since they cannot express the reality of our time. They reject the traditional metaphors of God as a ruler or as a cosmic moralist, and they envision a new understanding of power and love that is compatible with feminist thinking. They regard images of God as king, lord, ruler, and patriarch as inappropriate, and suggest metaphors of mutuality, interdependence, caring and responsiveness. Ecofeminist thinkers suggest using relational language defying God-human relations. They put forward an encompassing agenda to deconstruct and reconstruct the central symbols of Christian tradition in favor of life and its fulfillment, including the Earth as a central focus.

Redefining the Vocation and Place of a Human in the Universe

The images of the human vocation in Christian tradition can be viewed within ancient cultural contexts. These images reflect the self-understanding of particular peoples. Christian tradition contains different perspectives on the human vocation. Today we can put the question of how the image of human vocation can be defined in light of our situation. The modern perception of the vocation of human as a master of all technological power to rule the Universe corresponds to the ancient biblical priestly view.

The anthropocentric model of domination that places humans over creation has been disastrous in building healthy relations towards the world. It has resulted in a narrow theoretical understanding of the world and the human person that has fostered a disastrous ideology and practice of exclusivity. Eco-theologians critique anthropocentrism as disastrous, logically inconsistent, morally objectionable, and incongruent with a genuinely open approach to the world. The anthropocentric position views the world as manipulated and controlled for human benefit as if it were a machine. This finds its expression in disastrous practice such as pollution and the degradation of fisheries and forests. In contrast to domineering and exploitative kind of relationships, ecofeminist theologians suggest different patterns of relatedness between the person and the world which are based on values of partnership and stewardship. The term 'partnership' is used in the New Testament for describing the values of sharing and mutual community. Russell (1986) refers to the biblical vision of New Creation: Solidarity between the whole of the created universe—humanity, nature, and God' (p. 26). An appropriate metaphor for our times would be stewardship in describing human-world relationships. Thus, as Wilkinson (1980) writes, the vocation of a person is to be a steward of creation. And to be fully a steward of creation means 'accountability to God and embeddedness in nature that make the human perfectly constituted to carry out the task of stewardship' (p. 230). To be stewards also requires an understanding of justice, of just distribution of the world's resources, so that all human beings have their basic needs met and are in position to exercise the rights and responsibility of stewardship.

McFague (1993) suggests a metaphor of the world as God's body in locating person's place. She defines a person not as dominator but as a partner with God

in building a sustainable future. Likewise, Lucien (2001) argues, 'The body gives location, place, and concreteness to personal presence. The body is the reason that having home, being at home is an essential element of personal existence' (p. 14). Building healthy relations with the Earth means adopting not an attitude of a manipulator, but rather an attitude of hospitality. Lucien (2001) defines hospitality as a fundamental aspect of the Christian faith that is reflected in Paul's *Letter to the Ephesians*:

So then you are no longer strangers and sojourners, but you are fellow citizens with the holy ones and members of the household of God, built upon the foundations of the apostles and prophets, with Christ Jesus himself as the capstone (Eph 2: 19–21, Revised Standard Version).

There are several strategies of sustainable living which can challenge religious educators today. For example, one of the alternative ways of living on the Earth is adopting a simple lifestyle. This does not imply traditional forms of asceticism, but rather means small actions such as adopting a simplistic lifestyle, abstaining from shopping, and contributing money and time for ecological works. Another response to the ecological crisis expressed by Johnson (2001) is 'a contemplative response.' This implies the affirmation of otherness and the ability to appreciate the beauty of nature for its own intrinsic value. Such perspective points to the uniqueness of every being. Another response is what Johnson (2001) calls 'a prophetic response' that gives the imperative to act in favor of care and restoration. In this way, ecofeminists see women as *image Dei* in the exercise of stewardship on the Earth.

Realising one's duty to be co-creators with God, the response, as (Durka & Smith, 1976) suggest, is to realise that both women and men have power and responsibility to reconstruct the world, reshape their lives, and create new option for future (p. 78). Such reconciliation and mutuality, 'offers pathways for yet further development' (p. 79). Thus, life becomes the very process of interaction between humans and the world whose emergent meaning depends 'on how intelligently we respond to the world's action upon us' (Durka & Smith 1976, p. 77).

To build new patterns of relatedness on all levels, such as God-world and a human person or human person and the world, religious educators suggest a need for a process of conscientisation and social change. Feminist consciousness speaks of an increased mental and emotional awareness of life experiences of women and others as marginalised. Raised consciousness of the marginalised initiates both a radical examination of one's reality, uncovering the structures and forces that oppress women, and a determination to move against those structures. Thus, feminist consciousness can be characterised as 'a process of becoming aware of oneself and one's surrounding' (Finson, 1987, p. 65). For a new consciousness to emerge, it is necessary to reject associating femininity with passivity. It requires adopting 'a variety of ways to approach things from a distinctively feminine point of view' (Durka, 1982, p. 75). In the process of conscientisation, a birth of one's voice takes place. This process of birthing that confirms: 'bodyliness, enfleshment, new life, passion, emotions, and pain...It tells us that we also bear responsibility for

ourselves, to other selves, and for the Earth' (Harris, 1988, p. 87). Merton describes this process of birthing as follows:

We have experienced creation, not re-creation, or new creation, but a primordial creation of ourselves. In the new shape of our experience, we have confronted death, but not death of the self, but death to self. We have experienced the death of the stereotyped images, the breaking of them from within so that self can be affirmed and potentialised (Merton, as cited in Harris, 1988, p. 85).

Feminist religious educators believe that when people arrive at critical awareness they have a capacity to recreate and transform the world, and therefore, build new models of relationships between humans themselves, between humans and God, and between the Universe. As Durka (1990) illustrates, Freire's liberating theory provides insights about how to better understand and change situations that are oppressive to a person. The movement is through stages: first, from magical conforming, where oppression is denied; to naïve reforming, where personal reforms are taking place; to the stage of critical transformation which takes place within both the self and the system.

Ecofeminist religious educators suggest multiple strategies of action as a response to a multiple factors of any situation. According to Moore (1998) if only one definition of the problem and one strategy for action are put forth, the likely result is an inadequate response to the problem. She suggests four different kinds of politics towards engaging students in transformative social action. These are the politics of suspicion, politics of grace, politics of future, and politics of solidarity. The politics of suspicion means being suspicious and naming and facing norms, symbols and assumptions underlying institutional rules. Thus, students with a raised consciousness will become aware of ecological disaster and other evils. A politics of grace means fostering one's relationships with God and the Earth, wrestling with incompatibilities across class, race, culture, and gender; and building solidarity with other communities. The politics of grace will lead to a politics of future that implies envisioning a transformed world – ecological, personal, social, and global. Finally, the politics of friendship and solidarity will help befriending the stranger, offering hospitality to the outsider, oppressed, rejected, or silenced. It also means encouraging wider conversation. Here Moran's (1989) metaphor of 'the second language' is useful in promoting such a dialogue. This means adopting a respect for the second language by responding to the needs of all students, and by inviting the assistance of those who have a better facility with the language (O'Gorman, 1992, p. 616).

Religious educators are challenged to help students develop a consciousness and code of behavior regarding their relationships with the natural world as an integral part of their spiritual development and practice. This entails helping students to reinterpret important sources within the tradition—scriptures, symbols, beliefs, and ethical principles—that affect attitudes and practices related to the environment. This will help students to uncover new deeper layers of understanding and meaning at the core of their tradition in terms of their relevance for today's global environmental

imperatives. It will also help students to grow in sensitivity and responsiveness to the sacredness of creation and to see the connectedness of the Universe (Mische, 2000).

Practical Implications for Religious Educators in Building Inclusive Community of Diverse Individuals

Ecological perspective helps one to envision a classroom as a community of learners, which is not narrowly viewed from the perspective of sociology, but rather as the highest value, that epitomises such qualities or principles as inclusion of diverse voices, interdependence and interrelatedness, and relatedness. Of all qualities of ecological vision Durka & Smith (1979) consider community as 'the most prominent fulfillment' (p. 104) of ecological vision. Similarly, as Dewey remarks: 'Under some conditions the completeness of the object gives the experience a quality so intense that it is justly termed 'religious'' (Dewey, as cited in Durka & Smith, 1979, p. 104). The authors conclude that community as the highest quality can be called 'holy' community, because its essence is communion, and communion is the essence of religious experience. Here 'people meet at the level of common humanity' (Scott, 1981, p. 149). Moran (1976, p. 142) also presents an ecological vision of community as the highest value which he describes as a 'universal sister/brotherhood'. Such a community includes humans and nonhumans in a relation that cultivates differences in unity.

This vision of community is not yet realised. It extends beyond the borders of community as a social form of organisation towards a quality of a human experience. This wider meaning of community implies a genuine human context of interdependence, mutual support and sense of belonging. 'It is marked by concerns and openness, shared values and visions, common meanings, and commitments. Essentially, it designates the particularity human way of being human vis-à-vis other people' (Scott, 1981, p. 148). The ideal embodied in community is 'the movement towards unity and union with others: community and communion' (Harris, 1989, p. 76). This ideal marks the time when 'all will be one,' 'a dream of a new heaven and a new earth where death shall be no more, neither shall there be mourning nor crying nor pain anymore' (Revelation 21). It is 'the move towards wholeness, unity and union' (Harris, 1989, p. 79).

This ideal of universal community can be realised on the micro scale of the classroom community when the curricular activities appropriately attend to fostering community. First, community can be fostered by attending to language in both the context and the process of teaching religion. Second, a classroom community that values differences can be built by including persons who are usually excluded by ethnic, gender, or other criteria. Such befriending acknowledges and accepts differences, and by practicing presence, receptivity, hospitality and care (Harris, 1989). The philosopher Marcel (1987) describes the meaning of presence in this way:

It is an undeniable fact, though it is hard to describe in intelligent terms, that there are some people who reveal themselves as 'present' – that is to say at our disposal. There is a way of listening, which is a way of giving, and another

way of listening, which is a way of refusing, of refusing oneself. The material gift, the visible action do not necessarily witness to presence... Presence is something, which reveals itself on a look, a smile, an intonation or a handshake (Marcel, as cited in Harris, 1989, p. 86).

Receptivity is the ability to listen not only to oppressed persons, but also to the voice of entire Creation. It leads towards listening to and including the voices of the non-human world. Hospitality, as Durka (2002) argues, is the feature that is easiest to recognise in the classroom setting. She highlights that when hospitality is not 'merely a superficial acceptance that glosses over differences' but is offered authentically and is born out of a deep commitment to the search for truth, it offers an opportunity for students to engage in deep conversation with one another, and to affirm: 'I am glad to be here' (p. 46). Such a warm and welcoming environment of acceptance 'generates deep conversations' and helps to 'build bridges among students' (p. 46). Classroom community also implies an ethic of care: care of oneself, others, the neighborhood, and for a sustainable society on the Earth. Genuine caring implies not only caring for one's needs, and desires, but caring for real different others, and the Earth as well. While care begins with oneself, and the particular people and grows gradually outward into care for all oppressed as the interlocking connections between different forms of need, discrimination and oppression become evident (Noddings, 1984).

Ecofeminist theologians such as McFague (1993, 1997) and Gebara (1999) advocate the principle of inclusivity which is not only an aesthetic appreciation of the intrinsic value of all forms of life but a different kind of thinking regarding the human and non-human world. The contribution of ecofeminist thinkers such as McFague and Gebara lies in challenging a mainstream feminist understanding of the uniformity of women's experiences. They are similar to Black feminists in that women's experiences are varied according to culture, class and race. They hold that what is common is gender oppression because it affects all cultures, races, and classes, while differences exist within the reality of gender.

Ecofeminism discloses how women's experience has been conditioned by the expectations of a patriarchal system of families, society, education, and religion. It determined what it means to be a woman, a wife, and what would be women's role in culture, politics, and religion. The effects are many. First, patriarchy repressed and devalued women's experience. Second, it absolutised male experience as representative of human experience in general. Ecofeminist theologians believe that by paying attention to their experience, women can begin to identify the 'myth of the feminine'. By naming the meaning of their experiences for themselves, women can begin to reject these myths, confront social oppression and open their birth for themselves (Ruether, 1995). Harris (1988), a religious educator, uses the metaphor of voice in describing women's journey from silence to listening to their voices, towards finding one's inner voice, and finally, integrating one's voice with others. Ecofeminist vision is all-inclusive. The process of finding one's voice implies not only striving to reclaim women's voices, but also the voices of others, and

'the voices of entire peoples' (Harris, 1988, p. 104). It enables religious educator to realise that curriculum is silent not only about women but also about many others without political power. Ecofeminist religious educators expand the term 'oppressed' to include all those without power, such as the poor, Third world people, and persons with mental and physical handicaps. The process of birthing allows women to engage in exploration of their voices. It involves the process of affirmation, liberation and transformation.

Another way of recognising a diversity of voices and experiences means teaching tolerance towards the other religious traditions (Moran, 1979). Helping students to appreciate one's own religious tradition, and developing students' sensibility to listen 'the second language' (Moran, 1989) means developing tolerance towards diverse traditions, experiences, and understandings.

In sum, inclusion of diverse voices and experiences is an essential quality of a classroom as an ecological community. It means that all students belong. It also includes the security, open communication, mutual thinking, shared goals and objectives so that the classroom becomes a place where everybody's experience is valued (Harris, 1989; Moore, 1989). The curriculum should be organised in such a way that teaches the responsibilities which extend towards all life on the planet. This means extending boundaries of community beyond immediate family and friends, and embracing all peoples. Such extension is a respect for the rights and needs of future generations that help students live by a sense of kinship with nature and an ethics of ecological responsibility. For ecofeminist theologians, human responsibility means actively participating in God's continuing creation by mending one's broken relations to the earth, to each other and to God. So, as Soelle (1984) concludes, 'The more a person develops creativity, delves into the project of liberation and transcends his or her limitation, the more God is God' (p. 24).

Conclusion

Challenges derived from ecofeminist theological thought and feminist pedagogy can become a viable source for building a more sustainable model of religious education. Ecofeminist theologians can contribute to religious education by offering a new theological vision that recognises the interconnections between all systems of oppression, rejecting all patterns of domination and exploitation, rethinking what it means to be a human person, and envisioning different understandings of God, world, and the human person. Ecofeminist theology envisions new ways of relating towards self, others, God, and the natural world. That can help religious educators to formulate a better vision of how to live appropriately on the Earth. Clearly, contribution of religious educators is in designing a curriculum for religious education that is inclusive of the experiences and voices of all marginalised and oppressed that is transformative of relations on all levels. Challenges derived from ecofeminist theological thought and feminist pedagogy play a significant role in reclaiming not only the experience of women, but also of those who are marginalised and oppressed, including non-human nature and the Earth.

WHAT IS RISING? THE TEACHING OF MARIA HARRIS

Aileen Carlin Giannelli

Graduate School of Religion and Religious Education, Fordham University

Introduction

Music was the background and the heart of Maria Harris's life as religious educator. The silence before the piece begins, the rests within it, the arpeggios that vitalise its progress, the thoughtful andantes that beckon the listener to reflection, the interweaving harmonies and dissonances, all serve as metaphors for both the process and the content of her work. She was born into a home filled with music. 'Her father, Edward, gave her mother, Mary, a Steinway baby grand piano as a wedding gift. The gift of this piano enabled her mother 'always' to play and sing, and Maria started at the age of five' (Dorney, 1997, p. 189). She was also born into a Catholic home located in New York City. For her, Catholicism shaped her heart, her mind, and her imagination so that they were 'essentially sacramental, essentially communal' (Dorney, 1997, p. 181). New York enriched her experience with a sense of the breadth and vitality of the human community.

Dr. Harris's journey as a religious educator began quietly when her religious community, the Sisters of St. Joseph of Brentwood, assigned her to teach music to elementary school children in 1952. As she prepared her students for liturgical worship, she came to understand that religious education cannot be limited to cognitive learning, but must address the aesthetic dimensions of a person's knowing (Dorney, 1997). In 1986 she wrote, 'A person speculating, thinking, knowing in the aesthetic mode does not think *about* objects: trees, rivers, clay, tone. A person knows *them*, thinks through *them*, in actual, concrete engagement' (Harris, 1986, p. 120).

Her journey from elementary school music teacher to national consultant in religious education and visiting professor at New York University included doctoral studies at Union Theological Seminary and Columbia University in New York. The open window of the Second Vatican Council, accompanied by her experiences at Union Theological, brought new themes, new rhythms, new understandings to the song of her life, or as she might put it, to the dance of her spirit.

Like New York University today, Union Theological had a multidimensional, ecumenical student body and faculty population. This setting provided a medium in which to appreciate the religious understandings of others, particularly Protestants and Jews. Maria's doctoral work led her very consciously to reconceptualise the meaning of religious education (Dorney, 1997, p. 181).

Eventually she held both the Howard Chair of Religious Education at Andover Newton Theological School and the Tuohy Chair in Interrreligious Studies at John Carroll University in Cleveland, as well as teaching posts at numerous colleges and universities as diverse as Princeton, Fordham, Immaculate Conception Seminary, and the Presbyterian School of Christian Education. An international lecturer, well known in Korea, Ireland, Canada, Australia, Bermuda, New Zealand, Germany, and the Netherlands, Dr. Harris also served as Scholar in Residence at Loyola University in Chicago, and delivered the Bradner Lectures at Episcopal Theological Seminary, the Madaleva Lecture at St. Mary's College, Notre Dame, the Pollock Lectures at the Atlantic School of Theology, Nova Scotia, and the Schaff Lectures at Pittsburgh Theological Seminary. Her published works, 13 books and over 85 articles, chart the development of her life and thinking from the practical *DRE handbook* (1971), to the theoretical *Teaching and the religious imagination* (1987), to the spiritual *Proclaim jubilee!* (1996).

Throughout her lifetime as a religious educator, Maria Harris developed what she called a 'lifelong and lifewide approach to learning and teaching' (Harris, 1998). The depth and richness of her published works defy easy summary. She always charged her students to be alert to what Elliot Eisner (1979) called the 'null curriculum,' the content and procedures of the curriculum that are left out. With the warning that much has been 'left out,' this essay will examine Maria Harris's work through three lenses, the rhythm of teaching and learning, the nature of knowing, and the creating of community.

Before examining her work through these lenses, it is essential to define what Harris meant by the term, 'religious education.' With her husband and colleague, Gabriel Moran (Harris & Moran, 1998), she identified two aims of religious education: first, educating people to take part in a particular religious tradition, *teaching the way*; and second, developing religious understanding, *teaching to understand religion*. She did not limit the term, 'religious,' to her own discipline, but saw all teaching as connecting with the numinous and the holy. She insisted '... to honor and teach the dimension of depth present in all education is to educate religiously' (in Dorney, 1997, p. 182).

Her convictions about the tasks of religious education have led her to question the commonly perceived views of what constitutes learning and knowing. For Harris, cognitive knowing must be completed and complemented by aesthetic knowledge, a knowledge that not only facilitates the mental capacities of imagining and envisioning, but also reaches out to all of the senses and brings them to the service of the religious and the spiritual (Harris, 1979).

In discussing community, Maria Harris paid special attention to the needs of women from the earliest years to what she terms the 'jubilee' years at the end of

life (Harris, 1995). While the advancement of women holds a special place in her writing and teaching, her design for community casts a wider net. She proposed a community of inclusion, based on service and justice, attentive not only to feminism, but also to the demands of ecumenism and a committed reverence for creation (Harris, 1989; 1988).

Dr. Harris encouraged the notion that the advancement of knowledge and the creation of community are only possible when they are developed through a rhythm, a dance, a series of steps that flow in and out of each other.

This article will explore the themes of knowing, community, and rhythm in Maria Harris's life and work. She has been called one of the 'foremothers and mentors' of religious education (Keely, 1997). It is hoped that examining the dance of her spirit will provide both theological and practical guidance for those who have embraced the vocation of religious educator.

Rhythm

Basic to an understanding of Harris's work in religious education is her conviction that teaching is a religious act. Drawing on the insights of feminist, process, and liberation theologies, she proposed a spirituality of teaching. She observed that we cannot say a word, we cannot read a text, we cannot write an essay without trying to walk with God, without trying to touch God, even if we are not aware of the walking, the touching (Harris, 1988, p. 12). The music at the centre of her heart flowed out into her vision of this spirituality. She said, 'I will be working from the basic truth—asserted by modern physics and by process theology—that the core of things is not substance, it is rhythm: movement, ongoing discovery, continuing, unfolding (Harris, 1988, p. 13). In the *Madaleva Lecture in Spirituality*, given in 1988, she described five generative steps that not only provide a theoretical basis for a spirituality of teaching, but also describe a practical pedagogy for pursuing a religious education curriculum. The steps are silence, remembering, ritual mourning, artistry, and birthing.

Educators are familiar with the steps, or stages, of developmental theorists. These are usually envisioned as a staircase where one step logically and unalterably follows the other until the goal is reached. True to her musical heart, and crediting collegial conversations with Judith Dorney, Harris rejected this notion.

But the series of steps I want to pose in contrast are in a different form: they are steps in a dance. Using this metaphor, we can immediately draw on the power of rhythm, and study how in the work of spirituality and teaching, a more organic and human series of steps than the ladder and the staircase are those which like a dance can go backward and forward, can incorporate one another, can involve turn and re-turn, can move down as well as up, out as well as in, and be sometimes partnered, and sometimes solitary (1988, pp. 14–15).

For her, movement through the steps cannot be planned beforehand, but must emerge from the rhythm of engagement with the world, context, environment, and task.

Silence

Harris saw silence as a demon to be exorcised and a healer to be embraced. Drawing on the work of Elliot Eisner (1979), she explored the three curricula that live at the heart of every curriculum: the explicit, the implicit, and the null. Religious educators know and embrace the explicit curriculum. It is clear, outlined in the syllabus, printed in the teacher's manual and text. The implicit curriculum refers to the structure of the teaching, the environment for learning, the pattern of speaking and listening. The implicit curriculum is surfaced by paying attention to who speaks, who is heard, how concepts are shared. Is the teacher the expert filling empty vessels or are the students involved in the discourse? Is teaching focused on cognitive learning or are multiple intelligences addressed?

The null curriculum poses something of a paradox. 'This is the curriculum which exists because it does not exist, for it refers to areas left out, ideas not addressed, concepts not offered' (Harris, 1988, p. 20). In its silence, the null curriculum speaks mightily. In *Man for all seasons*, Cromwell charges that Thomas More's silence is 'bellowing up and down Europe' (Bolt, 1960, p. 98). Harris warned that educators can miss the null curriculum. Sometimes the explicit curriculum, and by extension, the explicit pedagogy, is so entrenched that it has taken on the costume of what is natural, real, exclusively authentic. In *Women and teaching* (1988) Harris urged educators to examine and name the silences in the content and methodology of their teaching so that those silences can be addressed. Elizabeth Schussler Fiorenza (1984) suggested that scholars employ a hermeneutic of suspicion to question underlying assumptions, models, and interests, and then employ a hermeneutic of imagination to restore what has been omitted. Harris agreed. For her, it is in healing silence, in thick listening, that the implicit and null curricula can be brought to light.

Paradoxically, healing silence can manifest itself in a refusal to be silent, but rather to use voice to affirm and challenge the implicit and null curricula. It can also encourage teachers to listen to the silences of students, to wait for that silence to work, and to lead students to authentic voice. Of great importance for the religious educator 'is to remember that all music has places of rest and that a spirituality of pedagogy must have room for prayerful silence' (Harris, 1988, p. 30).

Remembering

Remembering arises out of silent listening. Mythic memories, dangerous memories of freedom and suffering in an individual's life surface through silence to enrich and challenge the present. Remembering the mythic figures and stories allows the teacher to recall, reclaim, reintegrate, or reject them. 'The mythic demand in remembering is the demand of facing our own pasts and our own presents, discovering in doing so that the monster is after all not our enemy' (Harris, 1988, p. 33).

Re-telling ancient stories is not enough. Teachers and learners must enter the dangerous territory of personal and communal memories of suffering and freedom: opportunities denied and doors suddenly opened; unbearable losses and healed

relationships; slavery and rights regained; irrational destruction of creation and courageous commitment to life in all of its forms.

...because we are all 'in Christ' as other aspects of the Imago Dei, we may say that anamnesis is an aspect of all teaching, especially if we believe the teaching act is a religious act. As such, it becomes a further ritual of Remembering where as teachers and learners we re-enter the past and make it our own; we re-view the lives of others and incorporate them into ours; we rediscover unspoken words and allow them to speak to us (Harris, 1988, p. 43).

Ritual Mourning

The next step in the dance Harris proposed is ritual mourning. Surfacing memories often brings tremendous feelings of loss, pain, and rage. Engaging in a solo dance of mourning 'can turn inward, lead us to continue portraying ourselves as victims if we are already doing so, and keep us stuck in a pattern of denial' (Harris, 1988, p. 50). What is needed is the recognition that others have shared the experience of pain and loss. Connecting with others in communal mourning not only allows teachers and learners to find strength in dealing with their own grief, but also opens the way to societal mourning in grief over 'the suffering touching any woman, and child, any man anywhere, as well as the cosmic suffering of the planet itself' (p. 53). For Harris the heart of mourning is grief over the absence of justice.

Rituals of mourning allow those who grieve to walk down the passageway from remembering to imagining a new way of teaching and learning and living. Religious traditions provide rituals of mourning that can be re-cast to fit the need or new rituals can be developed to allow mourners to 'name the pain, face it, surface it, and then grant it burial' (Harris, 1988, p. 58).

Artistry

The dance does not end with burial. A new way of being must be envisioned; a solution discerned; a change embraced. Many would name this step 'imagining,' but Harris rejected this term. She insisted '...*Artistry* is a wider term which obviously has meaning for all the senses. (Harris, 1988, p. 61). Citing the work of Susanne Langer (1957), Harris calls on teachers to use hearing, touch, space, visuals, voice, and word to help students and themselves to develop visions, possibilities, and plans to enrich their lives as well as the life of the wider community. Critical to this step is the teacher's ability to release the student, to let go. Harris said of 'release'

...it is important in the creative act of molding, as in the spirituality of teaching, where a person must say, 'I can do no more,' and where the appropriate thing to do is to let go. To do otherwise is to claim time – a

present and a future – which is not ours to claim. For the other is on her or his own, and the movement now demanded of the teacher is the cessation of movement, or rest, or emptiness (1988, p. 74).

Birthing

The next, but not the final step in Harris's spirituality of pedagogy is birthing. This step 'envision[s] a learner as an elemental force, bearing within the power to recreate everything: the self, the universe, God' (Harris, 1988, p. 77). It calls the students to enter into the world of justice, not only to give birth to a better image of the self, but also, to create the necessary conditions for a just society.

Birthing demands that the teacher step aside into the role of midwife. Harris cited the work of Belenky, Clinchy, Goldberger and Tarule who in *Women's ways of knowing* (1986), describe the qualities of a midwife-teacher. Such teachers do not deposit knowledge in a student's head, but draw out what is already there. They do not anaesthetise their students, but encourage them to think for themselves, to speak in their own authentic voices. The first concern of such teachers is 'to preserve the student's fragile newborn thoughts, to see that they are born with their truth intact, that they do not turn into acceptable lies' (p. 218). Midwife-teachers know that their students' knowledge is their own and that their job is 'to put the students into conversation with other voices—past and present—in the culture' (p. 219). Finally, midwife-teachers open students to the possibilities of using their knowledge in daily life.

Building on these concepts, Harris proposed that 'the role of Midwife is the community's, even more than it is that of the individual teacher' (1988, p. 83). The demands of justice require the broader community whether it be the local school or the central government to shape the societal environment so that it can and does facilitate the activity of birthing.

Harris does not recognise birthing as the *final* step. She said, There is no last moment. Instead there is a continuing dance and a continuing rhythm, where artistry blends into remembering as well as into birthing, where mourning appears in the midst of silence as well as remembering, and where silence itself belongs to all other themes (1988, p. 90).

Maria Harris's dance does not end. It may pause to take time for peace and reflection, but only that it may begin again.

Knowing

Citing an over-reliance on psychology throughout the 20th century, Harris challenged the equating of knowing with one form of knowing, the cognitive dimension. In particular she questioned the adequacy of cognitive faith development theory. She raised the following questions in 'Completion and faith development' (1986):

1. Does cognitive faith development draw exclusively on verbal, discursive responses?
2. Does it force hierarchical and/or linear imaging of faith?
3. Does it implicitly teach that human faith is an overwhelmingly rational reality?
4. Does it miss the shock of the new?
5. Does it prejudice alternative interpretations and push the idea of a *final* interpretation?
6. How essential are the assignments of certain stages to certain ages? (pp. 120–122)

Harris found in the answers to these questions a case for asserting the necessity of attending to the aesthetic dimensions of knowing and learning. She saw ‘the aesthetic with its avoidance of any one answer as *the* solution and its susceptibility to multiple interpretations’ (Harris, 1979, p. 143) as a corrective to the issues raised in an examination of cognitive theory. However, she warned, ‘...dealing with the aesthetic, the artistic, the non-discursive is NOT a denigration of the world of discourse and rationality, but a complementing of it...’ (p. 150). Indeed, Harris saw aesthetic knowing as the completion of knowing.

Throughout her work in this area, Harris acknowledged her debt to Susanne Langer who in *Philosophy in a new key* (1969) described a way of knowing that employs non-discursive words, sound, silence, stone, wood, color, line, shape, and the human body itself to discover and express in symbol and metaphor those ‘unspeakable’ realities which reside in mystery, integrity, and uncertainty and resist dissection and categorisation (Harris, 1986, pp. 117–119).

Outlining a course in the aesthetic dimensions of religious education, Harris (1979) discussed three conceptual poles around which the course was organised: word, world, and wisdom (pp. 147–150). ‘Word’ refers to the presence, or absence, of verbal symbolism. While discussion of concepts is usually a component of the course, it is presentational symbolism, realised through poetry, drama, literature, and silence which constitutes the verbal heart of the curriculum. ‘World’ invites students into relationship with the stuff of the earth: clay, paint, water, nature, bodiliness. Its purpose is to break through ‘our everlastingly talkative ecclesial circles’ into conversation with the natural elements of life (Harris, 1979, p. 147). ‘Wisdoms’ refers to the learnings that emerge from the course. In ‘A model for aesthetic education’ (1979), Harris identified four wisdoms that seem most significant:

1. Foolishness—which teaches the students that not all knowledge is of practical use; that the more than rational exists and nourishes human life; and that trying something in which the learner is not expert teaches valuable lessons in humility and fitness.
2. Creativity—which calls for detachment from the outcome, passion, immediacy, deferral of satisfaction, yielding to the process and the material.

3. Wholeness—which affirms a sense of integration nourished by ‘encountering the materials universe, and working in the intuitive, the imaginative, and the perceptual modes more proper to art’ (p. 150).
4. Worship—which invites the students to acknowledge dependence on the divine and on one another.

Harris’s challenge to religious educators to embrace art as ‘the primordial form of knowing through our bodiliness’ (1986, p. 120) relates strongly to her conviction that the dance never ends and that the answer is never final.

Community

Community of the Way

In naming the two goals of religious education as teaching a way and teaching to understand religion (Harris & Moran, 1998), Harris identified two communities to be formed and promoted through religious education. The first is a community of believers who embrace a particular ‘way’ and teach others ‘how to live and how to die by embodying this religious ‘way’ through a set of beliefs, symbols and rituals’ (p. 44). Harris posed three questions for religious educators trusting that the answers would illumine the nature of the community and the most effective ways of transmitting and sharing it. Her questions were: what is living; what is dying; what is rising? She answered these questions from her own perspective as a Catholic Christian in hopes ‘that *mutatis mutandis* – the necessary changes being made – others might do the same in their respective religious homes’ (p. 44).

What is living in the Catholic Church today? Harris responded

1. that it is becoming a church of the laity;
2. that it is marked by a hunger for spirituality;
3. that the spirituality that is being sought is connected, relational and communal in character, placing justice in a privileged place;
4. that catechists are called to the role of midwives;
5. that eucharistic spirituality is at the heart of it all.

She asserted the final point in the face of the crisis in priestly ordination by noting the sacramental consciousness of Catholics throughout the world and by proposing that, ‘For, although eucharistic *forms* are changing, eucharistic *essence* is not’ (Harris & Moran, 1998, p. 47).

In answering the second question, ‘What is dying?’ Harris pointed out the following:

1. that current structures are dying;
2. that assumed privilege has given way to a call for justice for the poor, the marginalised, and the disadvantaged;

3. that privilege without responsibility is no longer acceptable;
4. and finally, that a whole generation is moving toward death.

She urged religious educators to add to their roles of teacher and midwife the role of mourner for all that is dying and all who are dying. 'The role of mourner means that in the face of loss we must do what hospice workers are taught to do: show up, pay attention, tell the truth, and ignore worry about the results' (Harris & Moran, 1998, p. 52).

The 'sense of the faithful' is what is rising for Harris. She referred to the *Encyclopedia of Catholicism* for a definition of the term

The sense of the faithful is the intuitive grasp of the truth of God that is possessed by the church as a whole as a consensus. It is active discernment, a power that belongs to the body of the faithful in response to God as Spirit (quoted in Harris & Moran, 1998, p. 53).

She also found the tradition of the cosmic Christ present in the whole world, human and non-human rising. She pointed out that the resurrected Christ does not exhaust the reality of the resurrection.

But because he didn't – and doesn't – rise alone, Christians fill up what is wanting in Christ even as they acknowledge that there are other religious communions. We are at best *a* people of God, and not in possession of the fullness of truth (Harris & Moran, 1998, p. 54).

In helping to form a community of the 'way,' religious educators must serve as witnesses, and perhaps martyrs, to this task.

Community of Understanding—Feminism

Harris's assertion that the community of the 'way' is *a* people of God, not *the* people of God, points to the inclusiveness of her vision. Starting from the liberation perspectives of feminism, she critiqued her own Catholic tradition, as well as the canons and practices of the field of education. She wrote that 'Experience as we usually write, teach, study about, and conceptualise it, is that of white men, more specifically, powerful white men' (Harris, 1986, p. 122.) Her focus on women and the cultivation of authentic voice in women and girls arose from her participation in the work of developing a feminist approach to religious education. Rosemary Radford Ruether (1983) proposes that

The critical principle of feminist theology is the promotion of the full humanity of women. Whatever denies, diminishes, or distorts the full humanity of women is, therefore, appraised not redemptive. Theologically speaking, whatever diminishes or denies the full humanity of women must be presumed

not to reflect the divine or an authentic relation to the divine, or to reflect the authentic nature of things, or to be the message or work of an authentic redeemer or a community of redemption (pp. 18–19).

This critical principle resonates with Harris's insistence that educators play close attention to implicit and null curricula, engage in the process of surfacing dangerous memories, and engage in acts of ritual mourning arising from the grief and loss related to those memories.

Maria Harris urged educators 'to break the silence that surrounds the terrible, terrible risks to the spirits of too many girl children in our world' (Harris & Moran, 1998, p. 77). She supported her position by citing U.N.I.C.E.F. statistics documenting not only the loss of voice among girls, but also the loss of health, bodily integrity, and life itself.

In *Dance of the spirit* (1989), Harris proposed that women *awaken* to the reality of their lives, *discover* their gifts and the communities that will support them, *create* their lives and their worlds, *dwell* in their place or leave it behind, and *nourish* not only themselves, but also those who need care in our world. In later work, she added two additional steps to the dance, *traditioning* or handing on what is best in life through parenting, teaching, mentoring, and modeling, and finally, *transforming* the face of the earth so that it will be 'hospitable to the young, the fragile, and the needy' (Harris & Moran, 1998, p. 79).

Often religious education, especially teaching the 'way,' is associated with the education of the young. Harris insisted that education must be lifelong and lifewide. Arising from her commitment to the growth of women and girls came her passion for the 'jubilee years.' In *Jubilee time* (1995), she described the lives and spirituality of women who are crossing the threshold of their fiftieth year, the biblical year of jubilee. The challenge for religious educators during these years is to mold a curriculum and develop a pedagogy that will help jubilarians to acquire wisdom, achieve wholeness, practice mature moral responsibility, and learn the way of detachment (Harris & Moran, 1998).

Harris's attention to the movements of feminism and to the important stages of her own life helped her to grasp the importance of two other great concerns: ecumenism and ecology.

Ecumenism and Ecology

Early in her childhood in New York City, Maria Harris came into close and loving contact with Jewish neighbors who reached out in compassion to her family when her father died. Her experiences at Union Theological Seminary and Columbia University enriched her experience of Christians of various denominations and Jews of various traditions. In describing Harris' ecumenism, Dorney wrote: 'Her teaching experiences overseas, in places such as Australia, Bermuda, New Zealand, and Korea, continues to deepen her perspective that religious education is what all people do to honor and extend religious presence in their midst' (1997, p. 182).

Her ecumenism did not wear the smiling face of religious toleration, but the determined face of the learner who truly values what others have to teach, and the prophetic face of an enraged Jeremiah who thunders in the face of injustice. In *Women and teaching* (1988), Dr. Harris challenged religious educators.

In Christian educational circles, for example, we have yet to re-member in any integrated way that great fissure of evil crossing the twentieth century, the destruction of European Jewry—more specifically, the Christian preparation for, participation in, and responsibility toward our Jewish brothers and sisters—before the holocaust and since (pp. 40–41).

References to the religious insights of Buddhism, Islam, Orthodoxy, Protestant traditions, and nature religions enrich her work. She was convinced that ‘God emerges in Buddhist, in Sikh, in Hindu, in Muslim, and especially in Jewish tradition...’ (Harris & Moran, 1998, p. 54). She was particularly aware of the contributions of Native Americans and the aboriginal people of Australia to contemporary spirituality. She wrote

Earth, water, fire, wind: these were ordinary realities that impelled us to awe. With modern industrial practice, however, many of these ordinary spheres of life have been injured and, along with the pollution of water and the dissolution of part of the ozone layer, we have lost the wisdom that directed us to look for holiness in our environment (Harris & Moran, 1998, p. 110).

Thick listening to the words and the silences of native peoples are helping industrialised people recapture their sense of the numinous in nature. ‘Today, indigenous people are helping the rest of us to discover the living water in our own lives and communities through a renewed spirituality’ (Harris & Moran, 1998, p. 110).

Spirituality demands justice, according to Harris. Justice includes paying attention to the interconnectedness of every atom on this planet. She was fond of saying, ‘Justice means we find out what belongs to whom and we give it back’ (Harris & Moran, 1998, p. 128). Along with the need to redress the imbalances in material wealth, education, and decision-making power, Harris challenged all people to ‘give back’ integrity and fecundity to the land, the seas, and the air.

Conclusion

Maria Harris’s contributions to religious education have been greater than this essay can suggest. Her theoretical work has proved profoundly practical. Classes in the aesthetic dimensions of religious education have proliferated. The steps of her dance from silence to remembering to mourning to artistry to birthing have been used in weekly meetings designed to intervene in the lives of at-risk students. The exercises in *Fashion me a people* (1989) and *Jubilee time* (1995) have provided the structure for parish and small community discussions. Her written work was complemented by her presence, by the model of enthusiasm, serious reflection,

unending compassion, and grace-filled humor that her students, audiences, and colleagues always met in her. That presence shone most brilliantly in the last years of her life when she struggled through a degenerative illness to connect, to continue to dance, and finally, in a grace-filled model of artistry, to let go. Maria Harris died on February 1, 2005. Her students would say, 'too soon;' she would say, 'just in time with the dance of the spirit.' In her death she reminds us that there is no 'final' word – the dance continues.

IT TAKES MORE THAN ANGELS: THE LEGACY OF SOPHIA LYON FAHS TO RELIGIOUS EDUCATION

Lucinda A. Nolan

Religious Education and Catechetics, The Catholic University of America

Introduction

And now our generation is yearning with a new hope. We realise we must somehow live together as one world-community without wars, negotiating our differences rather than forcing the weaker party to submit to the stronger. Mutual understanding must replace prejudice. Trust in one another's word must replace suspicion. Accenting our common aims must replace exaggerating our differences. Seeing good in our enemies must be substituted for seeing only evil. Honesty must take the place of deceit. Study of the things that make for peace must supersede study of the things that make for war. We must learn ways to encourage people rather than ways to vanquish them. (Sophia Lyon Fahs, 1952, p. 143)

These prophetic words were written over fifty years ago by Sophia Lyon Fahs (1876–1978), a noted religious educator, lecturer, speaker, author and editor whose career spanned nearly three quarters of the twentieth century. Her progressive, creative and liberal ideas concerning the religious education of children have shaped the educative practices of many Christian denominations. Her long and distinguished career led to international recognition as a pioneer and innovator in the religious education of children. Because much of her work was translated into other languages, including Japanese, Turkish and Esperanto, her influence has been much more global in its effects than that of other educators of her time.

Fahs reacted against religious education as mere transmission of doctrine and children's schools of religion as solely Bible schools. She challenged religious

educators to make full use of the child's curiosity and sense of wonder and cautioned them to refrain from presenting complex scriptural notions before the child is developmentally capable of such an task. A great observer of children, she became aware of the questions that were of concern to them and fashioned her lessons around their interests. No topic, in Fahs's view, was outside the realm of religious education.

Like other Protestant liberal religious educators of her time, including William Rainey Harper and George Albert Coe, Fahs was deeply influenced by the work of John Dewey. She saw religion, not as something to be added to experience, but as a component of all experience, to be discovered and explored through a process of reverent inquiry. A vital religion was a matter of the totality of all experience. The aim of religious education, in her thought, was to help others recognise the religious dimensions of even the most ordinary of human experiences.

Longing to improve the education of children in church schools, Sophia Lyon Fahs envisioned a comprehensive curriculum for children's religious education that would build on the natural cycle of growth and development of children rather than on Bible memory work. Fahs thought that church schools which introduced doctrinal and scriptural materials to the young too soon impaired the child's ability to develop his or her own religious sensibilities and to appreciate the values inherent in other religions. In her view, even the youngest children had religious experiences of their own that were the very foundations upon which a mature religious outlook could be built. 'Would it be possible to build the curriculum of a Sunday school around some of these experiences, so real to children, so important to them, and yet so universal, shared by all the children in the family of man?' (Hunter, 1966a, p. 38). The result of such a process would be widening and deepening human sympathies toward all of God's creation leading toward the eventual transformation of human society into 'a new world brotherhood' (Fahs, 1952, p. 154) or, in today's language, a global community. Such a philosophy of religious education would involve marked changes in the usual assumptions regarding the development of reverent and worshipful attitudes in the mind.

Children need opportunities to discover in their own experiencing how our lives are intertwined, and so to have their imaginations enlarged and their empathies deepened. (Fahs, 1965a, p. 15)

Sophia Lyon Fahs realised that such a transformation would 'take more than angels' (1937, p. 153). It meant nothing short of a reformation in religious education. It would necessitate reconciliation between science and religion. It would mean a reexamination of religious symbols and traditions in light of new historical scholarship. The new discipline of psychology needed to be applied to all aspects of the child's life, including the church school classroom. It would require no less than the noblest and most courageous of efforts of all those concerned with the religious growth of children: parents, families, teachers, schools, congregations, and communities.

A Lifelong Religious Quest

Sophia Blanche Lyon was born in 1876 to Mandana and David Lyon, Presbyterian missionaries who as newlyweds had decided to accept a mission field in Hangchow, China. Their faithful spirit and dedicated sacrifice to their chosen vocation had a lasting impression on young Sophia who came to understand that her parents' 'devotion to goals beyond their own personal fulfillment was a priceless part of her heritage' (Hunter, 1966b, p. 7). For many years Sophia, caught up in the missionary enthusiasm of the time, dreamed of becoming a missionary (Hunter, 1966b, p. 42). While her educational pursuits were toward this goal, she later became critical of the exclusive claims of Christian supremacy inherent in some missionary tactics.

After graduating from Wooster, a small Presbyterian College in Ohio, Fahs enrolled in scripture courses in the new Higher Criticism at the University of Chicago under the tutelage of William Rainey Harper and Ernest Burton DeWitt. The ideas put forth by these two professors exhilarated young Sophia. She began to gradually discard the evangelical religion of her childhood as she was drawn more deeply into modern Protestant liberalism. At the turn of the century, there were the stirrings of new theological undercurrents in the United States. These currents were put into motion by insights from historical criticism, the new science of psychology, and modern pedagogical practices. The religious imagination of Sophia Lyon Fahs was like a sponge absorbing both liberal theology and the progressive philosophy of religious education.

In 1902, Sophia Lyon married Charles Harvey Fahs, the newly appointed editor of the Methodist monthly, *World Wide Missions*. As his wife, Sophia had the opportunity to meet missionaries from all over the world, to make use of the Missionary Research Library, and to share her husband's interest in religions of the world and cultural anthropology. Consequently, her work in religious education and curriculum design became more ecumenical and inclusive over the coming years.

Sophia Lyon Fahs studied elementary education at Columbia University's Teachers College where she taught in the experimental Sunday school. One of her professors, Frank McMurry, whose teaching emphasised the primacy of experience in childhood education, introduced Fahs to the field of religious education and the progressive thought of John Dewey (Hunter, 1966b, p. 58). McMurry's teaching and Dewey's understanding of education as the reconstruction of experience inspired the young teacher, and she immediately began putting these new ideas to work in her classes. Years later, Fahs recalled:

John Dewey's dynamic propositions were not simply congenial to my own thinking, they motivated me to pursue their implications in the total process of learning how to live valuably (religiously) in the natural world. They also impelled me to test their potential and to raise devastating questions regarding the common ways of seeking the religious development of children. (1965b, p. 3)

While Fahs never personally studied with Dewey, he became and remained the single-most influential figure in her work and writing.

Through her work with Frank McMurry at Teachers College, Fahs became affiliated with the Religious Education Association. Her philosophy of religious education embodied the association's founding principles, and she shared its emphasis on historical biblical criticism and concern for reconciling science and religion. She wrote extensively over several decades in the association's journal, *Religious Education*. In 1972, the General Secretary of the Religious Education Association described Fahs as 'one of the truly great pioneers of religious education in the 20th century, in the company of Harrison Elliott, Frank McMurry and George Albert Coe' (Kathan, 1972, p. 6).

In 1923 Fahs enrolled in the Bachelor of Divinity program at Union Theological Seminary where, upon graduation, she was appointed as one of the first two women on the faculty of religious education. Having already made a name for herself in the field as an author and innovative teacher, Fahs blossomed under the progressive, liberal administration of UTS. Her tenure was, however, not without its share of controversy, and Fahs proved a formidable opponent to those who would challenge her heavy emphasis on the centrality of human experience in both theology and education. The tensions between Modernists and Fundamentalists were at their height in the 1920s, evidenced especially in the public arena by the Scopes trial of 1925. Union Theological Seminary and Fahs were deeply embroiled in the controversy. 'If the first two persons of the demonic trinity enthroned at Union Theological Seminary, as far as the Fundamentalists were concerned, were Modernism and the Social Gospel, the third person was the new religious education' (Hunter, 1966b, p. 158).

By the 1930s, Sophia Lyon Fahs had become a recognised leader and a rare woman author and speaker in the field. Her wealth of experience in church school education, supervision and administration brought her national and international recognition as an expert in the field of the religious education of children. In 1937, at the age of sixty-one, Sophia Lyon Fahs was named Editor of Children's Materials for Unitarian religious education. Under her editorship *The New Beacon Series* became a landmark curriculum for many liberal church groups and was translated into several languages, parts of it still in use today. In 1959, at the age of eighty-two, Sophia Fahs was ordained a minister in the Unitarian Church. Her legacy has been described as a 'New Ministry to Children' that included the call to move away from transmissive, authoritarian teaching toward an experientially based study of religion that would allow for the child's natural developmental process of learning and growth and the incorporation of new findings in all disciplines of modern scholarship (Beck, 1978, p. 714). As she experienced the many religious transitions of her life, from evangelical Presbyterianism, to Methodism and later to Unitarianism, Fahs's religious thought broadened and she grew to understand that religious education must occur in a global context, with the aim of producing a peaceful, universal community. Her long career in religious education left a lasting legacy of the centrality and importance of allowing for the natural development of religious sensibilities in children.

A Creative and Courageous Philosophy of Religious Education

The sense of teaching as a vocation involves a measure of determination, courage and flexibility rather than a sense of heroism. The teacher's calling is sustained by a sense that the work of teaching is an activity whose meaning is larger than the sum of its parts. (Durka, 2002, p. 7)

Sophia Lyon Fahs, the teacher, demonstrated a continuing concern and love for children, a remarkable measure of courage, and a great deal of imaginative creativity throughout the course of her long and distinguished career. Her work serves as a model of a religious education that has at its core the hope of world transformation (Nolan, 2004).

Fahs's belief that religion is not something to be added to the child's experience but rather a quality of all their experiences led her to view teaching as a sacred activity. Few since have shown such courageous dedication in pursuit of educational reform. Fahs sensed that what she was working to achieve was well worth the struggle and that she would need others of like heart and mind to join her in pursuit of a new kind of ministry with children.

Challenged by both evangelical and neo-orthodox thinkers, Fahs maintained a liberal theological perspective and a progressive educational outlook throughout her life. While she accepted the criticism of being overly optimistic about human nature, she sought to balance the naïve liberalism of progressivism with a measure of realism in her work. Fahs remained steadfast in her belief that a transmissive religious education was harmful to the child's unfolding and fragile sense of religion. Children should have the opportunity to develop their own concepts of God before doctrinal formulations were imposed upon them, even by well-intended parents or teachers. 'Fahs observed that genuine religion grows proportionately as children experience the passions and problems that comprise 'growing up;' that genuine religion constitutes a questioning spirit that searches sincerely rather than some systematically expressed, divinely inspired truth' (Chandler, 1989, pp. 542–543).

Sophia Lyon Fahs's willingness to experiment, test and evaluate methods and curricula of religious education was unprecedented. Her attention to detail is reflected in the observational records kept by the teaching staff throughout the years she was principal of the Union School of Religion. Fahs's *Exploring Religion With Eight-Year-Olds* (1930), written with Helen Firman Sweet, is a detailed class record of a year's worth of Sunday school lessons. Her work in testing and evaluating methods and texts for the classroom are hallmarks of her legacy.

At the heart of Fahs's approach to religious education were the children's deepest questions about the mystery at the centre of all life. For her, freedom and growth as the values behind the transformation effected by education were gifts of the Creator freely offered to all humans. The full use of these gifts, which demands inquiry and thus education, is the aim of all education. Growth, learning and transformation are its fruits.

Considering education as the practice of human freedom, Fahs understood that it led to the 'abundant life.' Deeming herself 'a reverent agnostic,' she believed that

children can know enough about God to begin to construct their own philosophies of life—even theologies—that will gradually become the sufficient foundation for a life that flourishes even in tumultuous times. She contended that the imaginations of teachers and students are engaged and heightened in the process of such a transformative education as their experiences deepen and widen through intellectual inquiry. Within the depths of any experience, the religious dimension may be discovered.

Relationships are central to the process of social transformation in education. Fahs believed that as children grow and develop emotionally and intellectually, the number and complexity of their relationships should naturally increase and become more and more inclusive. There is a natural rhythm to Fahs's pedagogy, dictated ultimately by the developing child, but also orchestrated by the engaged, imaginative and professionally trained religious educator who journeys with the child toward Creative Mystery. Life-long religious education leads the human person to live as a free and responsible member of 'a world brotherhood'—or global family—able to cope realistically with all problems and challenges this will naturally entail.

Fahs also understood religious education as life formation that begins with the very earliest experiences of the child and continues in many forms in and outside of the church school setting. She believed that education should offer learners experiences that lead them to understand, value and exercise personal and responsible freedom in life. Religious education should give children the courage to welcome life and trust in its potential goodness even in the face of suffering and tragedy. The classroom was, for Fahs, a microcosm of democratic life.

Fahs held that religious education led to social transformation when the teaching-learning process fostered connections between learner, teacher and the world. The engaged teacher is imaginative in constructing learning experiences and is sensitive to the developmental stages of the learners. Fahs acknowledged a natural rhythm to teaching and learning—a slow, gradual response in which wonder and awe continually generate new questions and activities for the discovery of answers that will, in turn, lead the learner toward greater wonder and deeper questioning (Nolan, 2004).

Religious and spiritual growth, according to Fahs, occurred naturally as a result of this creative way of doing religious education. She noted that this form of ministry had the potential to bring about such transformations in the child as: (1) Learning to think 'on one's own' about the things that matter most in life; (2) Forming the habit of weighing fairly and objectively others' interests and needs along with one's own; (3) Learning to make choices on the basis of what will bring to all the human beings concerned greater happiness and richness of life; (4) Increasingly appreciating beauty in nature, music, art, and people; (5) Interpreting the ever-new experiences of life in terms of opportunities for co-operation with God in building a better world (Bridgman & Fahs, 1925, p. 106). Observing, recording and evaluating such transformations in student attitudes and behaviors was a unique contribution to the field made by Fahs and her associates in experimental religious education.

While Fahs's philosophy of religious education was grounded in her liberal theology, it was also rooted in her deep reverence for Christian missions and

the truths inherent in other world religions. Daniel R. Chandler wrote in a commemorative article for the journal, *Religious Education*:

Fahs's educational philosophy stemmed from her religious experience. Stressing a pertinent and purposeful religious education that nurtures modern children, she rejected emphatically the outdated, archaic, detrimental techniques that characterise authoritarianism and evangelism. Clearly she demonstrated an essential consistency between her religious philosophy and her educational methodology. (1989, pp. 546–547)

Furthermore, her educational philosophy was shaped by her personal experiences with children, her own and others. Chandler addressed this facet of her thought: 'Growing through her personal experiences, Fahs struggled to satisfy her children's physical and religious needs. The problems she encountered as a mother nurtured her religious and educational philosophy' (1989, p. 540). Her children were her teachers and she viewed those years of family life as an internship that influenced and shaped her career as a religious educator of youth.

Children continued to hold fascination for Fahs who was still teaching and supervising in the school of religion at Riverside Church when she was fifty-six years old. Here she developed an experimental class for nine and ten-year olds, spending long hours on research and record keeping. She wrote, 'I am struggling to see if these children can be stimulated to appreciate some unseen values...which make religion necessary' (Hunter, 1966, p. 210). Though the class was not entirely successful in terms of all Fahs's goals, the experience validated her creative approach to the religious education of children.

The New Beacon Series: The Culmination of A Life's Work

In 1937, at the age of sixty-one, Sophia Lyon Fahs was invited to fill the position of Editor of Children's Materials for the Unitarian Church of the United States (Hunter, 1966b, p. 197). She brought to Unitarian religious education a lifetime of experience in the religious education of children. The curriculum she edited over the ensuing years was nondenominational in nature and was in large part personally overseen or written by Fahs herself. The series was a culmination of her life's work, weaving together liberal theology, progressive educational philosophy, science and nature, psychology and child development theory, mysticism and historical biblical criticism. The success of *The New Beacon Series*, edited by Sophia Lyon Fahs from 1937 to 1964, was due at least in part to the cohesiveness of the theology and philosophy of religious education underpinning it. As Randolph Crump Miller observed,

'Theology...must be the presupposition of any curriculum.... [This] means that the educators must become theologians, and the theologians must become educators, and the writers of lesson materials must be grounded thoroughly in both educational theory and theological method. (1955, pp. 10–11)

Concurring with Miller, David Parke wrote in the conclusion of his dissertation that *The New Beacon Series* was successful for several reasons including the fact that (1) a consistent, articulate, and appropriate philosophy of education underlay the series; (2) the books in the series were written for children of particular ages, and were use-tested with children's classes prior to publication in order to insure their interest and relevance; (3) a fine balance was worked out between life-situation teaching employed with younger children, and didactic teaching—employed with children of seven years and older who were capable of identifying with persons beyond their own peer group (1965, p. 377).

The New Beacon Series was distinctly different from the uniform, pamphlet-style, graded lessons of other denominational Sunday schools. The series consisted of books that were to be read by or with children, each with an accompanying teacher's guide. Subject matter included nature, child growth, family life, world religions, lives of religious founders, creation and science. Older children began their study of Jesus and the Bible around the age of ten. At age thirteen, students might read such titles as *The Church Across the Street* (Manwell & Fahs, 1947), *Questions That Matter Most—Asked By the World's Religions* (Ross & Hills, 1954), and *War's Unconquered Children Speak* (Cobb, 1953).

Speaking of her approach to religious education, Parke cites Angus MacLean addressing Fahs: 'I think you are the most important thing that ever happened to liberal religion, for you gave a bony structure to its uncertain body-form and support as well as muscle for strength and mobility in pursuit of purpose. You gave it its one great corporate expression' (1965, p. 377). This corporate expression was the result of a lifetime's work of harmonising and weaving together liberal theology, progressive educational philosophy and practice, historical biblical criticism and the latest findings of the human and physical sciences. Few religious educators have developed both theory and practice to such an extent. Her energy to do so was based on her conviction that a 'new reformation' was afoot in religion—one that would prove to be of even greater import than the first. In Parke's view, 'whereas [William Ellery] Channing only announced a revolution, Mrs. Fahs effected one' (1965, p. 381).

Throughout her long years of work and writing, Fahs reiterated the fact that she realised what she was proposing was 'new.' She surmised:

A religious reformation has begun...The reformation is now only in its beginning. It cannot be accomplished hurriedly. In fact, if man ceases to reform his religions in light of his advancing knowledge, they will become sterile. Not only do we as adults need to enlist in this reformation, but we need to prepare our children to carry on after us. (Fahs, 1960, pp. 14–15)

Many of Fahs's proposals remained untested outside of experimental and liberal church schools. Neo-orthodox influences in religious education overshadowed and eventually brought to a halt any possibility of her methods being wholly adopted by mainline church schools. This is not to imply that her work has been discarded. Indeed, much of it laid fertile ground for further development in the field of religious

education. Edith Hunter indicated that Fahs was at least partially responsible for influencing church schools in integrating developmental theories, using bound texts rather than leaflets, cooperating with parents, incorporating a variety of creative activities and lessening Bible materials for the very youngest children (1956, p. 327).

The Unitarian Universalist Church continues to laud Fahs as one who revolutionised liberal religious education. Reverend Don Southworth of Atlanta Georgia called her 'our Religious Education saint' (2002). Another Unitarian Universalist pastor proclaimed:

A great deal of credit for the development of the discovery method belongs to Sophia Lyon Fahs, who edited the New Beacon Series of children's books for the American Unitarian Association in the 1930s and '40s. In 1959, at the age of 82, she was ordained into the Unitarian ministry, and although she died in 1978, her influence still lives on. We don't recognise saints in our denomination, but if we did Sophia Fahs would be a prime candidate. Among religious educators she's still remembered fondly as 'Saint Sophia'. (Thompson, 2001)

Many Unitarian Universalist curricula and philosophies of religious education continue to be based on Fahs's thought, and liberal seminarians continue to study her work. Denominational handbooks of religious education in many UU churches refer to the continuing influence of Fahs's ideas in their contemporary programs. One such handbook states, 'To accomplish [our mission], we utilise the research and teachings of the Unitarian Universalist religious educator, Sophia Lyon Fahs, and the Unitarian Universalist Association.' The North Shore Unitarian Church handbook calls her ideas 'prescient' and identifies the fourth and fifth grade curriculum as employing Fahs's methods. The same handbook states, 'Fahs...revolutionised the world of religious education with her fervent belief' and 'the observations of Fahs and [James] Fowler are the grounding of our philosophy of religious education.' While only two of her books for children remain in publication, her influence, particularly in Unitarian Universalist religious education, is widely acknowledged.

The Legacy of Sophia Lyon Fahs

In any retrieval of historical thought, there are elements unearthed that are no longer pertinent. This is true in Fahs's case in and in the whole of the liberal response to modernity. In many ways, though reluctant to give into neo-orthodox critiques of liberalism, Fahs transcended the classical liberal progressive ideas of many of her contemporaries. While much of her thought resonates with contemporary concerns in the field, to call her work visionary is to join a chorus of many voices who have addressed her work in the years since her death in 1978.

There is much in the theology and philosophy of religious education of Sophia Lyon Fahs to be reclaimed by subsequent generations. The effects and potentialities

of her work are greater than those realised in her lifetime. The legacy of her work remains, and her remarkable foresight concerning many prominent contemporary issues should be noted. By keeping her finger on the pulse of her times and by a deep and conscientious examination of her own experiences in education as well as those of others she was able to see with remarkable clarity what was ahead for the profession.

Fahs has relevance for today that other progressive liberals do not. This may be attributed to feminist retrievals of the historical place of women in education. Another contributing factor is the fact that Fahs left a body of work that is both theoretical and practical in scope. Providing added pertinence to Fahs's work today is her openness to other religions and the insistence on presenting a particular religion within the context of all humanity's religions. Her work is of special interest today because of her awareness that she stood on the threshold of something new in religious education that could better prepare children for the challenges of the future.

Fahs's thought anticipates that aspect of cultural postmodernity that embraces diversity and plurality. In fact her theology grew more and more universal over the years to the point of becoming, in the opinion of some who knew her, non-sectarian. She strenuously worked to include a comparative element in all the curricular materials she edited. She anticipated that the world of the future would demand understanding, tolerance and harmony among all religions. A resurgence of interest in the romantic and the mystical is characteristic of both the postmodern era and of Fahs's thought. Fahs staunchly addressed the dangers of absolutism and overriding meta-narratives such as the one she called 'The Old Story of Salvation.' Additionally, as it has been noted, Fahs advocated a reconstructive approach to those religious symbols and expressions that had been rendered outdated by new discoveries across the disciplines. These characteristics of her thought support the case for her continued relevance for today's postmodern world. While far from being exhaustive, the next section identifies seven visionary aspects of Fahs's thought.

An Enduring Vision for Religious Education

Sophia Lyon Fahs has been the subject of a number of doctoral dissertations and the focus of study by such noted religious educators as Mary Boys and M. Susan Harlow. Her contributions to the field are numerous and cannot be adequately addressed in a single chapter. Her biographer, Edith Hunter, modestly admitted that Fahs's work contributed to such developments in religious education as classroom experimentation with curricula prior to publication, development of teacher's guides, use of evaluation techniques, and recognition of and training for religious educators (Parke, 1965). Certainly, her natural theology and belief in the Bible as one sacred text among many singled her out from other Protestant educators of the day. Her concern over the point at which to begin Bible study with children was shared by many, though she stood courageously for a delay until the ages of eight or nine.

Sophia Lyon Fahs sensed an imminent danger of the church losing its young members due to conflicting methodologies used in religious education and science.

She wrote extensively on the need to harmonise the findings and processes of the sciences with religious teachings. As early as 1928, in a paper she delivered to the Religious Education Association, Fahs observed:

The deductive process in religion has been clashing with the inductive process in science. This fundamental conflict between the two types of processes, and the efforts of religion to turn about face and to travel with science are fraught with so great significance for religious education and for religion itself, that if we could visualise what it is that is coming to be, we would speak as it were with tongues of fire. (Fahs, 1928, p. 332)

The conflict of processes in science and religion leads to both intellectual and emotional difficulties for the child attempting to harmonise what is being taught at school with what is being taught by the church. Fahs believed that 'religion, to be wholesome, needs to be a fitting over-belief' (Fahs, 1942, p. 247). Youth, in their advanced level of scientific study, need teachers of religion who are well qualified to assist them in dealing with such conflicts.

Delivering The Rufus Jones Lecture in 1960, Fahs spoke of foreseeing 'young people rejecting religion in increasing numbers' and 'the moral foundations of our society crumbling' if religions are not reformed 'in light of advancing knowledge' (Fahs, 1960, p. 15). Fahs believed adults should be honest in their dealings with youth, avoiding pat answers and promoting authentic dialogue between science and religion. Claims of having all the answers and passing on religious ideas no longer held as true could be detrimental to the future of the church. Children were important members of the church and, to Fahs, the most important. She cautioned: 'We said: 'They will outgrow their childish faith. We shall let them think for themselves as soon as they are old enough to do so.' But we were too late. They thought the old religion was all we knew. Many were not interested' (Fahs, 1945, p. 8). The necessary antidote was a new type of church school, one that nurtured its young and placed their education at the very centre of church mission.

Connected to this concern for harmonising science and religion, Sophia Lyon Fahs also foresaw problems arising from an outmoded biblical cosmology and sought to reconstruct her own theology on the basis of the latest scientific views on the nature of the universe. She devoted an entire chapter in her treatise on philosophy of religious education to the topic. She observed: 'To build the beginnings of faith in God on a conception of the universe that our generation no longer regards as true is to prepare the way for a loss of respect for the Bible; and what is worse, to court a cynical atheism when the child is old enough to learn for himself' (Fahs, 1952, p. 106).

The topic is later treated by Unitarian minister, Shirley Ranck, who noted three aspects of biblical cosmology that seemed especially troublesome to Fahs. Those were: (1) the idea that creation was completed in the past; (2) the idea that there exists a dualism between the natural and the spiritual worlds that clearly elevated the latter over the former; and (3) the idea that the cosmos is controlled by a God who 'uses the forces of nature as a means of moral discipline' (Ranck, 1990,

pp. 34–35). Fahs, Ranck aptly noted, saw these three outmoded beliefs as the root of much of what ails the modern world. Fahs believed humankind was called to cooperation with the universe, not domination. An outdated cosmology led to a fragmented world-view. Ranck summarised Fahs's thought when she wrote: 'Fahs suggested that the divisive authoritarian structures that pervade our society and dominate our thinking are rooted in the biblical cosmology and morality' (Ranck, 1976, p. 605).

A third foresight was Fahs's call to church leaders and religious educators to be courageous and adventurous in the work of reconstructing traditional religious symbols, expressions and myths for modern times. 'The way of searching for new and truer insights...is a way that calls for a courageous, creative adventure, involving much sharing of knowledge and experience' (Fahs, 1955, p. 135). 'There is fear lest, in improving the structure, the foundations may be blasted. Emotional tensions run high.... Everyone, in a measure, must be a theologian' (Fahs, 1952, p. 96).

That religious organisations were so highly resistant to change was due to the emotional nature of religion itself. Fahs observed:

While we may easily discard our fathers' quill pens, their gay waistcoats and their stage coaches, we cling tenaciously to their religious faith.... We can with more difficulty, change our family patterns, our economic and social organisation, and our racial attitudes; but to change our religious beliefs touches us at the deepest levels of life and demands profound adjustments, often extremely painful to make. (Fahs, 1952, p. 5)

The religiously minded adult is responsible to the future generation. Fahs hoped that religious educators would come forth from the new generation and that they would have the courage necessary to directly face the controversies between continuity and change in the church.

A fourth dimension of Fahs's theology and a timely topic for today's religious education is religious pluralism. Fahs believed that from the youngest years and throughout life, the study of the religions of humankind not only enhanced the understanding of one's own religion but also led to a greater sense of connectedness among people of all religions. The world community, she felt, must seek to understand and accept various religious traditions as validation of humankind's common search for the divine in diverse, but life-enhancing ways. Fahs aptly noted:

Our common living room is now the whole earth. Whether we will or not, our neighbors are on the other side of the globe as well as next door. In the light of this spaciousness in our exchanges, we find it unseemly to imagine ourselves superior. The realities of our shortcomings are all too easily observed by other nations and groups. Nor can we arrogate to ourselves an exclusive religious revelation. The Scriptures of other religions are easily accessible to every scholar. Any one group today that tries to dominate the whole world by its

ideology or by military might, or by force of any kind, will eventually win only the hatred of those who are put under its power. (1952, p. 150)

Not only does such a broadening of perspective open the possibility for world community, it deepens the appreciation of one's own religious tradition and beliefs. In a chapter entitled, 'What Shall Children Study?' Fahs wrote:

Modern youth growing up in our modern world needs to find much more understanding of the world's religious history than has been allowed to any previous generation.... Indeed, the values in one's own religious heritage can never be understood or fairly appraised until one is able to compare his own with others. (1952, p. 184)

A fifth and profoundly prophetic insight of Sophia Lyon Fahs concerned the need for a holistic creation theology. Fahs's deep respect and love for the natural world is reflective of her belief in God's immanence and the revelatory capacity of the universe. The study and appreciation of nature were emphasised in religious education curricula written and edited by Fahs. In *A New Ministry to Children* she poetically wrote of the complex relationship between humanity and the universe:

The Universe has been struggling through a long evolution. We are the fruits of her millions of years of labor. Our flesh is the evolved dust of the stars. Our very life is dependent upon the continuing life and death of other creatures. Without the common green world of grasses and grains we should quickly perish. Our indebtedness is a heritage that links us to all living and nonliving things from the beginning of time. The Living Universe does not ask us to accept things as they are. She challenges us to join in creating better things. She asks us to help her improve. In our pride of human superiority, we have sometimes been disdainful of the values in things of a so-called lower order. We have talked of subduing the forces of nature to serve our ends. The Living Universe calls us to understand, to appreciate, to co-operate—rather than to conquer. An exclusively human ethic is narrow. (Fahs, 1945, p. 7)

To imagine that creation was complete and that the world was for the explicit use of humanity was inconceivable to Fahs. Nature was a pervasive and essential aspect of her curricular materials for children. God's wonders and the mysteries of life and death were to be learned through a child's experiences with the created world.

Fahs gave voice to another cause close to her heart in a sermon she delivered at her own ordination. This concern reverberated through the years in her teaching and writing, most profoundly in her last article for *Religious Education*, written when she was ninety-five years old. The central subject of concern for Fahs was the need to improve the quality of religious education for the young. The field of religious education, she believed, must seek the brightest and best of young teachers and professionally prepare them, and seminarians as well, to nurture the

religious sensibilities of children. Fahs believed 'that all theological seminaries and institutions for the development of religious leadership must give more attention to children.' She continued:

I believe that during the past as well as today Christian churches have been neglecting the children, even though Sunday Schools have been growing in size and equipment; and few theological seminaries give the education of the ministers to children their whole-hearted interest and respect...At present it takes a very strong purpose and a willingness to sacrifice prestige for a man or a woman to enter the field of the religious education of the young. Ministers in preparation should be helped to feel more keenly the critical *importance* of the children. (Fahs, 1971, p. 458)

Fahs understood the task of her vocation as 'reconstructing the processes and the content of the religious education of children in light of mankind's growing understandings' (1971, p. 458). She proposed that the study of elementary religious education be a part of all liberal churches' seminary programs. The religious education of children is today a vital aspect of Unitarian Universalist congregations. Fahs's voice has not faded away.

One final example of Fahs's work that serves as a model for today lies in the very way she chose to live out her life and career as a woman of confidence in a field occupied predominately by men. It never seemed to concern her that she was often the sole woman in a professional gathering. She conducted herself with certainty and assurance as an expert in the field, regardless of the scarcity of women. Before she married she hoped that she might do some great work for God. While she thoroughly loved the challenges of raising her children ('The children were my teachers.') she openly confessed her career ambitions to her husband. At times the demands of home life kept her from writing as much as she would like. Fahs's youngest daughter Lois Fahs Timmins recalled:

My mother was an early feminist and wrote an article on Women's Suffrage before I was born.... Our household chores were not assigned according to sex, but according to our interests and capabilities. Mother fought all her life for equal rights for women. She complained that at Union Theological Seminary the women instructors were paid less than the men instructors, and was almost fired for her protest. Our family deity was not sex-linked.... Today, I have little enthusiasm for the arguments as to whether God is male or female. (Timmins, n.d., p. 1)

Fahs would not have identified herself as a feminist nor did she become involved in specifically feminist causes or organisations. While she was determined to raise a family and to have a professional career, Fahs was also 'aware of being part of the 'new Age of Women' and she understood her right to a higher education and a career' (Ranck, 1990, p. 29). Hunter quotes a letter Sophia wrote to her future husband:

I am too ambitious to serve the women of some heathen land, to be a nonentity for the direct work of foreign missions that some wives seem to be. I am too ambitious to give my life in direct foreign missionary work, to give twenty years of the strength of my life in service at home as my mother has done. Such lives count a great deal, but I long for the other. (1966b, p. 42)

In 'A Feminist Look at the Theology of Sophia Lyon Fahs' (1990), Shirley Ranck culled out many feminist tendencies in Fahs's thought. Specifically, Ranck noted that at an early point, Fahs connected patriarchal scripture with an exclusively masculine image of God. Perhaps Ranck was referring to the following passage from Fahs's *The Old Story of Salvation*:

The biblical records all came out of a type of culture that was autocratic and patriarchal. The father in the household, the chieftain of the tribe, and the head of the nation—all ruled in their respective circles with an iron hand. Even the father expected absolute obedience from his children, and had to the power of life and death over them. It would have been unthinkable in those times for men in such a culture to think of God in any other way than as lawgiver and judge. It is indeed only very recently that this general conception of relationships in the home and in the nation has been questioned or much changed. Even now the authoritarian pattern in home, society and government is far more prevalent than the more flexible, mutually-respecting pattern of democratic relationships. (Fahs, 1955, p. 135)

Sophia Lyon Fahs is remembered today as one of the leading women pioneers in the field of religious education. Though her focus was on the religious education of children and not on the various social movements of her day, Fahs was not unaware of her impact as a woman on the field. At her ordination ceremony, Fahs remarked:

Even though I am glad that the feminist element in this ordination has not been primary, I find an exhilaration tonight in being a woman and in being able therefore to act as a kind of representative of all the other women who are now ministering faithfully week by week in our liberal churches. (Fahs, 1959)

According to M. Susan Harlow, 'her thinking, writing, teaching, and resource editing all provide threads that contribute to a constructive feminist religious education' (Harlow, 1997, p. 23).

Conclusion

For Sophia Lyon Fahs, painful dialogue and imponderable questions were lures into the realm of growth, learning, religious maturity and a life well lived. Moreover, the search for the meaning and mystery of the Divine working in the world was in and of itself a religious experience. Her theology is a legacy to her openness to freedom and dynamism in the processes of human growth and learning. Fahs's thought

makes an easy transition into the revisionist era because of, what had become for her, a natural and ongoing process of critical reconstruction.

Sophia Lyon Fahs's ability to read the signs of her times and to re-examine and revise outmoded theological understandings are hallmarks of her legacy. Her courage and willingness to venture into new realms of experimental methods colored the development of her theology and philosophy of religious education. Ministers, religious educators, theologians, teachers and parents will continue to benefit from reading her work. To recall that the past is always a part of the present and that tomorrow's children are a part of yesterday's heritage should inspire religious leaders to critically examine both *what* the children of today are learning and *how* they are learning it. Fahs knew that

this reformation, if it is not to be muffed or thwarted, is going to demand degrees of courage, wisdom, insight and creatively original thinking beyond anything that any of us can imagine today.... Over and over again we need to bring children into our midst, as did Jesus for his disciples, not only for their sake but for ours as well.... Such changes cannot be brought about successfully without perceptive and knowledgeable leadership...developed in planned centres for observation, experimentation and evaluation and internship learning in direct experiences. (Fahs, 1971, p. 458)

In the years before her retirement Sophia Lyon Fahs's efforts were directed toward this reformation. She hoped liberal churches, colleges and seminaries would be establish such centres for the development of leadership in religious education. This was the vision of Sophia Lyon Fahs: that religious education might begin to transform the world, one individual at a time, toward the dream of an international and interracial community of good will. She fully realised the magnitude of the enterprise and that it would 'take more than angels.' She also knew it begins simply, by putting a child in our midst.

THE EDUCATIONAL SIGNIFICANCES OF SPIRITUALITY IN THE FORMATION OF FAITH

Joyce Bellous

McMaster Divinity College, McMaster University in Hamilton, Ontario

Introduction

I will explore conceptual relationships among the terms faith, spirituality and education to show how faith operates in human lives. I will argue that exercising faith is an existential necessity, that the spiritual is broader than the existential since the former term includes a concept for God, whether or not it is favorable, that the spiritual aims to balance integration and individuation, and that understanding faith spiritually enhances relational consciousness so that we are more able to unify the needs to individualise as well as to integrate ourselves within our general environment.

Faith as an Existential Necessity

Every human being requires an education in faith. Faith must grow up if people want to be well. Two aspects of the term influence education: the noun faith and the verb to believe. The noun and its adjective are expressed in the following sentences: The faith of her parents is Christianity. She is a faithful person. The second aspect is conveyed in the sentence: He believes in God. The second sense is an activity: it is an exercise of faith. Faith as noun or adjective is the confidence, reliance or conviction we place in someone or something. In its exercise, faith becomes an attitude of the heart, i.e., a disposition. People who exercise faith can be counted on to act in certain ways since placing confidence in a person or things alters thought and action with respect to that person or things and to the world in general. As a result, exercising faith is as changeful as is physical exercise.

Faith refers to content and a way of life. As content, faith is intellectual assent, which implies that a person holds consciously chosen statements about the world.

These statements, or deep assumptions (Kegan & Lehey, 2001), may be any of the following:

- Look out for your self! No one else will do it for you.
- No one else can tell me what to do.
- I am a person of hope.
- I must fight to be heard!
- No one will ever hurt me like that again.
- I must continually act in order to have value.

In general, those who give verbal assent to deep assumptions act accordingly to implications of the statements they prize. I say generally because a dynamic of faith's exercise is caught in the relationship between what people say they affirm and what they actually rely on. Affirmation implies intentionality. Yet there may be deep cleavages between what we say and what we count on when the going gets tough. Observing our own faithfulness (and its failures) means noticing congruity between what is said and what is done, continuity more elusive than we like to admit, but which constitutes the spiritual work of growing up. Putting faith in deep assumptions consciously and participating in their revision is the spiritual work of growing up.

Every human being has a capacity for doing spiritual work and thereby exercises faith. There is an agent—the person that exercises faith. There is the relation between the agent and the object. Suppose a young child exercises faith in her mother. As they go for a walk, they come to a playground. The little girl indicates that she wants to play on the slide. She climbs up the steps. As she sits at the top, her mother stands at the bottom of the slide. The mother looks steadily at her daughter and says she will catch her little girl. The child fixes her gaze on her mother's face. The little girl glances down the slide and is afraid but looks back to the familiar face and pushes away from her safe resting spot, keeping her eyes on her mother. Her mother catches her. The relation between mother and child is carried through their mutual gaze and expressed in their shared joy at success. Faith addresses fear. Faith is the opposite of giving in to fear. Faith tries things out, and failing or succeeding, goes on trying. While it may be possible to avoid slides in a playground, every human being learns to exercise faith. We put faith in our trust or in our mistrust of other people. This girl is likely to put faith in trusting others.

We learn about faith as infants. Consider an infant who plays a game of peek-a-boo with his father. The father, the game and the baby constitute an activity in which the infant is learning that his father exists even though the baby can no longer see him. As they play the game the baby learns to have faith in things unseen. Faith is active when we cannot make use of our five senses. Faith is the consequence of experimenting with trust. We put faith in something or someone with the result that we acquire certain beliefs about the world. If conditions are favorable, beliefs form about the world encouraging us to exercise trust rather than succumbing to fear and refusing to trust in anything that we cannot see, smell, hear, taste or touch.

People are compelled to put faith somewhere. Some put faith in a story that life will always disappoint them. Some even put faith entirely in themselves, or more accurately, in a snapshot – an image of themselves they make into an idol. But we all inevitably exercise faith. We have faith that the sun will come up tomorrow and that the seas will stay in place. We put faith in the roof our heads and that the weather will bring sun and rain to make the fields produce food. We put faith in other people. If we did not put faith in ordinary things (existential necessities) we would not have the energy to go on living. People who cannot put faith in the predictability and orderliness of the world are unwell. They become neurotic or psychotic. They are overwhelmed by anxiety and crushed by the demands of living. Faith speaks to anxiety. Faith is built into reality and affirms the wisdom of putting faith in the predictable length of days and seasons, in rain falling to water the earth and in the sun shining to warm it.

Faith is an attitude that integrates the experience of a whole person – an entire self. In its integrative role, faith influences action due to the way it organises the perception of experience. Integration is an ambiguous term. It refers to integrity in one's life: a capacity to weave together threads of experience into a whole pattern, evidenced in continuity between faith's content and its exercise, organised into a story that makes sense and integrates experience. Faith

does not create new things but it adds a new dimension to the basic realities of life. Faith brings our fragmented personality into a meaningful whole and unifies our divided self. It is the source of inspiration for a searching mind, the basis for a creative community and a constant incentive for an on-going renewal of life (Nowen, 1969, p. 19).

To organise reality meaningfully, story shapes perspective. Narratives are communally grounded and personally appropriated—as stories we tell our selves and others about the world.

In addition, faith narratives provide the courage to go on living; they convey Spinoza's idea of *conatus*, i.e., they provide the 'energy' of a self to persist in being what it is. *Conatus* is energy exercised to resist damage accrued in life, to restore our selves when injured and to protect our selves when threatened. As energy, *conatus* encourages people to stand apart from their surroundings, to understand and take charge of their condition (Scruton, 1998, p. 24). Faith is energy that permits individuation, i.e., the initiative to chart new territory in a way of being that typifies one's environment.

An environment is the complex, cumulative effects of social interaction that leave an impression in a dominant ethos or way of being. Environments are specific because they alter over time and are unique to a given place. The tone of an environment has particular relevance to learning how to integrate ourselves appropriately and perceiving our freedom to individuate our selves meaningfully. Integration implies weaving one's self into the fabric of a way of life. Both activities of integration and individuation are essential to faith. They balance one another when faith goes well.

Under favorable conditions, faith is expressed in loyalty to a tradition that is consciously chosen as a way of life—whether secular or religious. As a way of life, faith is fidelity: it is holding fast to one's integrity and keeping one's word, as belief put to use. Faith's exercise implies a kind of attentiveness: we observe ourselves acting congruently with what we claim to believe. Faith as feeling is a way of loving the world. It is an attitude that opposes itself to fear and is forward-looking; mature faith makes peace with uncertainty as it gains a comfortably certain grip on the picture of the world a person holds.

Another dimension of faith is specifically religious. Faith is a comfortable grip on God. Faith holds sure in God, as confident reliance on God's own Self. From Christian perspectives, faith is not superstitious but rests on Christ's 'once-for-all' sacrifice on the cross at Calvary. It is based on a belief that the faithful are related to God *via* historical events of Christ's life, death and resurrection. Faith is grounded on God's initiative from start to finish. Faith continues to have vitality due to the mythological reality of the Living Christ who intercedes for us in heaven (Armstrong, 2005, pp. 106–107). Faith as holding sure in God opens the possibility for enjoying the resources of God's grace: forgiveness and a future. A response to God's generosity expresses itself in worship, integrity and service, enjoys God-infused community, and offers itself to those who suffer the realities of ordinary living. As such, it is a new way of hearing and seeing the world and our selves in it. People see through eyes and hear through ears of faith, or else they perceive experience through a veil of despair.

The primary assumption, then, is that every human being exercises faith. Faith cuts across secular and religious worldviews. If human beings want to be well, they are compelled to make sense of life. Faith fills in gaps in our experience between what we are able to touch, taste, see, hear or smell and realities that we cannot perceive or empirically test. Faith attends to depths that cannot be plumbed with a measuring stick. Faith organises connections between what can be and what cannot be seen. This feature of faith is as true for scientists who study the atom as it is for those who trust an invisible God. Faith refers to a reality beyond mere seeing—a subject on which good science can only pay its humble respects.

In summary, believing is an outcome of faith: it is the action of faith—it is the energy and the narrative that influence daily life. An essential human task is to learn to use faith in the right way, so people can enjoy well-being, whether or not they put their faith in God.

The Spiritual is More Than the Existential

Reflecting on faith is an existential task. It is also educational work since all learning is organising experience. I suggest that spiritual is a larger term than existential since it all addresses human needs the latter does not; it grounds integration, permits individuation, welcomes the possibility of speaking openly about spiritual experience, and acknowledges God concepts along with self concepts in the formation of identity and faith. Spirituality is relational, personal and transcendent.

Despite its vital role in human flourishing, spirituality is silenced in material culture; materialism overwhelms the spiritual. While it is clear that spirituality is opposed to materialism, it is also distinguished from existentialism, even though I assert that faith is an existential necessity. Exercising faith is an existential necessity, but spirituality is more than existentialism.

While existentialism is diverse, it was a universal fad in the 1940s, made popular in Jean-Paul Sartre's insistence that 'man [sic] is condemned to be free' (Miller, 1993, p. 43). Sartre identified in Christian and atheistic forms, a core assumption: existence precedes essence (Sartre, 1968, p. 26). Existence refers to an actuality of being, expressed in choice and responsibility; essence refers to a set of defining characteristics represented, for example, by human nature (p. 26). Existentialism rejects the totalising influence of philosophies that put essence before existence, and in so doing, sum up reality in formal arrangements (Pickstock, 1998, pp. 44 ff.), particular people as members of a genus or instances of universal laws (Concise Routledge Encyclopedia of Philosophy, 2000, p. 265).

For Sartre, absolute truth consisted in 'one's immediate sense of one's self' (Sartre, 1998, p. 44). Like Kant, he formulated his own version of the Golden Rule: 'Everything happens to every man as though the whole human race had its eyes fixed upon what he is doing and regulated his conduct accordingly' (Miller, p. 43). Man is solitary and responsible; he is an unbearable burden to himself and other people, as Sartre demonstrated in his play, *No Exit*, which he concluded by asserting that 'Hell is other people' (Sartre, 1949, p. 47). Transcendence, for Sartre, was possible, but strictly focused: man is the heart and centre of his own transcendence which means that man is self-surpassing (1968, p. 55). To relate his existentialism with my position thus far, Sartre privileged individuation over integration: to be, is to be one's own. Authentic life is solitary. By contrast, spirituality aims to marry individuation and integration, without losing the identity of either.

In emphasising individuation, existentialism failed to take seriously the social power that infuses all human relationships. Michel Foucault countered Sartre's radical assertion of human transcendence and responsibility by revealing the force inherent in 'the order of things'. Foucault revealed social power which exerts an almost irresistible force, compelling individuals to remain in place (to be self-controlled rather than self-surpassing), not simply because of other people, but because the force of one's own subjectivity, ever so subtly, operates eventually to enforce social power over our selves (Foucault, 1979).

If Sartre privileged individuation, Foucault appears to render it as an impossibility – almost. Spirituality, in contrast, boldly aims to link individuation and integration. Its research asserts humanity is deeply connected, arguing that spirituality has a biological root, but acknowledging that human connections are fragile and easily damaged. Due to its biological root, long-term survival relies on acknowledging links that make life bearable for everyone. But spirituality is easily humiliated through ridicule and exclusion. While spirituality claims a strong biological ground in human experience, its expression is informed by its context. It is not simply that materialistic cultures stifle spiritual needs and insight; it is

also due to its own ambiguity that spirituality may be hindered in its free and joyful expression (Hay & Nye, 1998, p. 120), depending on its environment, even though it plays a foundational role in human survival. Alister Hardy (1966), as a committed Darwinist, proposed the hypothesis that religious experience (spirituality) evolved through the process of natural selection because it has survival values to the individual (Hay & Nye, 1998). Spirituality is a form of awareness, transcending everyday awareness which is potentially present in all human beings and which has a positive function in enabling individuals to survive in their natural environment. It is also a feeling of absolute dependence which is not simply an emotion, but is something more like a perception. Spirituality emerges at birth as a dimension of human experience because we are born in bodies and are cared for by other bodies. The spiritual is a bridge between one's own and these other bodies; it is an embodied consciousness expressed through our need for others.

As a biological, psychological necessity, the spiritual is a 'space' that opens up between the personal and the material as infants experience the world and its objects from the time they are born. In the space between inner and outer reality, illusions form and meaning is created. This third site is the genesis of the spiritual aspect of human life; a space that is neither the self nor the world but that is influenced by both. It is a mid-point reality between subjective and objective realities. In this space, objects form (objects or concepts that are the building blocks of mental mythologies) as a child experiences the self and the world; these objects are transitional—they are *go between*s, so to speak, that influence ongoing perceptions of everything. This intermediate space is an area of experiencing, 'to which inner reality and external life both contribute (Winnicott, 1971, p. 2), and which, in turn, acts back on one's perception and understanding of outer and inner reality. It is a stronghold created by the 'perpetual human task of keeping inner and outer reality separate yet interrelated' (p. 2). Embodied, emotionally laden concepts (deep assumptions) may shift their shape with changes in experience or be maintained as fortresses against change as they cohere in the faith narratives we hear and tell.

In this intermediate spiritual space, the organisation of experience happens. Spirituality forms illusions but an illusion is not something false. Illusion is not delusion. All art, science and religion depend on illusion for their existence. Illusion is the bedrock of all learning. Illusions are not false so much as idiosyncratic and useful organising principles for ordinary living. Concepts flourish in the intermediate space between the self and world as 'transitional phenomena', transitional objects of perception. They (image, feeling and idea) are the stuff of thinking; they are experience-rich and assumption-laden. These rich, laden concepts influence perception in terms of one's relation to God, other people, the world and the self, for example, in the value we attribute to other people's lives.

In its integrative role, spirituality forms illusion-based identity through the construction of a mental mythology that acquires a quality of being, holistically conceived, made up of insight, values and beliefs that give meaning, direction and purpose to life, including attitudes, emotions and behavioral dispositions that inform and are informed by lived experience. Its cognitive aspect constitutes a framework

of ideals, beliefs and values about the self, others and the world as a whole that informs but does not determine action. People choose to act according to spiritual values. Spirituality is a dimension of identity formation that helps us sense how we are related to more than material realities. Further, human beings experience something in them 'that expresses and carries the continuity of living personhood', a sense of a 'real me' that lies behind the accumulation of events that constitutes each life from beginning to end, an entity that has been called a soul (Polinghorne, 2002, p. 105). This sense of a 'real me' is the source for individuation that marries integration.

In its integrative/individuating role, spirituality compels us to think. Throughout life, we are called upon to test the world and our selves on the basis of mental mythologies formed early: 'the advance of knowledge consists in the steady replacement of our confused and inadequate perceptions with adequate ideas until...all that we think follows from an adequate idea of the essence of God' (Scruton, p. 23). We see through a glass darkly, until we see face to face. Given its challenge to unite individuation with integration, spirituality recognises that the presence of others draws us away from illusion—our inadequate concept of the way things are. Here lies the strength of spiritual experience; here lies its problem: we may privilege our illusions and imagine others inaccurately and fail to let them speak for themselves.

Think for a moment of someone you dislike, someone you are in conflict with at present. What is your thinking about that person like? Maybe you see images of that person humiliated in your presence and you feel satisfied. Suppose you are conscious of a conversation you wish to have with that person. He or she says one thing, you say another, on the conversation goes. In the debate, you score all the points; the other is stupid, evil or whatever you wish. Observe your conversation. While it seems real and is self-gratifying, it is imaginary. You invent yourself and the other: motives, words, admissions and all. These conversations can be addictive: they may replace the joy and struggle of conversing with actual others—including God. The only way to know another is to have a real conversation in which you let others speak for themselves. You need the other to know the other. All else is imagination—with a core of what is real or it would be a delusion rather than an illusion; but it does not tell a whole story of inter-subjective reality.

This example illustrates what we must accomplish in conversation with God if we want our concept to grow up. God must be allowed to speak as Wholly Other—God above our little concepts. But first we must sense the role that imagination plays in forming our thought-life and the way we think about God. Thinking is powerful. Every human being has a concept of God. It is not possible to grow up in the presence of others without developing a concept for God. For educators, it is essential to unravel the concept for God everyone holds in the mind heard. A primary task is to hear these God concepts (not impose our own) and help them grow up. The aim is not to form well-adjusted adults. We are not trying to help people conform to a sinful and sometimes sick world. Faith education is grounded on the spiritual benefits and blessings of believing in God. We want the roots of

faith in the inner life to grow and flourish into healthy relationships with the Church and the world. A mature believer is reconciled with the child within and is both integrated and individuated in the formation of faith. Integration and individuation are accomplished by understanding one's own story about God.

By the time a child is five years old, through 'the busy factory of the child's imagery', which is a matrix of 'facts and fantasies, wishes, hopes, and fears' and through exchanges with parents, the child concocts an image of God (Rizzuto, 1979, p. 7). Over time, images of God may undergo revision, repression, recovery and reconciliation. As adults, we are never finished with ways that God came into being personally when we were children. However, it came into being, and the process of forming an image of God is complex and mysterious, the God a child creates will come back into memory whenever the puzzles of life are staring an adult in the face. We never leave behind the image of God that we acquire in childhood. But, as adults, we may not be able to say what it is. We may not have consciously considered our image of God. The image carries our feelings about God and unites with ideas of God to form the concept we eventually construct.

Children get an image of God through encounters with parents, siblings and significant others. For example, direct encounters between mother and child—eye contact or gaze behavior between them—is a source for the first elaborations of an image of God (Rizzuto, p. 188). The quality and kind of attention an infant gets from her mother influences not only God concepts; it also influences self-concepts. The child needs to be seen as worthy and wonderful. A child gets this information from the mother's looks and touch. The mother's face is like a mirror. The child sees herself in the mirror. If the mirror is wise, the right amount of attention conveys the child's value. Mirroring may go wrong in two ways: too much attention, or too little. If the mirror is unresponsive, the child does not come eventually to look through the mirror to where a real mother dwells. If the mirror exalts the child beyond what is reasonable, mirroring does not reflect a real child. In either case, a child is deprived of an accurate mirroring of self. If mirroring is unsuccessful, God concepts are negatively affected: mirroring produces narcissism (the self is all that matters) or self-negation (the self does not matter at all).

If the child passes through the mirror to encounter the mother (an image that is later safe to critique) the child can organise her obscure notions of God around this image. The spiritual relation, described earlier, is adumbrated through gaze behavior to constitute concepts of God and self in a child's emerging mental mythology. A child needs the other and longs to be found acceptable. If she is found acceptable, she can relax. If the child perceives herself as bad in this process, her problem is a problem of being. What is wrong is not what the child does; but what the child is (Rizzuto, p. 188). If children perceive themselves as bad, in order to please God they have to become an entirely different person. They may feel eternally unacceptable to God.

Like mirroring, psychological reality relies on the transitional space for play and illusion. The illusion we select—science, religion, or something else—reveals our personal history and the transitional space each of us has created between our objects

and our selves. Our illusions provide the space to find 'a resting place' to live in. but God is a unique transitional object (Rizzuto, p. 209). All transitional objects have a life inside and outside the individual as well as a life in the borderlands between the inner and outer life. For example, a teddy bear is a real object in the nursery as well as an object in the inner world of the child. The teddy bear means something specific to a child—it signifies comfort and safety. Children eventually leave teddy on the self as they outgrow their need for it. They move on to other objects that provide security, friends perhaps. Leaving teddy on the shelf is a sign that the child is moving on and growing up.

Unlike a teddy bear, the image of God is permanent. The image of God is not lost nor is God left on the shelf. It is no more possible to lose our image of God than it is to lose our image of father and mother. Instead of losing meaning over time, God gains in meaning. God resurfaces at crucial moments. While it may appear that God is rejected or neglected, and our image may be repressed, God is always potentially available for further acceptance or rejection. The atheist prays as he rushes to the hospital after hearing his wife was in a car accident. A dying woman accepts Jesus as savior and Lord. But Christians do not wait for emergency rooms to re-conceive God. Authentic, thoughtful life examines and builds its concepts intentionally. God concepts must be transformed to carry us to the next level of maturity. While we never lose the image, it is through persistent spiritual work that our concept of God becomes a resting place for our soul's joy. Let us be clear that the image of God within a person is not the God of the Bible. An image is constructed early as a personalised representation for God. Even those who have not read the Bible, have never been to Church, embrace a personal image of God (Hay & Nye, p. 110). There is no such thing as a person without an image of God. God is unique as a transitional object in another sense as well, i.e., in addition to gaining rather than losing meaning over time. God sees the heart: God is the only transitional object that has complete knowledge of the self: one cannot escape the searching eye of God (Rizzuto, p. 10). Educators must ask whether we put stumbling blocks in the way of a developing concept of God. We must concern ourselves with the learner's personal concept of God so that formal ideas presented are free to encourage growth towards faith maturity. The relationship between individual and formal concepts is complex. Hopefully dialogue between them is possible, productive and healthy so that integration and individuation become balanced. A dialogue with God begins at birth and continues to death. The union of images and ideas into a concept of God within the inner life may take one of the four forms. There are those who

- have a God whose existence they do not doubt;
- are wondering whether or not to believe in a God they are not sure exists;
- are amazed, angered, or quietly surprised to see others deeply invested in a God that does not interest them;
- struggle with a demanding, harsh God they would like to get rid of if they were not convinced of his existence and power (Rizzuto, 1979a, p. 91; Rizzuto, 1998b).

We address people with each of these four concepts of God very differently. Our hope is to help them transform personal concepts into vital, scripturally sound God concepts. With effective integration and satisfying individuation, Christian faith is a lasting source of self-respect and soul; nourishment that meets human need from birth to death and enables believers to offer support, love and service from a life *filled to the measure of all the fullness of God*.

In summary, the spiritual excels the existential as a way of expounding human experience because existentialism is steeped in isolation and burdened by a dreadful responsibility we have for ourselves and others. Other people are a wearisome presence. By contrast, Christianity assumes human connection and encourages maturity by integrating and individuating each human life. Christians are not alone. They are not afraid of other people, but fear Satan. (Matt 10:28). They know that 'hell is not other people', hell would be the absence of God – a possibility not easily put in words.

Knowing God, Loving Others: Relational Consciousness¹

If we take as our premise that every person has a concept for God, spirituality is an aspect of ordinary human experience, a point supported by brain researchers who suggest the brain is 'hard wired for religion' (Sandra Wittelson, McMaster University, personal communication). Spirituality is relational, personal and transcendent and is best described as relational consciousness (Hay & Nye, 1998). The term 'relational' is not applied in a narrow sense. It is a deep sense of connection out of which arises aesthetic, scientific and religious experience, personal and traditional responses to mystery and Being, as well as mystical and moral insight. Relational consciousness refers to something more than being alert and mentally attentive. It is remarkable awareness of one's own mental activity. This is an extraordinary point that Children and Worldviews Project researchers as well as Rebecca Nye make about young children's experience. In contrast, Robert Kegan (1982), following Piaget, asserts that thinking about one's thinking is possible at the level of formal operations, usually with children past eleven. More work needs to be done.) Spirituality is an apparently objective insight into subjective responses to something that fosters a new dimension of understanding, meaning, and experience. What is required of education is that we permit and encourage partial, idiosyncratic and troublesome aspects of God concepts to grow up in the light of scripture, tradition and a satisfying but challenging learning environment so that people achieve a balance between integration and individuation, between being themselves and being with others.

¹ I am indebted to Rebecca Nye for her term relational consciousness which captures the notion of spirituality as expressed by major thinkers from William James onward, when they speak about religious experience.

In addition, relational consciousness is raised awareness that transcends ordinary, solitary experience. It is raised, i.e., intense and conscious and raised, i.e., it is far-sighted. Raised awareness is

- intense awareness
- a sense of being objectively aware of one's self as subject
- aware of one's awareness, and of reality
- a feeling of objective presence, a perception of... 'something there'
- more deep and more general than any merely psychological sense of reality
- experience as a direct apprehension of that reality.

Objective awareness of one's self as 'subject' is particularly important in developing an ability to perceive the world in relational terms; it is an ability to turn attention inward, toward one's own thinking, a 'mark of the spiritual' (Tekippe, 2003, p. 15) and to turn attention outward, toward God and other people.

Transcendence is felt by those who have religious affiliations as well as those who have none. From a Christian perspective it is more than surpassing oneself. Christians are sure that people cannot find salvation, spiritual or social, in themselves (Mounier, 1952). Transcendence is a developed capacity to be present and available, communicative and alive in a universe in which God had invested everything. To experience transcendence is to oppose all forms of dehumanisation and to refuse to participate in our own insignificance.

Relational consciousness is raised in the sense that people who speak about spiritual matters lift their vision beyond the myopia of individual concern. Their gaze includes more than their own interests. For the non-religious and religious, relational consciousness is a response to life as a whole, becomes systematic reflective, and calls forth loyalty to inner ideals. Spirituality as relational consciousness is natural, relying on processes accessible to every ordinary child, even developmentally challenged children (Hay & Nye, 1998). Spiritual understanding is consciously aware of the stories we tell about our selves, God and other people. We engage in an iterative relation between these stories and formal, scriptural stories conveyed through tradition and communal experience. Spirituality also assumes a dialogical relation between essence and existence, in which we become aware of our own uniqueness in light of common patterns we share with other people, common patterns that make human communication possible.

In summary, spirituality is not individualistic and solitary. The relational aspect of spirituality bridges objective and subjective experience, creating an intermediate 'space' between personal and material worlds, accessible from birth. From the point of view of Christian education, spirituality provides every human being with the opportunity to know the only true God and to know Jesus Christ – the one sent to show us how to be human friends of God. As such, relational consciousness is the capacity to envision heaven while waiting righteously on earth. Educators are called to nurture this potential in the life of every ordinary person.

FROM ST IGNATIUS TO OBI-WAN KENOBI: AN EVALUATIVE PERSPECTIVE ON SPIRITUALITY FOR SCHOOL EDUCATION

Graham Rossiter

Religious and Moral Education, Australian Catholic University, Sydney

Introduction

Traditionally, the word ‘spirituality’ referred to the spiritual life of Christians—prayer, and spiritual exercises. It was primarily religious both in definition and practice, and it was applied beyond Christianity to religions generally. Gradually, spirituality acquired a cachet beyond its specific ‘religious’ dimension; it has become a catch phrase that sits comfortably as a term that encompasses a certain lifestyle, a personal philosophy or even a way of doing business. A distinction between the spiritual and the religious emerged, and in some cases, a divergence. Religion no longer had a monopoly on the spiritual. This is illustrated in the sample of quotations below:

[Some of the world’s leading psychologists]...have all agreed that the ‘farther reaches’ of the unconscious connect humanity with a wider spiritual environment. This quest for higher states of consciousness has been an enduring theme in...[the] pursuit of spiritual awakening (Fuller, 2001, p. 58).

Using our Spiritual Intelligence (SQ) means stretching the human imagination. It means transforming our consciousness. It means discovering deeper layers of ourselves than we are used to living. It requires us to find some grounding in the self for meaning that transcends the self (Zohar & Marshall, 2000, p. 35).

Sport cannot equal the sacred traditions as a means of cultivating the inner life. But, as this book makes clear, sport does possess its own unique genius for revealing and opening to people the spirit’s ‘gem-like flame’. Although sport is a most secular activity in a highly secularised world, in its ability to provoke wonder, to elicit deep feeling, to grace our lives with glimpses of timeless

beauty and freedom – in these and other ways sport is, though not religion, something religious (Murphy (cover comments) in Cooper, 1998, p. 1).

Thought Field Therapy: The most powerful technique you will ever experience. Learn how to eliminate fear, anxiety, stress, trauma, guilt, anger, phobias, jealousy, procrastination, addictions, lose weight and increase confidence and energy in minutes! (Piccinotti, 2004, p. 40).

Nova is a Perth/Sydney based Australian magazine ‘committed to exploring leading edge ideas, services, practices and products that help foster a more liveable world.’

These excerpts show how spirituality is being used like a new buzz word with reference to education, medicine, business, sports and travel, and by diverse groups from the religious to the New Age. The understandings and definitions of spirituality have been expanding to accommodate these developments. However, the broader and more generic the definition, the more that everything in life seems to become a part of spirituality. This creates problems for those concerned in various ways with an education in spirituality. Of particular interest here is school education, and religious education in particular.

What then are educators to make of all these developments in spirituality? What are the implications for religious education in religious and public schools – especially with regard to the increasing prominence of non-religious spirituality?

While there are no simple solutions to these questions, this chapter proposes one approach that can have constructive educational implications. It suggests that educators need some perspective on the ‘geography’ of contemporary spirituality. They need some framework for interpreting the development and diversification of spirituality and its relationships with religion. They need to ask questions about what sort of spirituality is being offered today. Such questions can in turn inform judgments about the appropriateness or healthiness of different spiritualities on offer. Many of the questions will revolve around the functions of spirituality, and judgments will need to be made in the light of specified values. Examples of some questions are: What is the role of spirituality? How does it relate to religion? Does it substitute for religion? When is spirituality healthy? And when is it promoting psychological immaturity?

The appraisal of spirituality is not just a professional development task for educators. Children and young people need to learn how to explore spiritual offerings through similar challenging questions. It would seem appropriate at this time to promote more discussion in schools about such an important and complex term, which along with the clarifications such a discussion may generate, may stop the term sliding into the realm of clichés and hyperbole, as can be seen with this offering by Christian minister and ‘stealth evangelist’ Rick Warren!

‘I’m not a bureaucrat...I’m a spiritual entrepreneur,’ he maintains. He promises to ‘reduce your stress, focus your energy, simplify your decisions, give meaning to your life and ...prepare you for eternity.’ As the article noted, Warren appeals to the notion of a ‘comforting God who acts like a great therapist in the sky (Baird, 2004, p. 29).

This chapter is intended to help promote efforts to develop a critical, evaluative perspective on spirituality to inform education. This in turn may help foster the development of young people as critical interpreters of the culture, more conscious of the shaping cultural influences on their spiritual development. The chapter sets out to honour the religious heritage to spirituality while addressing the diverse manifestations of spirituality that have arisen from outside organised religion.

Developments in the Meaning of the Word Spirituality: An Evaluative Perspective

Earlier, the word spirituality was used predominantly with a religious connotation. Now it has been appropriated by a wider range of interest groups and a distinction has emerged between the spiritual and the religious, to the extent that some people now describe their spirituality as non-religious or secular. This distinction is also pertinent to the ways in which spirituality is used in discourses that relate in some way to education. This chapter considers different understandings of spirituality in relation to influential cultural and historical factors. From these considerations an evaluative perspective on spirituality is derived for educational purposes, in other words, a scheme for appraising the appropriateness of any particular offering labelled as spirituality.

If you used the word spirituality in 1960, most likely you would be understood as talking about traditional Christian religious practice; also, for example, if you were talking about Catholic spirituality, it would be linked in some way with the spiritual life of religious orders. But now the word has been appropriated by diverse groups as illustrated above. In addition, there is an interest in spirituality in nursing, the social sciences and ecology; it crops up in areas like healing and the media; even in the new physics, there is some interest in a spiritual dimension to cosmology. Part of spirituality's popularity flows naturally from the view that a spiritual dimension is fundamental to human happiness and fulfilment, but it is vague enough in connotation to accommodate a wide range of interests and lifestyles, including those that are religious, non-religious and even anti-religious.

Clarifying the role of school education, and especially religious education, in promoting spirituality in young people necessarily requires a coherent view of what spirituality is as well as an awareness of its ambiguities; a central educational task for students is to explore the questions: 'What is spiritual?' and 'What is religious?'

One might try to define spirituality comprehensively. However, if the definition seeks to accommodate the wide scope of interest, it can include so much of life that everything ends up being part of spirituality, and this is no more helpful to educational planning than a narrow definition.

Another approach begins with the question 'what *sort* of spirituality' do we want to promote in a particular educational context? This is an evaluative process that analyses issues relating to spirituality and takes a value stance on the particular

aspects that are considered to be most important. These aspects of spirituality can then be used as criteria for informing decisions about curriculum content, resources and pedagogy, and about implications for the organisational and community life of the school. The school context, whether it is a religiously sponsored, independent or government school will alter the terms of reference for this process. Nevertheless, these different qualifying conditions can be taken into account when planning an education in spirituality. As we use the term here, an education in spirituality is not a new subject, but a *perspective* that helps with the examination of all of the different ways in which spirituality enters into school education.

In what follows, a limited selection of issues will be considered to generate a set of key evaluative principles with the intention of informing educational theory and practice. This relatively brief account of the 'geography' of spirituality will not try to cover the extensive range of writings on the topic, but it will help make sense of the developments and trends that have contributed to the current complex situation. For some educators, some of the issues addressed are still 'over their horizon' and not yet matters of concern. The argument here is that all educators, especially religious educators, need to pay attention to these issues. The first step, and indeed a prerequisite for any substantial education in spirituality, is that the educators themselves be well enough informed about the issues to make their educational transactions with students productive.

An evaluative approach to studying spirituality is not only important for the professional development of educators, it needs to enter into educational planning of the curriculum, and it needs to be followed through into the pedagogy of classroom practice especially in religious education. For example, in the religious school, it is not enough to give students access to the religious spirituality of their faith tradition. They also need to learn how to look critically and wisely at the cultural conditioning of people's beliefs, values and behaviour. Many of the same issues noted below need to be part of young people's study agenda in spirituality.

There is a need to refer to an example of a religious spirituality. Because of the limitations to space, this is located elsewhere (Crawford & Rossiter, 2005). This will help identify issues relevant to an evaluation of spirituality by contrasting religious with non-religious spiritualities. Many, including youth, are eclectic in drawing on a wide range of sources, both religious and non-religious for their spirituality. Also, attention to questions about non-religious spirituality is important in relation to values in public education, to values education and to a spiritual/moral dimension to education generally.

Distinctions Between the 'Religious' and the 'Spiritual': Issues for What Constitutes Spirituality

Traditionally the words religious and spiritual were synonymous. Hence, spirituality was naturally considered to be religious. However, this is no longer the case; a distinction, and in some instances, a divergence, has developed between the

spiritual and the religious. Consequently, there are spiritualities that are not based in, or dependent on, religion. Any education in spirituality, whether it be in a religious context or not, needs to understand how and why this development occurred; it needs to be able to explore both religious and non-religious spirituality, their differences and their interrelationships, and to take into account the issues that have shaped thinking about current use of the word spirituality. This is also a fundamentally important question for religions, because one of the major problems they face today is their contemporary spiritual relevance, i.e., is religion satisfying people's spiritual needs? In addition, this thinking can help facilitate dialogue about spirituality between religious groups and those who are not religious.

The following is a brief consideration of what affected this distinction between the spiritual and the religious, with consequences for what is understood as spirituality, in particular, showing how the notion of spirituality can be dissociated from religion. Some of the influences will be explored in more detail later. Each of the issues identified is also pertinent to an evaluative perspective on spirituality. The analysis is organised under the following headings:

1. Secularisation and distinctions between religious and spiritual language
2. Privatisation of religion
3. Public rituals and private devotion (external observance and the personal)
4. Contemporary emphasis on experience (implications for personal autonomy and religious authority)
5. Meeting spiritual needs; spirituality as a consumer commodity
6. Scientific rationalism and modern religious studies
7. Postmodern views of religion

Secularisation and Distinctions Between Religious and Spiritual Language

Increasing secularisation in Western societies is evident in the decreased prominence of formal religion in political, social and everyday life. Participation in formal religious practices decreased significantly; religious authority and distinctive religious culture declined as influences on people's thinking and behavior; people were getting by with less formal and conscious attention to their religion.

Secularisation implied that religions did not have a monopoly on spirituality, and this supported the notion of non-religious spirituality. The spiritual/moral domain was not restricted to religion. Indeed, for some people, their spiritual/moral concerns had little if any link with formal religion. For others, religion permeated their spiritual concerns. While there were others who retained an affiliation with religion, their spirituality included elements from beyond their own faith tradition, including both religious and non-religious components. In public discourse, shared religious beliefs and shared religious language could no longer be presumed. Other spiritual language had to be used for the discussion of spiritual, moral and religious issues in pluralist communities where a variety of religions and non-religious world views were represented. Words like beliefs, values and commitments were used more frequently, acknowledging the presence of different religions and religious

spiritualities in the same way that the use of inclusive language was developed to acknowledge gender differences that non-inclusive language tended to ignore. This situation called for the development of a language of spirituality that was not dependent on Christianity or any other religion, while it should be able to accommodate religion comfortably. This supported a distinction between 'religious' and 'spiritual' but not an exclusive distinction.

Privatisation of Religion

A consequence of secularisation was the tendency to regard religious beliefs as a private and personal matter that did not need to be acknowledged in public. In turn, this could make people think that religious beliefs were a matter of 'opinion'; and one person's opinion was 'as good as another's'. It was easy to associate the word spiritual (and spirituality) with this private domain, and to use religious to describe the public, formal world of religion. In addition, the words 'organised religion' were used to differentiate formal religion from the private or personal religion of the individual.

For some, the gradual disappearance of formal religious practice and religious imagery from their everyday lives made them wonder whether they were religious anymore; or wonder in what sense were they religious. Spirituality was a good word for this situation: people retained religious beliefs about God, the afterlife, prayer and a moral code, and they acknowledged a likely influence of religion in the values they absorbed from their family life. For some, spirituality referred to their ultimate beliefs about the purpose of life, while it had little relevance to their everyday living. For others, their notion of spirituality was very much concerned with daily life as it included values, commitments, intuitions, wisdom, attitudes and creativity.

Public Rituals and Private Devotion (External Observance and the Personal)

Following in the wake of the above mentioned developments, there was a tendency to associate 'religious' with formal, communal rituals in the faith community, while 'spiritual' was associated with the realm of personal, private devotion. The distinction was used most by those who wanted to distance themselves from religious rituals. Unfortunately, the usage can easily create a false dichotomy, as if formal communal religious activity would be empty of personal devotion, an idea that has been foreign to the religious faith traditions.

Contemporary Emphasis on Experience (Implications for Personal Autonomy and Religious Authority)

Confluent with the above, developments has been an increasing reliance on people's own experience as their touchstone for truth, authenticity and lifestyle. This changes attitudes to religious authority and to religious traditions. People imbued with a strong sense of individualism can tend to measure the relevance of religious

authority and religious traditions in terms of how they enhance or inhibit their own personal lifestyle and sense of autonomy. They can feel that they have direct personal access to spirituality and God, without being dependent on formal religion and religious leaders. In turn, this affects the way they could associate 'spiritual' with the former and 'religious' with the latter.

Existential concerns have become so prominent that they can limit historical perspective and interest in future developments. This existential emphasis affects the notion of the spiritual. It has to have here-and-now relevance; it must be linked to current feelings of well-being.

Meeting Spiritual Needs: Spirituality as a Consumer Commodity

There is nothing wrong with expecting spirituality to meet contemporary spiritual needs. However, caution is needed because it is only a short step from here to a consumerist approach to spirituality. Consumerist spirituality needs scrutiny. If spirituality is regarded as just another aspect of human nature that needs 'development' and 'satisfaction', then spirituality can readily become commodified and marketed. Commercial gain can be part of the driving force in providing opportunities for spiritual development. The same can apply to religion, as evident in some of the religious programs that air on Sunday morning television.

Caution is recommended with respect to consumerist spirituality for much the same reason that caution is important for consumerist views of education (medicine, law etc.): they have the potential to lose sight of the sanctity of the human person and deal with people as object consumers for commercial gain. It is unlikely that we will ever be without some forms of commercial spirituality and religion. However, an education in spirituality may help alert people to potential problems.

Scientific Rationalism and Modern Religious Studies

Somewhat different from the above distinctions between the religious and the spiritual have been the effects of scientific rationalism and modern religious studies. These are not necessarily linked but each has affected the cultural and intellectual climate in Western countries as far as perceptions of religion are concerned.

Scientific rationalism over the last two centuries (influenced by the Enlightenment) has tended to undermine simple views of religious truth as well as to bring traditional religious authorities into question. If science and reason have provided such a successful explanatory account of human life and culture, this can give the impression that religion has been superseded. However, while this interpretation may be dismissive of religion, if it still recognises a spiritual/moral domain, then it will further the distinction between the religious and the spiritual and will support a non-religious spirituality.

Perhaps more than any contemporary religious studies, Biblical scholarship has had a profound influence in enhancing Christian theology, and in turn, in enhancing Christian spirituality. Nevertheless, from outside Christian circles,

systematic studies of religions can give some the impression that religions are generic (variations on a common theme), and that the idea of absolute religious truth is a myth that religions foster. This furthers the distinction between the religious and the spiritual; it sees religions as different 'avenues' to the spiritual.

Postmodern Views of Religion

Cultural postmodernity questions the validity of metanarratives, while acknowledging their socially constructed, contextual meanings and cultural functions. This highlighting of uncertainty in personal knowledge creates doubts about religious truth claims. Somewhat inevitably, this thinking steers a course in favour of 'spiritual' rather than 'religious'. The hyper-questioning stance of extreme postmodernism can incline people to dismiss tradition and history, while at the same time discourage hope for the future. This approach readily reinforces a 'here-and-nowism'—a relatively complete existentialist and pragmatic focus. Such a focus limits the breadth of human purposes and often goes hand in hand with present consumerism as the meaning and purpose to life as if 'I consume, therefore I am' (Bridger, 2001, p. 10).

While for many people the spiritual and the religious are so closely related as to be indistinguishable, the questions considered above show that distinctions and polarities have emerged between the two with consequent implications for the understanding of spirituality. They also raise issues for the evaluation of spirituality estimating the quality of what is offered as spirituality against specified criteria.

Non-religious Spiritualities

For those who were consciously non-religious, the language of spirituality provided a suitable alternative to religion. In some instances, the alternative to religion was sought on the grounds that religion was failing to provide an appropriate and meaningful spirituality. As already noted, a confluence of pressures from the advent of science, rationalism (from the Enlightenment) and secularisation affected the cogency, plausibility and perceived relevance of religions; they had been the traditional sources of meaning. A recent example of the substitution of a relatively non-religious spirituality is evident in the book *SQ: Spiritual intelligence, the ultimate intelligence* (Zohar & Marshall, 2000). They concluded that: 'The rapid of changes in the Western world over the past three centuries have left conventional religions struggling to be meaningful'. Hence, people need to use their own innate spiritual capacities 'to forge new paths to find some fresh expression of meaning, something that touches us and that can guide us from within' (Zohar & Marshall, 2000, p. 8).

This emphasis on personal experience, autonomy and relevance or meaningfulness was contrasted with 'conventional religion' which was stereotyped as '...an externally imposed set of rules and voice. It is top-down, inherited from priests and prophets and holy books or absorbed through the family and tradition' (Zohar & Marshall, 2000, p. 9). The suggestion that religion is only needed by those who are

'spiritually immature' is commonly associated with this view. Levin (2000), also writing about spiritual intelligence, considered that this new spirituality enabled people to 'cut out the middle man', bypassing organised religion and 'gurus':

In the old external order there is a hierarchy. 'God', or some ultimate authority figure, sits at the top, followed by his 'Church', the priest, the institution, men, women, children, animals – in that order. To relate to 'God' you must go through a priest, and a church. But that is no longer the case. We are all being urged to connect to spirit directly...Instead of relating through the old triangle, the old hierarchy, we are being asked to connect directly with God, or the force of spirituality, or the force of the creative – however you see it, the words often confuse the issue. It means that, as well as dramatic changes in your relation to spirituality, the role of the priest or the guru is also changing. Altogether. They are no longer your link to spirituality or God (Levin, 2000, pp. 38–39).

This argument has appeal for those interested in spirituality, but who want little or nothing to do with organised religion. It does propose something of a 'straw man' image of religious spirituality; there are many practitioners of a religious spirituality who would claim much personal autonomy and direct access to God. For example, there are many Christians who draw strongly on their denomination's religious traditions for their spirituality, while being relatively autonomous in relation to Church authority. They will make up their own minds when it comes to disputed questions. Nevertheless, there are a significant number of people, including many youth, who feel that religion is mainly irrelevant to their spiritual quest, and this understanding motivates their search for a non-religious spirituality.

A major type of non-religious spiritualities are formal groups that consciously espouse a spiritual nature for humans and propose practices to enhance spiritual well-being. Fuller (2001) in his book, *Spiritual but not religious*, gave an account of a wide range of such groups. Some examples of metaphysical philosophies from the nineteenth century were: the Universalisers, Free Masonry, Swedenborgianism, Transcendentalism, Shakerism, Mesmerism, Spiritualism, Mind Cure, and Theosophy. There is an even greater range in the twentieth century.

Other non-religious spiritual groups focus on astrology and the occult; or they constitute some form of New Age spirituality. In addition, there are groups that draw to various extents on Eastern religious and Eastern non-religious thought and practice.

Then there is a considerable number of psychological/spiritual movements and practices that have been used in association with both religious and non-religious spiritualities. These range from traditional Rogerian Encounter Groups, to the popular Myers Briggs personality inventory, the Enneagram and rebirthing etc. Useful psychological insights and wisdom are readily incorporated into spirituality. The word spirituality has also been appropriated by what has been called the 'self-help' personal development industry. This is a diverse group including various therapies, holistic movements, meditation, yoga, etc., catering for people's

interest in furthering their own psychological development and well-being. They often promote spirituality as a central aspect of human development.

In Western societies there is now a large smorgasbord of spiritualities ranging from particular religious spiritualities to many different non-religious spiritualities. In addition, people may be eclectic in borrowing from different spiritual sources and practices without changing their basic spiritual orientation. For example, Christians will incorporate spiritual insights from various psychological movements and they may borrow from Eastern religions and spiritualities.

From the perspective of an education in spirituality (in different contexts) the evaluative purpose outlined earlier becomes important. Such an education would seek to inform about the origins and history of spiritualities, about the social developments that have affected spirituality, as well as consider criteria for evaluating spiritualities.

The following sections will work further towards a set of evaluative criteria by considering some issues for spirituality, and including more detailed comment on some questions noted earlier.

Consumer Spirituality

Spirituality should help meet personal needs. But if this is its exclusive focus, three developments become more likely. Firstly, individuals lose a sense of community and traditional meanings; secondly, commitments to others, and to particular communities are weakened or abandoned; and thirdly, spirituality tends to become yet another commodity for a consumerist lifestyle. It can be marketed and exploited for its 'feel-good' potential. The noble aim to seek spirituality as part of personal development can be affected by a consumerist ethic.

This is evident where religion and religious spirituality become 'business oriented'. For example, the contemporary Christian minister Rick Warren referred to at the start of this chapter calls himself a 'Stealth Evangelist'. He sees himself capitalising on a 'new great Awakening spiritually in America'. The newspaper article on Warren said that he 'encouraged ministers to think of their churches as *businesses* and congregations as *customers*.' It concluded that he was appealing to a notion of 'a comforting God who acts like a great therapist in the sky'—thus compromising religious concerns for social issues and social justice (Baird, 2004, p. 29). The author considered that 'while the desire for personal change is admirable, an obsession with self-fulfilment distracts from the need to change the world'. She quoted favourably a more desirable alternative view from another pastor:

Is it enough to preach sermons that centre on individual struggles and offer guidance along the path to a more meaningful and fulfilling personal life? I can't help thinking this is a time when we should be challenging our people to move beyond the personal to the public—indeed, the political—and commit

themselves to transforming the world ...Jesus, our role model, not only cared for hurting individuals but also shattered the cultural conventions of his day and turned his society upside down (Baird, 2004, p. 29).

The uncertainty and existentialism of postmodernity naturally incline people towards consumerism: 'if life is fraught with ontological uncertainty, why not find meaning in consuming as much as possible while we can?' (Bridger, 2001, p. 10). If this happens, spirituality can lose its transcendent perspective and its capacity to critically interpret the culture. In religious terminology, the prophetic quality of spirituality is diminished as it becomes a relatively indistinguishable part of the prevailing consumerist lifestyle. In considering this aspect of spirituality, one writer claimed that:

postmodern consumerism is ...a worldview reaching into every aspect of Western culture, shaping our lives from cradle to grave. It constitutes *the* dominant metanarrative ... 'Consumerism is ubiquitous and ephemeral. It is arguably *the* religion of the late twentieth century (Bridger, 2001, p. 10).

Traditionally, religion provided a systematic *world view* in which the Divine provided overall meaning and purpose to life. With postmodern cultural trends, the importance of world view recedes into the background. Instead, what becomes important for individuals is *life world* and its components. The need to find some overarching meaning system for life can be supplanted by a concern to maximise the consumer products that enhance life style and immediate sense of well-being.

Attention needs to be drawn to a number of aspects of consumerist and commercial spirituality that are important for the critical evaluation of contemporary spirituality:

- Consumerist lifestyle emphasis: In relation to the popular contemporary quest for spiritual fulfilment, it is evident that a 'plethora of spiritualities, each with its own claim to provide a final answer to existential angst, reflects exactly the pattern and dynamic of consumerism' (Bridger, 2001, p. 11). This pattern is evident in some who search for meaning and satisfaction in religion, or in esoteric religious practice, alternative spiritualities, new age and even in alcohol or drugs.
- Existential gratification: There is an emphasis on the gratification of personal needs and interests here and now. How people *feel* about spirituality will be more influential than their thinking—feelings about comfort and well-being will sway choices about the spiritual. On this point Bridger considered that: 'The 'instant satisfaction' culture of the shopping mall is so deeply embedded in the Western psyche that, insofar as the search after spirituality represents the consumerist ethic, it is to be expected that those engaged in the search will conform to this ethic' (Bridger, 2001, p. 12).
- Consumer notion of freedom: Personal freedom tends to be interpreted in terms of individual consumer choice from a variety of options.

- Private and personal: Spirituality tends to be regarded as more of a private and personal matter than something that is rooted in community and historical tradition. Spirituality can then be like 'personal opinion' and 'one opinion is as good as another', and is 'entitled to equal respect'.
- Individualistic frame of reference: The emphasis is on the individual constructing his/her own version of spirituality. 'Spirituality becomes a matter of subjective experience whose efficacy is judged by the extent to which it meets the subject's self-perceived needs and desires. And since these are in a constant state of flux, consistent only in being driven by the impulse to gratification, the spiritual search consists of a neverending stream of sensation-gathering as the individual moves from one attempt at fulfilment to the next' (Bridger, 2001, p. 12). The individual's own experience becomes the touchstone for authentic spirituality.

If spirituality embraces values and commitments that are not just self-centred, then at times it will conflict with personal feelings and individual interests. Fidelity to commitments will not always be emotionally comfortable; life motivated by a healthy spirituality will not always take the easiest 'feel-good' path. Commitment to other people and to long term life goals can be aspects of spirituality that 'transcend' self-centredness, and thus transcend consumerism. This echoes a particular interpretation of Christian religious spirituality that it is precisely in a level of self-forgetfulness that goes with concern for others, that individuals may find their 'true' selves.

A Style Spectrum of Spiritualities: From Organisational/Structural Religious to DIY (Do It Yourself) On-the-Run Psychological

In the diverse developments within both religious and non-religious spiritualities, it is possible to discern a prominent polarity formed from the confluence of the cultural influences and issues noted above. Towards one end of the spectrum is what can be described as *organisational/structural religious spirituality*. This is where a religious spirituality is strongly located within a local faith community. It is defined and expressed through worship, liturgy and religious practices as well as through authoritative religious teachings. The faith is articulated in a systematic theology or world view, including a moral code. A comprehensive beliefs package is accepted, even if individuals do not understand some aspects, and even if some beliefs are puzzling. Religious identification is tied up with firm, and often relatively unquestioning acceptance of the orthodox teachings. Religious identity is regarded as important; it is defined over and against other religious and non-religious groups. What the individuals believe and their religious practices, in addition to nurturing their spirituality, also have a 'boundary construction' role, serving as boundary markers for the religious group, keeping them separate and distinctive. There is an emphasis on absolute truth and certainty in religious claims. Often there is a strong focus on preparation for eternity, on salvation and atonement for sins.

This sort of spirituality gives a strong sense of personal and spiritual security. It sees religious beliefs and practices as defining one's integrity and they also help in 'coaxing' God to intervene and make their lives more successful (not only spiritually). It braces itself against cultural postmodernity (and any other influences) that may be perceived as dangerous because of their eroding effects on faith. This style of spirituality can be found in all traditional as well as relatively new religions, in both older and younger members. Also, it is evident in some non-religious spiritual groups.

Towards the other end of an extensive spectrum is what can be called *DIY On-the-run psychological spirituality*. This spirituality is more personally constructed according to need and less dependent on a religious institution with a comprehensive beliefs package. There is more personal freedom, but this puts more onus on the individual for constructing and living out a spirituality. It is somewhat 'tailor made' to help negotiate life on-the-run, dealing with spiritual questions as they arise with interpretations and constructions that are felt to be the best available wisdom. It may well draw substantially on the individual's own traditional religious heritage (e.g., Scripture and Theology), but it will be a well-developed and usually complex interpretation. It is focused on present life (a psychological emphasis) and not much concerned with a hereafter, although this is not dismissed, especially when death looms closer with old age. It adverts to the spiritual and moral dimensions of ongoing life experience. It may seek transcendent and religious experience as well.

Some individuals have moved towards this style of spirituality in varying degrees because they were not functioning comfortably within the organisational/structural framework described above. Others may find themselves towards this end of the spectrum by default, by being too busy, or through lack of much conscious attention to spirituality. Some may be in this position being consciously spiritual but not religious. Others have this style of spirituality while remaining identified with their traditional religion, but their mode of participation in the church or religion is markedly different from the organisational/structural style. Some of the characteristics of a DIY On-the-run spirituality are given below. They resonate with what was said earlier in the chapter about trends and issues in spirituality.

Becoming more personally autonomous and responsible for one's spirituality may result in wanting to select aspects that have a desired function or meet particular needs, hence the standard world-view set of teachings and organisational religious practice will not be satisfying; or the individual will not take much notice of the beliefs that they feel are marginal. Multiple comparisons of religions and non-religious views of life can incline individuals to de-absolutise religious truth claims, seeing them as more symbolic than historical/factual, pointing in a valuable spiritual direction, but not *all* of the truth. They can be eclectic in sourcing spirituality beyond their own religious tradition. They experience secularisation but do not see it as a spiritual problem, and being busy, they may not have the time for a lot of religious practice if it does not seem to meet any real need.

The psychological emphasis implies that this spirituality seeks to be relevant to people's lives and moral decision making. It emphasises individuality but this is not necessarily anti-communitarian. Nevertheless, communities of this type, whether

they be religious or non-religious groups, have a different style of social and spiritual functioning from one of the organisational/structural type. However, it is common for local religious faith communities to be far from homogeneous, having a great range of spiritualities represented from across the complete spectrum. Hence it is usual in communities of faith, perhaps even normal, for there to be give and take, and even some conflict arising from different spiritualities and different needs. Sometimes faith communities can work together and rise above such differences in spiritualities but sometimes they cannot. Much depends on the leadership, key personalities, distribution of power etc. It is not uncommon to find these same differences in spiritualities within a family group.

Some with a DIY style of spirituality remain very active and involved in their faith community; for others, it is their style of spirituality that draws them away from organised religion. This DIY on-the-run spirituality can get by comfortably with a measure of acknowledged natural uncertainty about the big spiritual issues of life, God, death and afterlife. It does not need to rely on the traditional package of beliefs, selecting wisdom from a variety of sources that makes sense of their experience and can guide their moral life. They are more aware of the 'real uncertainties' both in life and religion than the 'unreal certainties' they sometimes perceive in the organisational/structural style of religious spirituality. For the DIY style of spirituality, there is less need for religious identity boundaries.

This spectrum ranging from structural/organisational to DIY on-the-run is important for interpreting the diversity of spiritualities in youth. It also signals the to-be-expected problems with an education in spirituality that is sponsored by the official religion or church. Official formal religious education, especially in religious schools, tends to have a curriculum that naturally leans towards the organisational/structural because it is institutionally sponsored. Hence there are difficulties to be negotiated for both teachers and students whose spiritual orientation is towards the other end of the spectrum.

Healthy Spirituality: Criteria for the Identification and Evaluation of Spirituality

Judging what is a healthy and desirable spirituality always takes place within a specific context where there are presumed values and beliefs whether these are religious or not. Here a starting list of evaluative criteria is proposed that can be further developed. The schema can be used pedagogically for identifying, analysing and judging the strengths/weaknesses of what is being offered as spirituality. The list is generic and could be applied to religious and non-religious spiritualities. It needs to be contextualised with the articulated beliefs/values of the particular group engaged in evaluation. It will also be useful for individuals in the personal appraisal of their own spirituality.

Criteria such as these (with amendments and additions) can be used in teaching/learning where the topic spirituality is being explored in the classroom. Also, engaging students in the task of considering what might constitute a 'healthy'

Table 1. Evaluative criteria for the identification and appraisal of spirituality

Initial list of evaluative criteria for the identification and evaluation of spirituality	Evaluative questions and issues
Transcendence	<p>The particular understanding of transcendence: Is it a human transcendence or does it include a notion of god or higher power? Is this higher power personal or a non-personal creative life force? In what ways does the spirituality relate to religion?</p>
Frame of reference: the individual, as well as something larger than the individual	<p>The frame of reference for spirituality needs to respect the uniqueness of the individual; however, if the frame of reference is no larger than the immediate personal needs and interests of the individual, there is a danger of self-centredness and narcissism. To what extent does the frame of reference for this spirituality take into account community at both local and wider levels? (human/social environment). What historical traditions in spirituality give perspective to contemporary concerns, and a balanced interpretation of existential needs? Is there a custodial concern for the physical and animal environments?</p>
Personal reflection	<p>Cultivation of a habit of reflection on life experience and contemporary issues. Includes critical interpretation of culture. Development of a constructive, resilient personal meaning for life.</p>
Confidence in human knowing	<p>A healthy spirituality needs to come to terms with uncertainties about meaning and value that go with postmodernist dimensions to contemporary Western society. This includes confidence in personal knowing, while recognising the natural limitations to socially constructed knowledge. Personal knowing may be imperfect and in need of ongoing evaluation; however, it can provide an authentic basis for human meaning and can inform constructive decision making and commitments.</p>
Inputs that inform and challenge spiritual understandings.	<p>A healthy spirituality is presumed not to be static. It includes openness to activities (reading, education, new experience etc.) that prompt reflection and continued development of spirituality. Openness to learning from other spiritualities.</p>

Continued

Table 1. *Continued*

Initial list of evaluative criteria for the identification and evaluation of spirituality	Evaluative questions and issues
	This view of spirituality presumes that it is not enough to claim to be spiritual in a nominal way – there needs to be some activity that challenges and enhances spirituality, or that shows spirituality in ‘action’.
Spiritually motivated values and commitments.	Spirituality that informs and inspires values and commitments, and a sense of social justice. Spirituality, values and commitments affect personal action and action on behalf of others.

spirituality has considerable educational potential. This list of evaluative criteria implies a value position about what constitutes spiritual health. In turn, this is based on a particular view of the human person. Three of the principal concerns in this list are as follows:

Firstly, there is no doubt that a healthy spirituality should enhance the personal and social life of individuals. However, if the personal needs and interests of the individual are the exclusive frame of reference for spirituality, this can more easily move into self-centredness and narcissism. A balance is needed so that the personal meaning of the individual embraces something larger than the self. This is needed for both religious and non-religious spiritualities. Fundamental to this view is the belief that individuals are born human but they become persons through social interaction. In other words, being both a contributing and a receiving member of human community is central to human nature. When applied to spirituality, this means that authentic spirituality has to be community related; you cannot be fully spiritual on your own. This thinking proposes that the frame of reference for spirituality needs to include family, local community and the wider human community. In addition, it considers that responsible stewardship for the environment should also be part of the value base of spirituality.

Secondly, these criteria propose that a healthy spirituality should not be static and not just ‘implied’ in the way people live their lives. It needs to be sustained and developed by reflection, education (in the broadest sense) and habits of spiritual activity. For example, it is considered not enough to claim that ‘I have beliefs and values’, ‘I believe in God’ or ‘Spirituality is implied in my lifestyle’. An authentic spirituality is proposed as one that motivates behaviour and leads to personal/social action. Healthy spirituality continually challenges the individual to practice, extend and deepen spiritual insights. Healthy spirituality is cultivated.

Thirdly a healthy spirituality needs confidence in the personal knowing process. The postmodern strand in contemporary Western culture calls absolutes and

metanarratives into question, and its emphasis on the uncertainties and ambiguities in socially constructed human knowledge have led to excessive subjectivism, contextualism, existentialism and relativism. While it may be unrealistic to claim knowledge of absolute truth, it is both realistic and pragmatic to believe that one can know part of the truth with confidence, and act on this with integrity. Given that the uncertainties in knowing (especially in the personal domain) are natural to the human condition, and if this is accepted, it is both possible and reasonable to claim that one can construct a spirituality that is authentically human with respect to self and others. This spirituality will not be perfect; it will advert to spiritual traditions, but it will not be constrained by them; it will make mistakes; it should be open to revision and enhancement. But it can help people chart a meaningful and hopeful life in uncertain times, times that seem to have unprecedented opportunities for human life and wealth, while at the same time having pressures, gross inequities and threatening uncertainties that affect basic human meanings and quality of life. Such a spirituality can turn the contemporary emphasis on being critical to advantage by engaging in the critical interpretation of culture to discern the influences on people's thinking and behaviour, and to evaluate their significance. For example, it needs to critically evaluate postmodern thought.

Other views of spiritual health, not unlike what has been proposed here, have been discussed in the literature. Fisher (2000, 2001) noted the emergence of the term in writings about health. He considered that it was a pervasive dimension to overall health and well-being, and that it involved harmonious relationships in four domains – the personal, communal, environmental and transcendent. This is consistent with writings about spirituality that understand it as self-awareness coupled with relationships with others and the environment, a 'relational consciousness' spirituality (Hay & Nye, 1998). Others have considered the importance of spirituality for overall personal health (Goodloe & Arreola, 1992; Hjelm & Johnson, 1996), and its contribution to personal 'resilience' (Witham, 2001; Pargament, 1997). These are inner resources that help people cope with life, particularly when there are difficulties to be overcome.

No doubt there will be debate about the evaluative criteria proposed here. The list needs to be debated, modified, and informed by the beliefs and values of particular groups seeking to educate the young in spirituality. The very process of debating these criteria and the beliefs and values that underpin them is a particularly valuable part of an education in spirituality for both adults and school students. Pedagogically, a scheme like this is useful when teaching spirituality because teachers and students are drawn into considering what sort of spirituality is being explored. This chapter, and the issues and evaluative criteria it has explored, can help in this process.

SPIRITUALITY AS A BRIDGE TO RELIGION AND FAITH

Dr David Tacey

School of Critical Enquiry, La Trobe University, Melbourne

‘There exists some point at which I can meet God in a real and experimental contact with his infinite actuality’ (Thomas Merton, 1961, p. 37).

Religion in a Disbelieving World

Currently many people perceive religion as irrelevant, especially in the Western style democracies. Religion must not capitulate to this criticism, but nor can it afford to dismiss it lightly. For the fact remains that religious ideas and symbols seem remote and alien to an increasing number of people, especially to young people (O’Murchu, 1997).

This is not their ‘fault’ and religious tradition cannot attack them for this failing. It is simply a failing of our secular and materialist culture. This process of disenchantment has taken place gradually over hundreds of years, since the rise of the empirical sciences (Berger, 1999). It may take hundreds more to restore the religious to its true importance, so we are in this for the long haul. Ironically, it may be the new sciences that restore the dignity of religion, just as the old sciences took it away (Ward, 1997). The new sciences will take us closer to the heart of reality than we have so far achieved, since we have been studying the surfaces of life with a primarily mechanical logic (Pearce, 2002).

The problem is that our intellectual enlightenment has been reductive and incomplete. We have seen through the superstitious and mythological trappings of religion and exposed these as ‘illusory’ or false. But our ongoing intellectual enlightenment has to take us further, beyond the superstitious surface of religion to its living spiritual core (Trias, 1998). Then we might arrive at a vastly different vision of the world. There is a deeper dimension of religion which is beyond superstition and cannot be destroyed by rationalistic enquiry.

By definition the secular does not understand the religious, and is resistant to it. Modern society is profoundly secular, and even children in religious schools are primarily identified with the secular order. They want to feel part of the mainstream, and are not keen to identify as 'religious' if it means appearing eccentric or out of step with social reality as they see it.

Secularism often claims that religion is 'indoctrination', but secular materialism is one of the greatest indoctrinations of all (Carroll, 1998). It has virtually made 'reality' itself appear flat and secular. It has excluded mystery, eternity, and depth from the real. In a great feat of mental engineering, secularism has made its view of reality appear as 'common sense', and it has made religion seem aberrant or unreal. Many in the educated West go along with this worldview, not realising that they have been coerced by a materialist ideology.

Religion Needs to Dialogue With the Inner Life

Fundamentalists of various persuasions believe that the task of religion is to fight back, to match might with might, to wage a campaign to combat the rising tide of secularism. The logic of this position is seductive, but it undermines the whole point of religion which is to lift us into an experience of God, not to lower us into the terror of aggression, violence, or counter-indoctrination. Fundamentalism is a regressive cultural force, in my opinion, and my sincere hope is that it does not capture the passion of the religious spirit of our time.

The religious challenge, as I see it, is not to oppose science or secularism, by advocating creationism or 'intelligent design' as an alternative to natural science. This is an impoverished route that indicates an appalling lack of creativity and imagination. The real task ahead is for religion to join with the sciences in creating a new vision of reality (Griffiths, 1989). Religion must stop being anti-modern or pre-modern, and become thoroughly post-modern, a progressive force in society which gathers the best of the sciences and leads us to a new attitude of awe, reverence, and wonder. At the core of the secular world is a deep emptiness and hollowness, and recent scholars have argued that religion can speak to this emptiness and lead it to a new awareness of the necessity of the sacred (Caputo, 2001).

Charismatic and Pentecostal renewal is one way out of our contemporary plight. However, it often strikes me as cultic activity or passionate entertainment rather than a pathway into faith or spirituality (Schultz, 2005). Religion has to expand its imaginative resources, and offer other ways to reach people, beyond fundamentalist re-packagings, reactionary moralism, or cultic revivalism.

Clearly, the old forms of religious education involving 'instruction' in the faith, preaching, or intellectual propositions, are no longer enough. It is coldly external and does not generate enough human feeling or transformation. It no longer captures or revitalises the human imagination. But there is another way of working with religion in dark or destitute times. We have to dig deeper and involve the subjectivity of individuals. Religion needs to establish an *existential*

purchase on the soul, and once it does this it will blossom and regenerate (Rahner, 1975; Johnston, 1995).

Beyond the hard, abrasive or showy methods of revivalism, there is a softer way of working which involves dialoguing with what is going on beneath the surface of people's lives. This is the way of spiritual dialogue, and its chief elements are conversation, prophetic imagination, and psychological insight (Tacey, 2004). Spiritual dialogue involves receptivity to where people are at, and a drawing forth of the spiritual content that is already present in their lives. This strategy is particularly suited to young adults who do not like to be told what to believe by outside authorities but who welcome any sincere attempt to illuminate the semi-dark realm of their interiority (Tacey, 2001).

Religion needs to have more faith in the capacities of the human soul. Too often, there is the anxious thought that religion has to be 'added' to life from outside (Rahner, 1975). This leads to the familiar patterns of evangelising and good works, but there is not enough emphasis on the internal processes of the soul. There is an inside story which is important to grasp, and religion needs to become more psychologically sophisticated if it is to move confidently into the future (Jung, 1933).

The art of spiritual dialogue is the art of drawing out the religious life that is already there, but that has often been repressed or ignored. My work begins with the premise: 'Called or not called, God is always present.' This motto was carved above the front doorway of Carl Jung's house in Zürich, and remains there today. God is eternally present, but we are not always aware of this presence. In secular times, God is mostly not *called* by us, but that does not mean that we are not called by God. As Thomas Merton (1961) has said: 'It is not we who choose to awaken ourselves, but God who chooses to awaken us' (p. 10). Those who believe that religion has to be constantly applied and supported from without are missing the point of God's eternal presence, and are inflating the importance of religious institutions. The demise of our institutions in our time may have nothing to do with the demise of the perceived reality of God.

Spiritual Life Beneath the Surface

Although people's minds may be swayed by secularism, their hearts or souls are not convinced. At a deeper level, people are waiting to be drawn into a new and different story. Secularism is a kind of mask, hiding a secret, underneath life that only rarely breaks through to the surface. One of my students wrote:

Underneath their hardened secular shells, people still need to believe that there is more to their existence than just one fragile life, that, in the sweep of time, is over in a blink of the eye. The majority of people still have faith, or rapidly try to recover faith in the critical and urgent moments of our lives. This is today's reality, which is confounding to me: why do we wait for adverse circumstances to occur before we reach out to touch the face of God and to be embraced by the holy? (Carolyn, 2002).

Another student wrote: 'Currently, most people are seeking something beyond their profane existence' (Michael, 2002).

These are challenging statements, and I believe religion has to learn more about the psychodynamics of secular experience. Many people are only atheists on the surface, while underneath the soul longs for the healing embrace of God.

Many of us are split between reason and faith. With our heads we cannot support religion which seems unbelievable. With our hearts we are open to spiritual meaning. We reject belief in dogma, but we might still be capable of faith in God. In the past, faith was something that was passed on from one generation to another, handed down the line with love and reverence. But this no longer works because science and education have stopped the mind from accepting the gift of faith without question.

Today, faith is often acquired, if at all, through spirituality, that is, through an internal recognition of the importance of faith to the soul. The external 'passing on' of faith has been blocked, but the internal route has hardly been explored. If religion wants to survive, it has to make the ground of our experience a primary site for investigation. Our emphasis on tradition, which we often confuse with habit or convention, can blind us to the religious possibilities of our immediate experience.

Secular society alienates people from traditional religious forms, but it cannot entirely alienate people from their souls. The soul's longing for meaning, for contact with the sacred, remains intact, despite the secular assault on religious forms. This is why a phenomenon called 'spirituality' begins to rise up in the midst of secular society. This phenomenon is a shock to secularism and religion alike. This element of our experience cannot be held down but will keep coming back. Derrida said that the letters 're' at the start of 're-ligion' ensures that this activity will re-turn, re-vive, and re-new. 'Religion', he writes, is 'what succeeds in returning' (Derrida and Vattimo, 1998, p. 39).

But when the spirit rises again in secular conditions, it is not going to appear conventionally religious. It will not know itself as religious, because it is emerging from experience, not from tradition. The spirit falls out of theology and becomes existential. It falls out of theology and into psychology.

This is why countless young people today say they are 'spiritual but not religious'. They associate religion with what is outside, in the institutions, and do not understand that their internal lives are deeply religious. The word 'religion' has shrunk to mean something like church attendance. Spirituality *is* religion on the inside, but many youth do not understand this. But nor does formal religion recognise its essential kinship with spirituality. Hence there is a stand off, a two-way block, and a kind of phoney war. It is imperative to put an end to this war through understanding and dialogue (Schneiders, 1986).

Religion of the Future: Mystical, Experiential, Existential

The new spirituality longs for mysticism, not devotional worship; that is why traditional religion often fails to recognise it as religious. We have narrowed the term 'religious' to a series of conventional practices, but the new spirituality is not

churchy. Mysticism longs for an experience of God, not for God-talk. People do not want *talk* about God but a life-changing *encounter* with the sacred. The times have changed, but the churches have not changed with them. They still imagine that people will come to faith by the old routes, but this seems increasingly unlikely. People will only come to faith today through experience.

Religious tradition often objects to this: 'experience' of God is too great an expectation or ideal. 'This is simply not possible,' they reply, 'and today's people are being greedy, they are asking too much of God.' 'Who do modern people think they are?' 'Why do they think themselves worthy of what used to be reserved for saints and monastics?' 'What they are asking for can only be bestowed by the grace of God.'

Perhaps so, but this is the depth and extent of our hunger. We are destitute and, our hunger has made us desperate for the sacred. We can no longer be content with hearing about God second-hand, through sermons or scripture, through tradition or rumour. The postmodern person says: if God is real, I want to know this reality in my own life; I want to experience this reality.

Perhaps the term 'religious experience' sounds too grand and exalted for what people want. They do not expect the heavens to open to them; they do not expect to witness a miracle, or an angel descending. No, they ask for something more ordinary but no less life-changing: an intuition, an inner feeling of security, a deep, gut-based recognition that God exists and that they are beloved of God.

It is of course ironic that secularism has given rise to such an intense hunger for God. Secularism sets the conditions for its own demise by depriving people of what they need to survive (Berger, 1999). But as I have said, the new spirituality is not easily satisfied by the old religious forms. The churches cannot easily minister to the new hunger, which looks greedy, intense, individualistic, psychological and heretical beside what the church has dispensed in the past. New wineskins are needed for the new wine.

If religion wants to play a part in this new development, it will have to rediscover its own mystical heritage and resources. It will have to dig deep into the area of spiritual exercises, meditation, mystical prayer and chanting, all of which are designed to draw out the latent spiritual feeling in people's lives. The religious model needs to change: we need to draw more freely on the God within, on the sacred sources within the self, on the interiority of the soul. If Christianity cannot reinvent itself as a resource for spirituality, my prediction is that Buddhism will take over. Youth cultures seem already headed to the East.

The Courage to Face Our Emptiness

Beneath our secular mask, there is a great emptiness, a God-shaped hole. The best option for the religious educator is to move toward this absence, to speak to it, to give voice to it. But this has to be done tactfully, with boots off, tip-toeing in difficult and sensitive terrain. Many of us expend a great deal of energy pretending

things are 'okay', that things are terrific and getting better, and so to expose our inner emptiness can meet with enormous resistance.

The secular society pours enormous resources into our inner void, telling us that we will feel better if we consume more products, eat more food, drink more wine, or travel more often. The recognition that we are hollow inside is guarded with utter vigilance and enormous defensiveness. If we allowed ourselves to feel that hollowness, even for a minute, our secular mask would crumble. So there is naturally great resistance to the voice of religion whose job is to proclaim the existence of something more.

But in the postmodern world, there is an opportunity, an opening, a chink in the armour. It is not so easy any more to pretend that things are wonderful. As times get more desperate, old defences and devices no longer work. A student wrote this:

Attitudes to spirituality have changed in recent times, and have become more receptive. I don't think that it is seen as a weakness any more to admit to the feeling that there is something missing in our lives. In the modern era, to refer to the spirit, and to call attention to what was missing, might have raised the ire of those of us who felt we were getting along nicely without 'spirituality'. Today in the postmodern world it is more obvious that we are missing something, and to point this out is no longer seen as offensive or impolite (Amber, 2003).

I have found that as soon as the absence is acknowledged and faced, something new emerges. Nature abhors a vacuum, and it is the same with the soul, which is our inner piece of nature.

Spiritual Education: Working Behind Religious Lines

We are in an experimental phase, and the experiment must go on. In my work I have chosen to listen intently to what the students are saying and to try to accommodate it. I attempt to tune in to what the spirit is saying through the students and to adjust to that. The times calls us to be prophetic as prophecy is the only way to recover spirit when the spirit has gone underground and is no longer obvious to the upper world.

My job is not to be a religious educator, but I see myself as a spiritual educator. I seek to locate the spirit in students' lives, and to lead this spirit out to what it wants to become, to where it wants to go. I work in a secular institution which is opposed to religious instruction, so I have to be sensitive to the secular conditions of the university and not offend the values or standards of my employers.

Moreover, my students are diverse and multi-cultural: they come from all walks of life, all cultures and nations of the world. Some are atheists, a few are traditional believers of Judaism, Christianity, and Islam, while others are followers of Hinduism and Buddhism. But the overwhelming majority of students are secular or 'lapsed religious' people. They have fallen out of their natal faiths or religious traditions because they have not been able to believe without any foundation to belief. They

are among the millions in society who are on personal journeys of meaning. The student population is diverse, plural, fragmented, and at times chaotic.

Therefore, it suits my workplace requirements, and my student population, to work behind religious lines, as it were. If asked directly, I will own up to being a Christian of mystical persuasion, but in my course on spirituality I almost never use religious terms or concepts, but try to speak to the spirit of the time in the terms that it most enjoys: that is, mystical, experiential, existential. Because I have a background in the depth psychology of Jung, I am able to use his psychological terminology instead of a theological one. This works well as I am able to speak about the things of the soul and the spirit without offending most people.

In order to lead the spirit forward, I ask students to draw from their own experience and to supply their preferred terminology. At the start of the course I invite them to write autobiographical essays about their lives and their longings. I urge students to reflect on their experience, to read poetry, mysticism, and inspirational works. I also ask them to reflect on their experiences in nature, as that appears to be a major site for contemporary reflection. I ask them to use their imagination and to activate their intuition. The results are surprising and sometimes astonishing.

The Intuitive Art of Spirituality

Students have a passion for spirituality. They appear to be at home in it, whereas previous generations were not. It is as if a taboo has lifted in society, and the constraints of secularism are no longer effective. They are less embarrassed to disclose their inner lives, and they seem more prepared to challenge the values and attitudes of science or society, if these stand in the way of a spiritual life:

We cannot see spirituality, therefore it is hard to believe that it exists. Those who work in the field of science believe what they see, so they have no belief in spirituality, whereas those who think with their hearts and have an open mind are open to believing in spirituality (Gorica, 2003).

I doubt whether I could have written like this as an undergraduate. I would have been too embarrassed, and I would not have had enough confidence to invest so much value in the inner life. Developing a relationship with an invisible presence is what students today cultivate in their writings, reflections, and conversations. I think they are spiritually more mature than youth were in my generation. The key to this could be the postmodern condition which allows us to experience more than the surface reality (Caputo, 2001).

The resources of feeling cannot be underestimated. The spiritual life is discerned and kept alive by powerful feelings, and people who are in touch with their feelings are less likely to shut down the spiritual life because it seems absurd to the mind. Feeling says yes, go on the journey, but the intellect worries that the area could be illusory. Here I find a noticeable difference between male and female students.

Women seem more prepared to accept the reality of the invisible world, whereas men are inclined to argue the point, to doubt and prevaricate. This is not true for all men, and it is certainly the case that 'masculinity' itself is changing and becoming more sensitive and receptive (Tacey, 1997).

In matters of spirituality, thinking is not enough, and it will not get us there. There is something more fundamental than thinking which we might call the intelligence of the heart, and our educational system is not good at drawing this out. Feeling and intuition are hugely important and very effective when they work together with thinking. Feeling discerns something more behind our empty centre. Some students report a deep longing that cannot be satiated by love affairs or normal life:

Spirituality to me is a particular kind of longing. This longing is almost an intense physical feeling that haunts me, and makes me ache for something. It is quite elusive, as what I long for is not immediate; I cannot see or touch it. It is a longing for something that is a long way off, and often leads me to melancholy. I recognise that what I long for is impossible to grasp, but the intensity of the feeling is strong. I cannot provide an easy solution to this longing, and recognise that the search will be long and hard. I am hoping that this course will help me understand more clearly what I am longing for (Leah, 2003).

These are deep and profound feelings, and we see here the incredible expectations that some students have about the course.

The spiritual journey calls forth something, and students seem to recognise that this calling forth requires a faith that there is something 'there' to connect to. The reaching out is an act of transformation because in our attempt to reach out the object of our longing is stirred to activity:

Spirituality is like a flower that blooms when it is seen and acknowledged. The more you are able to nourish it, the stronger will your spirituality become. It does not matter how we actually conceptualise spirituality, what matters is that we acknowledge that it exists, and with that acknowledgement comes the support and strength of an inner life (Gorica, 2003).

Postmodern students often sound like mystics of the ancient past. They write, like Meister Eckhart or St John of the Cross, of the importance of imagination in the cultivation of an inner life. We need to 'imagine' another life into existence. This activity is to be distinguished from mere fantasy. The role of imagination is not to invent new worlds and escape into them, but to draw forth something that is already there. This is not a flight from the real but a deepening into the real.

This inward imagining is called intuition by many students, and intuition is a faculty that is vital to the work of soul-making:

Spirituality is a kind of inner knowing. You believe in something that you haven't seen before, but somehow you know it exists (Gorica, 2003).

By its nature, the divine is inexpressible and beyond definition, therefore our spirituality is always an approximation only. Spiritual knowledge is essentially intuitive, an awareness of another reality that often begins to manifest in our lived experience and deep introspection. This knowledge is often due to disillusionment with a purely profane kind of existence. Spirituality is the awakening of innate knowledge, a return to the sacred, and a desire to realise our true potential. It is the search for the hidden self, for our true nature (Joanne, 2003).

Sometimes in my classes, I am not sure who is the student and who is the teacher. I learn so much from what students say, and frequently feel humbled by the level of insight into these sensitive areas.

Teaching in Order to Draw Out What is Already There

If I say I ‘teach’ spirituality, this is not exactly true. I act as a facilitator, not a teacher in the conventional sense. Our ideas of teaching are narrow and often lacking in imagination. We teachers are too concerned with dispensing knowledge and information, and this takes place in an active, not a receptive mode. We need to allow things to unfold, and allow for being and not just doing.

The idea for setting up a course on spirituality came from the students, not from my colleagues or me. For many years, students told me about their spirituality and said that the courses they were studying did not enable it to come forward. Even when I first set up the spirituality course, I was too much in the active mode, dispensing information, and being the caring and providing teacher. But teachers need to be re-educated in the task of caring for the soul and not just the intellect. There is a great amount of spirituality in students’ lives that never gets a chance to express itself, and is not allowed into the curriculum. We teachers need not only to give knowledge but also to receive wisdom, both from our own hearts and from the hearts of our students. There is a kind of unwillingness to engage wisdom, perhaps a deliberate attempt to avoid it, whether through embarrassment or through lack of training in this area.

Certainly, part of our problem is that we work from defective or incomplete models of education. We carry an old prejudice that students are empty vessels and they do not have innate wisdom. I think much education begins with the faulty premise that we are vessels that need to be filled, to be directed, corrected, shaped, and conditioned, all from outside. We forget that the people we are addressing are not just young people in need of information, but souls and spirits who need to *remember* who they are and what they already know.

It this innate, Platonic dimension of education that interests me more as time passes. To facilitate the soul’s remembering, the teacher has to play lightly with his or her authority, and take risks with it, because to some extent the authority of the teacher stands in the way of the intuitive process. Intuition literally means, tuition from within, not from outside. We are good teachers when we dispense accurate

and useful knowledge, but we are even better teachers when we allow a process of tuition to arise from within. The word *education* comes from the Latin 'educare', and means 'to draw out', 'to lead forth'. Spiritual education is about drawing out what is already there.

Finding Tradition in the Soul

The frustrated religious educator who is tired of teaching religion to unreceptive students needs to find a new way of teaching. If young people are turning off, if they are not receptive to religious instruction, we owe it to the spirit and to God to find a new path. This new way is paradoxically the oldest of ways: the Platonic and Socratic path of education, which is based on the metaphysical premise that the soul is already ancient and wise, even though it appears before us in the form of a young student. My motto as a spiritual educator is 'less is more'. The less I emphasise external tradition, the more the students appear to 'remember' the values and attitudes of traditions spurned or forgotten. Some students have never been exposed to any religious tradition in their lives, while a great many have been brought up in a natal faith that has been rejected as they matured into thinking and questioning adults.

In the course of spiritual education, something new and wonderful often occurs to students in relation to their forgotten or rejected traditions. They begin to re-value and re-possess what they have rejected. I will provide a couple of examples. First, from a young man:

It is hard to sway a convinced materialist like myself from his constant scepticism about religious matters, at least I thought it was before this course. But it is terribly hard to continue to oppose the idea of 'spirit' when it is presented in poetry and inspirational writings. Before the course, I blocked out religion as irrelevant to my life, it made no sense to me at all in its conventional, archaic and drab form. But when spirituality is expressed in poetry, passion, and subjectivity, I have to take another look, as these expressions are inspirational and move me in an unexpected way. I now see that emotion and spirit can be included in my world, and I can have such elements without straying from reality (Steven, 2001).

Steven says he is 'hard to sway', but he has been 'moved in an unexpected way'. When an inner connection is made to spirit, the person is able to change his or her views on religion and the outside tradition. People sometimes refer to themselves as hardened materialists or 'atheists', but these tags only refer to their minds, not to their hearts. The heart is always looking for more, and waiting for something 'unexpected' to take place.

I often notice that young men are very concerned about the problem of reality and how best to adjust to it. Steven says, with a good deal of relief, that he is pleased he can have spirit 'without straying from reality'. This is the point I was

making earlier: secularism has conditioned the idea of reality, defining it in its own terms, and excluding spirit from the real. People dare not affirm spirit in case they are becoming unreal to themselves and disloyal to their concept of reality. To affirm spirit is to rebel against the secular model, and men won't do this unless they have some 'scientific' evidence at their disposal. They want to 'meet God in a real and experimental contact with his infinite actuality' (Merton, 1961, p. 37). Received belief is not enough for them. But when spirit is felt as an internal reality, then outside tradition can be given a new meaning. They are able to believe if their hearts have been prepared for the new reality.

What I am suggesting is not new but has been argued by many religious thinkers. The need to ground belief in experience has been indicated by numerous theologians and philosophers, including Tillich and Bultmann on the Protestant side, and Rahner and Lonergan on the Catholic side. Bernard Lonergan wrote: 'The fruit of the truth must grow and mature on the tree of the subject, before it can be plucked and placed in the absolute realm' (1968, p. 3).

This contains the seed of religious renewal. In the past, religion expected us to admire the fruit of truth in the absolute realm, but it must first be grown on the tree of the subject.

My second example comes from a young woman. She had made the typical distinction between personal spirituality and organised religion. She did not share Steven's materialism or disbelief, for she could sense, like so many women, the presence of spirit in her own life. But she could not find much purpose or 'living reality' in the religious traditions. By the end of the course, she admits that she can now see religion in different terms:

Before I started this subject, I was confident in 'bagging' Christianity for the way in which it had failed me. Empty rituals, outmoded morality, and corrupt institutions, etc. Yet as the weeks have passed, I have come to realise that a more sophisticated dialogue is at my disposal. I have discovered that my childish repudiation of the Christian Church revealed a lack of knowledge into the nature, depth and multi-layered appearance of spirituality within religion. I come away with greater respect for my religion of origin, and for the presence of spirituality in what I had thought was a dead and moribund institution (Jenny, 2002).

I must emphasise that I have not taught formal 'religion' at all in this course. Any reflection about the status of religion is coming entirely from the students. I do not promote or criticise religion, but only attend to the personal or subjective experience of the spirit. For many students, religion is first seen as irrelevant, and most students write in the first weeks of the course that religion is an obstacle to their spirituality. By the end of the course, they begin to shift their perspective: religion gets a second viewing, no longer an obstacle, it can become a resource for spirituality.

What delights me about my course is that I am seeing similar processes operating in different faith traditions. For instance, a Jewish student, Malke, said

she had been in Jewish schools in Melbourne as a child, and in adolescence she went to live in Israel where she attended specialist institutions. But the spirituality course with me had been more powerful, she said, in linking her with her native Judaism. Although my course was not about Judaism, or any other religion, she said it had done most of all to connect her with her religious heritage. I found this astonishing, and she wrote two autobiographical essays on this theme.

Islamic students have said the same thing: 'My Islamic teachers taught me about religion, but not about spirituality,' wrote Fatima (2003), an Australian student born in Turkey. 'In this course, I have seen how Allah speaks to me from within, and he is not confined to the outside religion or even to the Koran.' Whether this is heretical or not within the Islamic tradition, I don't know. It certainly would not appear heretical to Sufism, the mystical tradition of Islam.

The spirituality course creates a 'climate of validity' in which various faith positions can be re-experienced and re-affirmed. This process, if sensitively handled, can operate in a truly multi-faith and multi-racial context. If I had come across to the students as more overtly religious, using fully articulated Christian language, for instance, then much less spiritual development would take place, and I would have offended or insulted the majority of my students. The Islamic students would have walked out, and the Jews, whether practising or not, would have followed them. The lapsed Christians, the secular, and the atheists would have protested, and we would have been embroiled in political wrangling and intellectual warfare. By refusing to preach, by looking for a 'generic' language of the human spirit, peace and harmony reigns in the multi-cultural classroom, and yet each individual is entirely free to affirm whatever faith position is pleasing to their soul.

I have to accept that traditionalists from the world's monotheisms do not like the approach I am advocating. They find it too soft, too open, and too ill-defined. I have been formally denounced by religious conservatives for promoting these attitudes, and referred to in condemnatory letters as a 'polytheist'. This has hurt me, but the experiment in spiritual education must go on. I am personally not interested in asserting, along with my forefathers, that one tradition – Christianity – is better or greater than the others. Even less am I interested in arguing whether Protestant, Catholic, or Orthodox is the 'right' version of the Christian story. I am not essentially interested in promoting creed, dogma or denomination. I am too much of a postmodern intellectual to believe in the idea of Absolute Truth, but I do believe in truth with a small 't'. Truth is the spiritual recognition that sets you free.

Concluding Remarks

Today postmodern society is adopting a kind of scientific approach to religious matters. People are saying they would like to believe, but they cannot believe until they have some experimental foundation upon which to base their belief. They

need empirical evidence drawn from their own experience. They go on spiritual journeys, exploring their inner lives and trying to match the inner world to what they discover in the outer world. What is being pursued is a spiritual empiricism, a fascinating mix of science and religion.

One of my students wrote: 'Spirituality is the truth you discover, whereas religion is the truth that is handed to you by tradition' (Kate, 2004). It is apparent that the truth you discover is preferred to the truth passed on by tradition, but these are by no means contradictory. In fact, they are complementary because if religion contains truth, spirituality, working with different methods and ideas, is bound to end up affirming the same or similar truth. It is simply that truth is arrived at differently, in a way that suits the taste and requirements of the postmodern world.

The challenge to religion is to take up a meaningful dialogue with the new spirituality that is felt in today's society. As Karl Rahner wrote, tradition in the past tried to pump religion into people, but the new art is to draw religion out from people (1975). That is a great challenge for a tradition that has understood its role in external or functional ways. It must now recognise that it has to work from the inside out.

DEFINING SPIRITUALITY IN EDUCATION: A POST-SOVIET PERSPECTIVE

Inga Belousa

Faculty of Education and Management, Daugavpils University, Latvia

Introduction

This article describes the background and context of religious challenges in the contemporary post-Soviet era, provides the theoretical framework of teachers' understanding of spirituality as a dimension of education in Latvia, and integrates it within the perspective of international theories and models of religious and holistic education. It argues that spirituality is an essential concern of teachers' profession and that while spirituality cannot be taught, it can be actualised in education as a learner's inner way towards her/his own truth. This article also proposes that teachers' wisdom regarding spirituality can contribute to reimagining and reconstructing teacher education in Latvia as well as in other post-Soviet countries.

Religious Challenges in Contemporary Post-Soviet Era: Background and Context

The former Soviet Union countries present an unique picture for religious education in the 21st century. They share a common socio-cultural situation that lasted from the end of World War II in 1945 to the early 1990s during which any activity connected with religion was forbidden. In 1991 when the Soviet Union collapsed opportunities arose to acknowledge religion publicly and to attend to religious education. This awaking coincides with the observation of Australian educator Tacey (2004) who describes a contemporary society which is 'realising that it has been running on empty, and has to restore itself at a deep, primal source, a source which is beyond humanity and yet paradoxically at the very core of our experience' (p. 1). In former Soviet countries this source has been temporally buried. Nevertheless it was powerful enough to emerge after 50 years

of Soviet occupation. Although purposefully subjected to elimination, it did not perish, and instead helped people to survive the conditions of war, occupation, and genocide.

Joining European Union in May 2004 three former Soviet Union countries – Latvia, Lithuania, Estonia – are witnessing growing processes of globalization and inclusiveness, increased technological development, and serious reevaluation of human potential. These are some of the trends which challenge traditional concepts and descriptions of religion and spirituality and which confront religious educators with unfamiliar reality that goes beyond individualism, dogmatism, indoctrination, and hierarchical structuring of reality, and fosters the development of whole field of religious education. Currently concern for religious education in Latvia, Lithuania, and Estonia occurs within the context of increased interest in the role of spirituality in society, and its connection with public education.

This article draws on the study (Belousa, 2005) conducted to explore teachers' understanding of spirituality as a dimension of education in Latvia. It focuses on the understanding of religious education that recognises religion as an integral part of public education. Even while religion was forbidden and people were prevented from experiencing religion, a religious spirit remained in teachers' dreams, desires, and was nurtured in various of ways. Teachers have a profound understanding of spirituality, and they tend to implement spirituality in their teaching activity. Accordingly, spirituality is a fundamental dimension of education in its wider meaning that should be considered by teacher educators as a bench-mark of educational activities for teachers-practitioners and teachers-to-be.

Teachers' Understanding of Spirituality

Teachers' deep and profound understanding of spirituality was recognised in the teaching activities connected with the course, 'Spirituality of Pedagogy,' which is a required course in the master's level programs of Daugavpils University entitled *Environmental Education in Pre-school and Primary School, History of Pedagogics, and School Management*. The main objective of this course as described in the syllabus is to acknowledge the connection between spirituality and education: to explore its nature, role, and diversity, to elicit its personal understanding, and to design practical implications for its implementation in educational institutions. The course provides teachers with a forum to reflect on and deepen their experience of teaching. The teachers' deep involvement in discussions of spirituality and education suggests that this issue is significant for them (Belousa, 2000; 2002; 2003). There is often anger about the lack of importance this issue had in educational philosophy and practice during Soviet times. Also, there is a sense of relief and openness to the current possibility of addressing the spiritual dimension of education.

Since 'spirituality is grounded not in doctrine or dogma, but in the place where all debates are resolved, where everyone and everything is equal, the place from which all life came' (Palmer, 1998b, p. x), the experience of teachers was used as the

primary source of information. To generate a theoretical framework of spirituality as a dimension of education the grounded theory methodology (Glasser, 1978; Glasser & Strauss, 1967; Strauss & Corbin, 1990) was employed.

It was discovered that spirituality as a dimension of education is viewed by teachers as an inner way towards the truth that integrates three typical characteristics of the nature of spirituality within education – *an essential element of human reality*, *the inborn drive to learn*, and *an inclination to rise above*. Accordingly, spirituality in education is a constant process of a person's inner development and growth, of rediscovery of spirituality as a core of human nature, following the inborn drive to learn, and rising above everyday reality. The rise above one's limits of education and socialization leads to reconsidering assumptions about the core of one's own being. A person immerses oneself in the heart's education by choosing the path of self-knowledge and self-realisation, communal experience, and holistically participates in education in order to be faithful to the inborn drive to learn. These paths suggest that spirituality in education is not realised through application of certain strategies. Rather, the paths cited lead to rising above what is learned and gaining new or reconstructed understanding and experience. In so doing, the process provides one with the possibility of being aware of one's own reality, of transcending the self, and reaching the fullness of one's potential. Therefore, spirituality in education can never be completed because every moment of a human life has the potential for new learning experiences. This process of journeying towards the truth occurs within a particular context, which depends on particular conditions and on the quality of personal involvement.

The spiritual dimension of education refers to one's inner way towards the truth that embodies (a) the acceptance of spirituality as an essential element of human nature; (b) the following of one's inborn drive to learn; and (c) the experience of rising above one's inner resources. Spirituality in education is a dynamic, continuous, and interrelated process through which a person yearns to reach the fullness of one's human condition. The dynamics of spirituality nurture a developmental life journey that is an inner way to truth. Thus, spirituality is deeply embedded in the human condition, while likewise transforming and transcending it.

Spirituality: An Essential Concern of Teacher's Profession

As highlighted earlier, spirituality is an essential concern of the teacher's profession which goes beyond imparting knowledge and skills. Rather, teaching is about creating a learning environment that opens up possibilities for students to acknowledge the spiritual dimension of their lives. All the educational content is considered to be the possible means which reveal the spiritual dimension of reality. Learning, then, is a process in which students are involved in discovering themselves in relation to others, to their surrounding environment, and to the ultimate. Therefore, spirituality is an inherent issue of education.

Access to the spiritual dimension is the core of the teachers' profession. All teachers have the ability to be aware of the spiritual dimension of education. By choosing to be a teacher, teachers follow the call to nurture the inner lives of their students. Some teachers are directly aware of the nature of this call and others intuitively follow it. Spirituality as a professional concern suggests that the profession of teaching is a vocation and not a routine job, as asserted by Durka (1995; 2002), Harris (1987; 1988), Kessler (2000), Miller (1994; 2000), O'Reilley (1998), Palmer (1983; 1998a) to mention but a few.

Spirituality is an inner potential that can be acknowledged, trusted, and nourished alongside the ongoing development of professional teaching competencies. Teachers must be true to themselves and exhibit congruency in their words and deeds so that there is a balance between their inner and outer world. They need to trust in themselves and in what they are doing in order to understand their students and to foster their inner development. Listening, openness, curiosity, and being fully present to the other are some other qualities that characterise the inner wisdom of teachers' in the educational process. Teachers must rise above a mundane view of reality and see the bigger picture. When spirituality is neglected or denied as a component of the educational process, teachers can experience frustration, inner imbalance, and dissatisfaction with their own professional activity. However, a positive attitude towards their profession promotes success, and should be celebrated, as emphasised by Durka (2002) and Harris (1987; 1988; 1995; 1996).

All teachers have the potential to implement spirituality in the educational process. It can be done regardless of the subjects taught, age groups, personality, interests, or abilities of their students, and it can be learned by anyone who teaches, as suggested by hooks (1994). Spirituality in education can be fostered by organising student-centred learning and providing integrative opportunities for their holistic involvement in the educational process. Teachers' attempts can be successful when they realise that their role is to promote and facilitate the learning process of students through promoting different ways of knowing and acknowledging students as active discoverers and creators of knowledge. Teachers' educational activity should extend beyond the limits of school as the only or the main educational establishment to interconnect family, school, and society. Such a common goal and interrelated educational activities will nourish the spirituality of learners.

Spirituality, when recognised in education, inspires and empowers teachers. It is the primary energy of teachers' vocation, as asserted by Palmer (1998a), a premise for being passionate about teaching (Nash, 2001; 2002), and, as argued by Conti (2002), the root of insight that transforms education into a sacramental and sacred act. Thus, spirituality is a vital key to teachers' professional success.

Discussion about spirituality as an essential concern of teacher's profession contributes to the vast number of studies which consider the impact of teachers' professional behavior, thinking, values, beliefs, and lived experiences on their professional concerns, processes, and outcomes. It confirms the significance of an unified and holistic understanding of a teacher's personality and the influence of one's inner concerns on professional activity.

Spirituality in Education

The interconnectedness of spirituality and education in terms of spiritual intelligence (Sinetar, 2000; Zohar & Marshall, 2000) and literacy (Wright, 2000), spiritual curriculum (Llewellyn, 1998; Miller, 2000), spiritual teaching (Kessler, 2000), nurture and awakening (Moffett, 1994; Nakagawa, 2000) through education from early childhood (Coles, 1990; Hart, 2003; Hay & Nye, 1998) to adult education (English, 2000; English et al., 2003; Tisdell, 2003; Vella, 2000; Zinn, 1997) is widely discussed in the field of education from a philosophical point of view. Works on spirituality in education are more recent. What it means to be human from a postmodernist viewpoint (Griffin, 1988; 1990; King, 1998; 2001) is a key aspect of spirituality as an educational dimension. Spirituality in education requires a new paradigm of thinking or a new style of consciousness, as claimed by Tacey (2004). The notion of spirituality as the human quest for meaning and truth denotes is a cross-curricular issue in the educational process which provides an impetus for teachers to reorient *from* activities that attach spirituality to values, morality, ethics, or affectivity *to* activities which acknowledge spirituality as a universal human reality that embraces ultimate elements and ensures a subjective relationship with the things that are encountered. Such acknowledgement of spirituality as a dimension of education provides an unique perspective of education consistent with ideas radically different from the traditional one. It is described in recent educational writings as the call for reimagining and reconstructing of education. For example, Tacey (2004) claims that to fosters spirituality in education it is necessary to evaluate the current understanding and process of education in general. Thus, not only are new methods, strategies, or course books needed but a new paradigm of thinking and teaching as well to ensure that spirituality is approachable for both religious believers and unbelievers (Wright, 2000). So, spirituality is neither a theme or a study course in the school curriculum nor a final outcome that can be learned. Therefore it cannot be added to education as one of its parts, as cautioned by Silkalns (2001). This understanding of spirituality implies an evolving process that acknowledges the human quest for meaning, self-actualisation, and application of ultimate values to daily life. Spirituality in education is a dimension that should be recognised as the core of the educational process.

Inner Way Towards the Truth

Spirituality in education as the *Inner Way* is a metaphor for a journey that implies a process of growth and development of one's inner world. It is a process of following one's inborn drive to learn and the inclination to rise beyond that which is habitual. There is a certain dynamic between these steps which suggests a continuous interplay between them. When spirituality is acknowledged as the core of human reality, the inborn drive to learn serves to expand one's inner horizon. And when a critical amount of learning is reached, the structure of the inner horizon is transformed according to new and advanced patterns. The transformed inner reality then calls for repeated acknowledgement of the spiritual core of human reality that

is based on the newly shaped horizon. Thus, the inner way is truly an everlasting circling or spiraling that implies several returns to the visited positions but always in a new and broader quality.

The *Truth* in the notion of education as a spiritual journey is also a metaphor. It incorporates existential questions about one's life. These questions help to distinguish the notion of the fundamental meaning and purpose of life. When these questions are approached, learners are able to recognise that the spiritual dimension is an essential aspect of human reality. The truth also provides a possibility to discern that spirituality implies ultimate qualities and their embodiment within particular conditions. This means that the ultimate core of spirituality is both common or constant, and 'translated' or dependent on the particular socio-cultural situation (Tisdell, 2003). To probe the ultimate core of spirituality requires stepping back from one's own reality, looking at the habitual conditions from aside, contrasting them with other different embodiments of the truth, and exploring the things that are common. As discussed in Wright's (2000) model of critical spiritual education such an activity requires critical skills of 'reading' spirituality as the content of human reality and its contextual expressions. Clearly, then, spirituality should be recognised as a dimension of education.

The Nature of a Person's Inner Way

The nature of a person's inner way is constant and processive. It implies moving forward towards discovering and re-discovering the truth according to the newly attained patterns of knowing. Its notion of growth, change, and development suggests the embeddedness of spirituality in the field of education. It can be pictured as journeying deeper and as discovering new and previously unrecognised layers of the truth about self, others, the surrounding world, and the ultimate.

This quest for the inner dimension of life is inborn and natural, as seen reflected in young children. Yet, the traditional approach to education is rather oblivious to the quest for one's inner core. It overshadows the inner quest and submerges it. What is needed is an holistic approach that recognises spirituality as a universal human reality which is affected by the particular socio-cultural situation which can either foster its process or distort it. Education which fosters students' spiritual literacy is crucial.

The process of discovery and re-discovery of the truth has existential, transformative, and transcendental manifestations. The *existential manifestation* of a person's inner journey is based on the quest for the core of one's existence, as Miller (1993a; 1993b; 1994; 2000) suggests, a need to bring soul and the sacred into education; or, as Moffett (1994) claims, the necessity to spiritualise education. It has the potential to open up the ultimate dimension, to connect each person with the ultimate source and with animate and inanimate nature. This is consistent with the observation of Tacey (2004) that spiritual education should be existential rather than creedal, and of Wright (2000) that this type of education has to move 'beyond a mundane level to grapple with issues surrounding the fundamental meaning and

purpose of life' (p. 12). So, too, O'Reilley (1998) invites her readers 'to frame the central questions of our discipline as spiritual questions, and to deal with them in the light of our spiritual understanding' (p. 2). This quest introduces a sacramental perspective where everybody and everything is pictured in the light of its meaning and relationship with others. It reveals that the ultimate is an incarnate reality, ever present in the mundane. It helps one to perceive the nature of a human person as multidimensional and holistic.

Spiritual teaching and learning enables transformation. The *transformative manifestation* of the inner journey implies recognition and response to one's inborn drive to learn which can potentially expand the inner horizon and nurtures different skills and abilities of a person. This is consistent with Tacey's (2004) observation that spiritual education is transformative, and with Palmer's (1983) assertion that spiritually attuned teaching has transformative power. It also supports Mezirow's (1994; 2000) theory of transformative learning. The journey to transformative manifestation depends on each person's style and preference. Attention to self-reflection, relationships, ethics, aesthetics, religion, nature are some possible choices which flow from this focus of life which is abundant with differences, richness, and diversity. Thus, the transformative drive enriches the quality of human life.

The *transcendental manifestation* of the inner journey towards the truth describes the inclination of a human person to rise above habitual patterns. It challenges the habitual way of thinking and living because it opens up new horizons where familiar things can be seen in a different light. Such ideas are shared by Palmer (1983) who suggests that traditional education lacks the transcendental aspect that is crucially needed for the spiritual development of students and teachers; by hooks (1994) that education as an inner journey enables transgression – 'a movement against and beyond boundaries' (p. 12); and by Wilber (1997; 1999; 2000) that a deeper, vertical movement of changes is really the transcendence of the self. Thus, new possibilities are discovered because inner limits are expanded and former patterns of thinking and living are questioned. Often one comes to the recognition that everybody and everything has one and the same core. This is the wisdom of heart which Wright (2000) refers to as spiritual literacy.

In general, the existential, transformative, and transcendental manifestations of a person's inner way comprise a vision of how to live a fully human life. All three aspects are dynamically interrelated in a circle or spiral-like process that moves according to each person's rhythm.

Teaching Spirituality

Teaching Spirituality is a metaphor that points to the professional activity of teachers in a spiritually attuned educational process. This metaphorical phrase emphasises teachers' activity in a general but not literal way. As revealed in recent findings, spirituality cannot be taught; it can rather be awakened, nurtured, and nourished. Teaching spirituality is a concept regarded by Harris (1988) as a religious, a sacramental, and a holy act. This finding is closely related to recent

educational studies and discourse about practical implications of religious education (for example, Harris, 1987; 1988), and holistic education (for example, Miller, 1994; 2000; Moffett, 1994; Kessler, 2000; Palmer, 1983; 1998a) which regard education as something more than the sum of techniques, strategies, methods, and content-knowledge. Thus, the process of teaching spirituality is possible by enhancing students' self-understanding of their inner world based on their perceptions, thoughts, and emotions, as suggested by London et al. (2004). Such a teaching process acknowledges dialogical, reflective, creative, exploratory, interactive, cooperative approaches to learning; practices of openness; attentiveness to experience; and sensitivity to the world. It is related to Moore's (1998) notion of organic teaching or the art of teaching from the heart. According to Palmer (1998a), such teaching from within goes beyond techniques and strategies. Likewise, according to Rogers (1989), it is the acknowledgement of the Spirit who is the primary teacher. Such teaching nurtures the spiritual nature of learners. It attempts to ensure learning that is meaningful and significant, as observed by Rogers (1969). It extends institutional borders and reaches beyond the school as the only or the main place where education happens.

Thus, teaching spirituality is not based on activities of instruction. Rather, it is a journey in which new learnings, experiences, skills, attitudes, and responses are created, and in which teachers also are students, and students also are teachers. They both are co-creators of their inner realities, and companions on the spiritual journey.

As well, metaphor of teaching spirituality supports ideas discussed by Postlethwaite (2003) concerning sacred-centred pedagogy in which a teacher is a healer, mentor, and gardener, and where teaching is an organic process that requires the acknowledgement of wholeness, love, orientation to the other, relationship, process orientation, centring, presence and openness. It also acknowledges the communal dimension described by Renteria (2001) which asserts that such teaching builds spiritual community by contributing as 'love providing', connecting as 'love inviting', and guiding as 'love shepherding'. This metaphor is also consistent with Kirk's (2000) ideas about education when he writes of the necessity to recover wholeness, to discuss the meaning and value of human life, and to introduce holistic ways of knowing – intuition, imagination, and empathy – in the educational process. And finally, it is consistent with Llewellyn's (1998) ideas about spirituality in education as being replete with transformative possibilities.

The spiritual dimension of education allows students to engage in activities to know themselves and their true nature, not only with their mind but also through feelings and imagination, to be aware of and to develop their own potential, and to actualise themselves in their particular educational environment. Similarly, it supports the significance of multiple intelligences (Gardner, 1983; 1993), and emotional intelligence (Goleman, 1995; 1998) in education. It confirms that any theme, any study course can be taught spiritually, and that it is not the course that makes the difference but rather the vision, thinking, and teaching of each teacher. This finding suggests that there are conceptual and experiential differences among

traditional (norm-oriented), modern (from atomistic/individualistic to romantic) and postmodern (spiritual, sustainable, holistic) education, and highlights the need for a new paradigm of thinking that is open to spirituality as a dimension of education.

Spirituality in Reimagining and Reconstructing Teacher Education in Latvia

When teachers shared their wisdom during the interviews, they also emphasised their uneasiness, even discomfort in speaking about the spiritual in education with students, parents, or colleagues. They noted their lack of experience in sharing with colleagues as well as the absence of examples of how other teachers implement spirituality in education. According to Wright (2000) the reason why so many teachers are not comfortable with spiritual education is 'not because they view issues as being inappropriate with classroom investigation, but because they feel the lack of the training, insight, knowledge and skills necessary for them to do a professional job' (p. 94). This all suggests that teachers should be provided with opportunities to obtain this experience during their professional or academic studies.

Teacher education has a crucial role in building competency not only in methodology of teaching but also in informing the philosophy of education. The theoretical framework of spirituality as an issue of education points to the educational changes needed in Latvia. There are three major facets that should be introduced in teacher education to reconstruct it according to spiritual principles. The first facet is the *notion of paradox*. Paradox implies an image that can assist teachers in the process of educational changes by revealing how the spiritual dimension is present in education. The second facet is *spiritual literacy*. This facet attempts to go beyond the prescribed curriculum and acknowledges spirituality as a cross-curricular issue in teacher training and education programs. The third facet is *experiential spirituality*. It acknowledges the need to provide practical activities in teacher education programs to nourish teachers' own spirituality. These facets are especially grounded in the literature of religious and holistic education.

It follows that spirituality in teacher education should not be implemented as a theory 'from above.' Rather, in their teacher preparation classes, educators should introduce the image of paradox, the value of spiritual literacy, and spiritual activities which acknowledge their students teachers' inner journey. These foci will nurture diverse ways of knowing, acting, and responding as teachers of religious education.

Image of Paradox

Educational philosophy is changing in Latvia. However, the shift in education from norm-orientation to person-orientation (Beļickis, 1995) is not easy for teachers because it requires the letting go of earlier notions and the welcoming of new

challenges. In this difficult period metaphors and images can be crucial guides, mainsprings, or even messengers of changes. Paradox is one such metaphor which embraces some of the most significant complexities and potentials of education. Paradox can provide a positive image of the state of being in-between and an integration or synthesis of two seemingly incompatible opposites. The image of paradox embodies the encouragement teachers need to face changes since, as Harris (2001) puts it, 'a paradox is an apparent contradiction. ...To create security, we must accept the insecurity that uncertainty brings. To feel comfortable about our future, we must accept the discomfort of learning new skills. Stability ...or peace of mind comes only from changing' (p. 23). Thus, the image of paradox can be used to reimage religious education and to assist teachers' professional growth in this period of change.

In educational discourse paradox is explored as essentially spiritual, for it integrates contradictory polarities, implies 'an ability to see the big picture without missing the details' (Daloiz et al., 1996, pp. 122–123), and envisions the truth as 'a paradoxical joining of apparent opposites' (Palmer, 1998a, p. 62). In discussing paradox, Harris (2001) highlights three main components of security in the contemporary world: the ability to learn continually, the ability to change, and the ability to cope with uncertainty. Paradoxically, these are the main fears of learning often experienced by teachers (p. 22). To make these fears into agents of changes, students should face them while in teacher education programs.

The paradoxical nature of teachers' inner journeys can also be described as an integration of opposites: a teacher as a learner, spirituality as integrated in the secular, 'the realities which limit us are the realities which sustain us' (Moran, 1979, p. 71) to mention but a few. Also, the notion of paradox symbolises the intangibility of the spiritual dimension of education.

The principle of paradox in teacher education should be based on philosophy that acknowledges diverse possibilities, responsible choices, and openness to learn from one's own experience. Paradox in teacher education requires a holistic approach to teaching where balance and interconnectedness of different ways of knowing are utilised, such as activities which foster dialogical, reflective, creative, exploratory and interactive participation.

The paradoxical aspect of education offers a symbol for teachers that can help them to appreciate and adapt to change, uncertainty, instability, even discomfort in education, and to nurture their own inner professional journey in a way that welcomes patience, courage, tolerance, compassion. As Palmer et al. (2001) sum it up, 'authentic education is full of such paradoxes, if we have eyes to see, for it involves the death of old ideas and assumptions and the emergence of new forms of knowing and being in the world' (p. 135).

These various notions of the paradoxical nature of education provide a philosophical base for reimagining teacher education in Latvia and for enabling it to be more open, flexible, and creative.

Spiritual Literacy: Spirituality as a Cross-Curricular Issue

Teacher education of its nature is interdisciplinary. It implies the need to go beyond the subject matter, to acknowledge the spiritual dimension of any course of study, and to nurture critical understanding of spirituality within teacher training and education. This is consistent with Wright's (2004) claim that a critical approach towards spiritual education acknowledges and nourishes spiritual literacy (p. 214). Thus, for programs of teacher education spiritual literacy is a central issue.

Spiritual literacy is not a separate theme or a course of study. Rather it is a cross-curricular issue which addresses metaphysical assumptions about the nature of the animate, inanimate, and ultimate reality, and the competency to nourish one's own and students' inner journey in the light of these assumptions. These assumptions should reflect the increasing plurality of beliefs and experiences of a person's inner journey; as well as concerns about its inner dimension, and the diversity and interconnectedness of reality. Such an interdisciplinary understanding of spirituality is consistent with the post-modern understanding of the human person, as discussed by Griffin (1988; 1990) and King (1998; 2001).

Spiritual literacy helps a person to acknowledge and maintain a relationship with the self, others, environment, natural world, and the ultimate. It gives teachers the necessary skills to 'read' the ultimate core of spirituality, its embodiment, and meaning in a particular socio-cultural situation. Spiritual literacy can help this emerging voice to go beyond the personal, bringing a critical and holistic perspective to the learner. It has the potential to bring a critical and holistic perspective on the development of each student and society in general. Spiritual literacy is the fundamental knowledge that 'always eludes complete fulfillment but never ceases to beckon,' as suggested by Durka (2002, p. 80). For her it implies a basic hunger for goodness and wisdom of how to live well. Therefore, spiritual literacy allows one to live a more fulfilling life because it provides a spiritual perspective of better opportunities, broader meaning, and expanded capacities to enjoy the present and to create a better future. For teachers such development helps to 'empower students to take responsibility for their spiritual lives by cultivating appropriate levels of religious [spiritual] literacy' (Wright, 2004, p. ix).

To foster spiritual literacy in their own study courses, teacher educators should address themes which are concerned with the flourishing of human life. This includes showing how the themes they are teaching are related to the spiritual dimension of human life, and providing a variety of strategies for helping students to make and reflect on these connections. Developmental, cultural, and historical perspectives ensure openness towards personal translation of different issues of spiritual literacy and ensure the critical involvement of students. Recognition of these perspectives can keep teachers from inculcating one particular religious or cultural ideology in their teaching.

This process requires tolerance of ambiguity. As Wright (2004) points out, acknowledgement of ambiguous spiritual and religious experiences 'need not result in a relativistic counsel of despair. On the contrary, such ambiguity should function as an intellectual and spiritual driver of the pedagogic process, spurring the struggle

for religious literacy' (p. 221). The spiritually literate teacher would be able to read and understand this pluralistic reality which, according to Wright, is necessary to avoid a confessional agenda. Thus, while spiritual literacy requires the skills of critical thinking, it does not provide a fixed body of knowledge although the development of knowledge and understanding is a crucial ingredient (Jackson, 2004, pp. 17–18). This aspect of teacher training and education includes the well-known approach of *learning about*, and should be interconnected with another approach – *learning from* (Wright, 2004, pp. 183–190) so as to avoid compartmentalization.

To reconstruct teacher education according to life-giving principles, spiritual literacy is crucially needed for teachers in post-Soviet countries. For example, after a long period of Soviet occupation (1945–1991), religion is now included as a subject in the school curriculum of Latvia. Spiritual literacy would help teachers to invite the common ground and denominational uniqueness of religious beliefs of students in classrooms and to educate their students' tolerant attitude towards spiritual diversity. To do that, all teachers should be spiritually literate, and the development of mastery of this professional skill should be provided in the programs of teacher education and training.

Experiential Spirituality: A Practice of Nourishment of Teachers' Inner Journey

The socio-cultural situation plays a great role in development of teachers' inner world. But the impact of socio-cultural situation can also be destructive, as pointed out by teachers who claimed that the Soviet denial of spirituality still has an impact on the educational philosophy of many teachers in Latvia. Thus, the intentional practice of nourishing teachers' inner journey should be included in the programs of teacher training and education. All teachers need inner work as much as outer work to attain true professional competency. The experience of their own inner development can connect teachers with the inner development of their students and provide practical knowledge to nurture their students' spirituality. Miller (2000) argues that incorporation of the spiritual in education nourishes the inner journey of both students and teachers. According to Palmer (1998a), engagement in spiritual practice can lead teachers towards the core of their own spirituality while influencing their mastery of the subject and their relationship with their students. Similarly, Flake (2000) reiterates that 'it is only when we teachers are in touch with our own transformational processes that we can create learning environments which become the sites of positive transformation for others' (p. 285).

In response to Palmer's (1998a) question: 'How can educational institutions sustain and deepen the selfhood from which good teaching comes' (p. 4), it is proposed that the enhancement of teachers' inner journey could be offered as a study course; a practicum where spiritual journey can be awakened and nourished. As Miller (2000) observed, the nourishment of teachers' inner journey 'requires a radically different approach to professional development. Generally, professional development has focused on: teaching strategies, classroom management skills, the

implementation of new curriculum and student assessment policies. Of course, many of these activities are important but ultimately they occur within the framework of soul' (p. 121).

Miller's notion of the inner life curriculum is based on the practice of contemplation. It comprises the following elements: meditation, visualization, working with dreams, and journal writing. Horwitz (2000) also suggests what she calls the tools for the inner journey, such as freewriting, listening with reverence, ritual, and silence. There are several programs that support the nourishment of the spiritual life of teachers. For example, Palmer's *Courage to Teach* program (Conti, 2002; Palmer et al., 2001) and Kessler's *Soul of Education Passages* program (Conti, 2002) are among those which suggest different ways of involvement in teachers' inner journey. Elkins (1998) and Johnson (1999) also suggest several ways to approach spirituality as an universal human reality. However, it is not necessary to propose a particular kind or number of activities that nourish the inner life of a teacher. How to plan and organise this practice can be left to the directors of each study program. What is more important is to acknowledge the necessity of experiential spirituality and to provide such kind of practice in teacher education programs.

Spiritual practice will have benefits beyond the classroom because, as Palmer et al. (2001) put it: 'Teachers who cultivate their identity and integrity, their selfhood, will become both better teachers and more effective agents of institutional change' (p. 145). Although teacher education cannot claim to be 'a place for extensive self-disclosure but simply a place where we [teachers] can, on occasion, drop the role of teacher and simply be a human being,' it is nevertheless true that 'the more we [teachers] can succeed in this task the more satisfying our job becomes as we [teachers] find we can more deeply connect to our students' (Miller, 2000, p. 74).

Conclusion

The framework presented here emphasises the interrelation between education and religion. It broadens the understanding of both education and religion. Spirituality transforms education to a life-long journey towards the truth which opens up deep and personal questions that lie hidden beneath the daily concerns of educational institutions. Since this journey is a constitutive aspect of education it should be a part of any study course and should be a concern of each teacher. This framework provides the possibility of acknowledging the interrelation between education and religion with spirituality as the bridge between them. In a sense, spirituality cannot be taught, because it is a given human reality, but it can be experienced and nurtured. Educators can nourish spirituality of a learner by the modeling of their own character and behavior, and by celebrating their own life and the lives of students as sacred. Teachers' shared praxis and continuing education should be supported. Also, close connection between schools, institutions of teacher education, and educational policy is recommended. Educational policy makers are encouraged to acknowledge the contribution of teachers' wisdom

to the formation of educational policy. Contemporary pluralist society provides a challenging educational environment. Globalization affects family, school and society. Teachers must be able to read the broad and paradoxical understanding of spirituality and incorporate it in their unique educational settings.

Clearly, the spiritual is not something to be added to education. Spirituality is not a recipe to reach profane goals or even a guarantee to create a harmonious personality (Silkalns, 2001, p. 26). Rather it is an invigorating quality of the whole human organism. Reimagining and reconstructing education begins with teacher. The words of Palmer (1998a) serve to remind as well: 'In our rush to reform education, we have forgotten a simple truth: reform will never be achieved by renewing appropriations, restructuring schools, rewriting curricula, and revising texts if we continue to demean and dishearten the human resource called teacher on whom so much depends' (p. 3).

SANKOFA: AN INHERENTLY RELIGIOUS DIMENSION OF AFRICAN EDUCATION

Roseanne McDougall

LaSalle University in Philadelphia, USA

Introduction

In recent years new emphasis has been placed upon the role and importance of African traditional (indigenous) education and its special place in the curriculum. This emphasis is demonstrated by highlighting how the concept of African traditional education became the focal point in a course in educational philosophy taught in Jos, Nigeria in August of the years 2000 and 2002. The essay explores three areas: context, texts, and life-texts. This essay addresses African traditional education for what it is, namely, a deeply religious component in the formation of the African person and community. The essay argues in favor of maintaining the place of the traditions in present day African education. The terms African traditional education and African indigenous education are used synonymously.

The essay supports the work of other African philosophers of education who have written in favor of a distinctively African form of philosophy of education. For Africans, formal courses in philosophy of education should be centred upon African wisdom rather than adapted from Western models, although Western models do have a place in these courses.

It should be kept in mind that the author of this essay is an expatriate. There is far more to Sankofa than is portrayed in these pages. Hence, it is critical that would be African philosophers of education be trained in such a manner that they can more fully develop the concept of Sankofa than is expressed here (Njoroge & Benaars, 1986). This chapter argues in favor of a traditionally African philosophy of education. It is written with deep respect for the people and culture of Africa, from which the world has much to learn.

Context, part one, describes the circumstances and setting in which the course in educational philosophy is taught. Texts, part two, illustrates the major areas of course content with specific reference to oral, written, and visual texts. The concept

of Sankofa is introduced; it runs as a theme throughout the course. Life-texts, part three, demonstrates student integration of Sankofa by describing some responses and observations regarding the role of African traditional education in the curriculum.

Context

In the spring of 1997 a small international team was entrusted with the task of designing and implementing 'Education for Ministry,' an enrichment programme for Ghanaian and Nigerian Catholic sisters and lay women and men in West Africa. The West Africans serve as catechists, teachers, church workers, nurses and social workers among their own people and in surrounding Chad and Cameroon.

The purpose of the 'Education for Ministry' programme is to provide a series of courses which together provide theological, philosophical, socio-economic, and psychological foundations for young adult Africans engaged in ministry in West Africa. Among the courses offered over a series of four summers are: Ethics & Moral Theology, Educational Philosophy, The New Testament, Church & Sacraments, Women in the Church, Faith & Justice, Islamic Studies, Developmental Psychology, and Sexuality & the Human Person.

The foundational courses strengthen ministerial background and complement the professional education offered at the universities. This cluster of courses broadens and enhances the professional background required by the students who engage in various church and educational services.

'Education for Ministry' is sponsored by the Society of the Holy Child Jesus, a small international congregation of women religious in the Catholic Church. The Society, through its Irish, English, French and American members, has exercised a missionary presence in West Africa since 1930. There were approximately 80 Ghanaian or Nigerian members of the Society living and working in West Africa in 1997. By 2005, the number had grown to about 100. While nearly all of the expatriate sisters have either died or retired in their home countries, the newest and youngest African members of the Society are asking for the same education which had formed the missionaries they so admired. They also want to share the education they are receiving with members of other religious congregations in Africa and with their lay co-workers in churches, schools, hospitals and social centres. While the number of young adult student participants in the program at any one time, is relatively small (usually 25–30 people), their interests are varied and their influence is far reaching due to the strong oral culture among the people of West Africa.

Helen Costigane, a Scottish member of the Society living in England, initially conceived the concept of 'Education for Ministry.' Subsequently both Catholic and Protestant groups serving in West Africa strongly affirmed both its validity and the need for its implementation. The students were very eager to learn, so much so that when the possibility of earning academic credit was found to be impossible, they freely committed themselves to diligent study, reading and writing, as if they were completing a series of credit courses.

The program was launched during the summer of 1998. The Educational Philosophy course was taught in the summer of 2000, and again in the summer of 2002 during the second cycle. The key question which undergirded curriculum planning for the course was: How does an expatriate professor design and implement a curriculum in Educational Philosophy, an essentially Western, first world, European and American discipline, so that it can be a meaningful course with an appropriate cultural fit in West Africa?

African educational philosophers had also raised similar questions. They found significant gaps between the content of the typical (Western) Educational Philosophy course, as it was taught in Africa in the 1980s, and the real-life pertinent themes and issues in African educational philosophy. There was a serious absence of 'African oriented material' (Njoroge & Benaars, 1986, pp. xiii-xiv, 88-100).

The Educational Philosophy course taught at Jos attempted to address the gaps, despite the fact that there was some irony involved; the professor was not African! The choice and use of texts was critical to the curriculum.

Texts

A set of morning lectures built around *Philosophy and Education in Africa* by Njoroge & Benaars (1986) constitutes the basis and structure of the course. The lectures are supplemented by the reading and afternoon discussions of Tedla's (1995) *Sankofa: African Thought and Education* and Ngugi's (1965) *The River Between*. In addition, students who wish to do so may visit the Jos Museum or they may view and discuss three films: *Africa: A History Denied* (1995), *Female Circumcision: Human Rites* (1998), and *Dark Passages: The Atlantic Slave Trade* (1997). While participation in these enrichment activities is optional, every student is present. Finally, students develop an integrating course project (life-text) which interprets the significance of ideas and insights related to the course. A summary of some salient points in the textual material follows:

Three pertinent questions are explored with students fairly early in the undergraduate course in educational philosophy: First, what is meant by 'educational philosophy?' Second, how has educational thought developed in Africa? Third, what is meant by philosophy of education in Africa?

African educational philosophy and thinking has, in fact, developed along three major tracks. Unfortunately, the values of the original, thoroughly African tradition have been regrettably overlooked, both historically over the last several centuries and in the present. In addition, the Western world, for the most part, is largely ignorant of the Muslim tradition in African education. Western ignorance stems from historical and cultural differences between Islam and the West. Unfortunately the African continent has become a setting in which some of these differences have been activated, even to the point of bloodshed. At the same time, some Western

educational philosophers (Meijer, 2002, 2006) today are exploring the Muslim points of departure in education. Students of African educational philosophy will some day benefit from the fruits of their labors. The Western tradition in African education entered Africa with European colonisers. While ostensibly designed to improve the lot of the African people, Western traditions in education have also been instrumental in the subjugation of Africans.

Paradoxically, traditional African education is the most poorly appreciated tradition on the contemporary scene. The concept of philosophy of education in Africa existed long before the Western world's development of the field. African traditional customs were transmitted by word of mouth down through generations and long before the development of written Western literature on the philosophy of education. It is erroneous to hold that African traditions are of lesser value because they did not employ the phrase 'philosophy of education' or because they were oral rather than written traditions. It is time for Africans to reclaim the place of their traditions in education on the world stage of the development and value of educational philosophy. This is particularly true with respect to the importance the earliest traditions in education hold for the African people.

The term 'philosophy of education' in Africa connotes not only the earliest traditions, but also contemporary developments in education with special emphasis upon political speeches and governmental committee reports. The present day philosopher of education needs to try to hold both ancient and new meanings in the balance (Njoroge & Benaars, 1986, pp. 35–82).

Historically, African educational thought has developed in rich and varied ways. The traditions in African education predate the Muslim and Western colonising traditions in education. Through classroom lecture and reading, the undergraduate has the opportunity to explore each of these three major traditions in African education. Students find that the history provides them with a sense of perspective. They are most particularly interested in their respective ancient tribal traditions. They also find descriptions of more recent types of educational thought to be helpful, as they are often knowledgeable about a variety of views both conservative and radical.

African philosophy of education in the formal sense, as the Western world understands it with written literature, began in the early 1960s and so it is relatively young on the continent. By the 1980s J. Akinpelu (Nigeria) had written *An introduction to the philosophy of education* (1981). Later in the 1980s, Njoroge and Benaars (Kenya, 1986) developed a synthesis based upon their analysis of methods of academic philosophy, approaches to philosophy of education, and trends in African philosophy. Initially, they proposed and explained four models of African philosophy of education derived as much from the literature as from their own work:

'Ethno-philosophy of African Education' is concerned with traditional educational thought in Africa. The philosopher employs speculative reflection, in order to derive implications for African educational thought and practice (Wandira, 1972; Ocitti, 1973).

'Phenomenology of African education' describes and explains the individual and collective examples or cases (phenomena) of African education through existential philosophical reflection and language (Freire, 1972; Ocaya-Lakidi, 1980; Nyerere, 1980; Erny, 1973; 1981).

'Philosophical critique of African education' focuses on issues found in critical pedagogy, political philosophy and social philosophy (Machel, 1974; Cabral, 1975).

'Philosophical analysis of African education' analyses educational thought in Africa as it is expressed in educational policies, documents, syllabi and practices (Njoroge & Benaars, 1986).

The synthesis developed by Njoroge and Benaars constitutes a foundational framework upon which African philosophy of education may be built. Having developed this synthesis, these educational philosophers then argue in favour of a dynamic existential approach to the study of African educational philosophy which incorporates elements of analysis and critique (Njoroge & Benaars, 1986, pp. 89–96).

While class lectures revolve around Njoroge's and Benaars' development of a distinctively African educational philosophy, students are engaging in a more detailed exploration of the nature of African thought through Tedla's explanations and descriptions: Indigenous thought reflects fundamental unity as expressed in the arts, crafts, oral tradition, and symbols. Traditional African thought affirms life, the individual person, work and a connected, organic sense of community (Tedla, 1995, pp. 17–41).

The readings from Tedla amplify the historical background and epistemological framework presented by Njoroge and Benaars. The Enlightenment, Western Liberalism, Empiricism, Deism, Social Darwinism and related perspectives on knowledge and the environment have destructive implications and consequences for the African continent. Africa's people, natural resources, and economy bear the destructive brunt of Western approaches (Tedla, 1995, pp. 79–108).

In this context, an expatriate professor can only point to the inherent meaning of African traditional ways as described in the text. As this emphasis is occurring, the experience of the student is quite different from that of the instructor. On the one hand, the professor reads, understands and explains conceptually that African traditions are both educational and deeply connected with human life and with the universe. The traditions form an organic integrated whole spanning an individual's life from before human birth and beyond death. The traditions are an essential aspect of the community's existence. They involve lifelong teaching and learning. They impart holistic ways of knowing and they embody African traditional wisdom, Sankofa. On the other hand, the reading, reflective African student knows experientially, the deep significance of the traditional ways. Even the student whose previous education excluded or belittled the traditional ways experiences a reawakening to the reality at the core of one's being: *One is African!* Being African means being alive, gifted and strong in ways which constitute a worldview uniquely different from the Western perspective.

As students read about personal character development, the skills, concepts, and content of ancient traditional ways, and about how the Amara Welloye people of Ethiopia implement traditional African education, they begin to change. Their involvement and interest in the course begin to mount as they experience increased intellectual and emotional awareness, brought about through explication of traditional African thought in the Amara Welloye setting (Tedla, 1995, pp. 149–165). While they are reading about the traditional practices of the Amara Welloye, they are recalling their own.

For many, African traditional ways are part of the remote past. They are surprised and overjoyed when conversation about traditional ways brings a sense of life and vitality to birth within their own consciousness. They experience a newly found alertness to course material and engagement with one another.

With Afro-centricity as the chief criterion (Tedla, 1995, pp. 167–206), students read and reflect for themselves upon the qualities of present-day African education. Some findings include the continuing presence of subtle styles of subjugation, emphasis upon the individual to the neglect of community, insufficient skill-based education (i.e., in nursing, or engineering), inadequate amounts of time for formal education, lack of education for women. Tedla (1995, pp. 209–219) proposes African oriented ‘Sankofan Education.’

Sankofa is a term from the Akan tribe of Ghana. Taken literally Sankofa means ‘Return to the Source and fetch.’ A Sankofan approach looks to the early inspiration in one’s culture, heritage, and traditions. Then the Sankofan orientation interprets and applies the principles in one’s background to the present in such a manner as to find significance and direction. The Sankofan approach is not rigid or stuck in the past. It rather integrates the best of traditional education with what is necessary and helpful in contemporary models, both within and outside the continent. Such integration has the potential to reclaim African history (particularly that which has been omitted or distorted), to retain the uniqueness and life of the distinctively African culture in the world, and to empower the African people (Tedla, 1995, p. 1).

A careful reading of Ngugi’s *The River Between* (1965), set in the Kikuyu area of East Africa, allows students to penetrate more deeply, through fiction, into the conflicts between the traditional African way of living and the patterns imposed by colonialism, particularly in the realm of religion-sponsored education. Muthoni’s desire to participate in the ancient tribal customs of her people offers a powerful illustration of the conflict which can develop as Africans long to connect with their ancient traditions (Ngugi, 1965, pp. 23–27). Class discussion becomes more active. The link between theoretical concepts and the students’ lived-experience becomes more direct. Some begin to realise the impact of what others already know: not all that the ‘colonial masters’ did was good for the African people. The harsh reality begins to take root in the students’ minds; nevertheless, they hold fast to their newly increased pride in being African.

Through the visit to the Jos Museum, students link what they have been hearing and reading about ethno-philosophy with the experience of seeing and observing very ancient pottery and other traditional tools and artifacts. They learn that the

oral history of the geographic area in which Jos is situated (Plateau State) extends back to an ancient civilization dating from about the year 400. The realization is awesome as they connect with the past customs of the environs.

A course unit entitled 'Roots of Ignorance towards Africa' illustrates the shaky foundation upon which some Western attitudes towards Africa are built. Through questionable interpretations based upon Genesis 9:18–10:32, Isidore of Seville's (d.636) *Etymologie* 8, 3, 2–3 (in Brehaut, 1964) and *Journal of the Discovery of the Nile* (Speke, 1864, pp. 224–225, 242–243, 494–496) one can trace the development of past demeaning attitudes towards Africans. Today such attitudes would be called unconscionable. In this context, *Africa: A History Denied* (1995) is shown. The film portrays the tragic despoliation of the African continent by outside countries. Earlier readings and discussions had prepared an informed audience whose viewing of the film leads to a more vivid realization of the effects of colonization than previous class activities had succeeded in doing. The portrayal of the richness of ancient African cultures affirms and strengthens the validity of the concept of Sankofa. While *Africa: A History Denied* (1995) clarifies some of the roots of Christian ignorance towards the African race, it also documents the entry by Muslim nations into East Africa. More could be done in an educational philosophy course such as this one to illustrate the Muslim contribution to education in Africa.

Since the tradition of female circumcision is a key element in the unfolding of Ngugi's *The River Between* (1965), the film *Female Circumcision: Human Rites* (1998) provides an avenue for sometimes curious and sometimes heated discussion of the practice. There is reverent, delicate discussion between female students and male students. Their faculties for critical analysis are sharpened as they adamantly question to what purpose such a film is used in the Western world, to what degree the actresses are willing participants in the production of the film, and to what extent just compensation is provided for them. Despite the pain *Female Circumcision: Human Rites* (1998) evokes, there is a sense of increasing ownership of African pride among the students.

Dark Passages: The Atlantic Slave Trade (1997) is a powerful documentary. On the one hand, it is a fitting sequel to *Female Circumcision: Human Rites* (1998) with its ability to evoke pain, passion and pride. On the other hand, there would be some wisdom in having an African professor introduce the film, reflect on it in silent reverence with students, and process the content with them. Despite the raw emotion which the film has the potential to elicit, students say they prefer to know the reality of the African continent vis-à-vis the rest of the world rather than remain ignorant. They want to act as world citizens with African pride!

Those who reflect together upon *Dark Passages: The Atlantic Slave Trade* (1997) experience a painful burden. The eyes of their understanding have been opened. It is difficult to accept the past. As students continue to work together, their cohesiveness deepens, and their pride in being African reaches a high point. Then a new dynamic enters the conversation. It is as if scales have been lifted from the students' eyes. Many experience a hunger to appropriate the traditions of African traditional education as they apply to themselves, to their particular tribe, from their

particular village. At the same time, there is a newly developing appreciation for the traditions of African education as they apply to the other students enrolled in the course. Interest in one another's cherished customs deepens. Further, there is a desire to acquire a solid grasp of Western traditions in education in order to become as fully equipped as possible to meet emerging contemporary needs. Finally, there is a desire to share newly found knowledge with other Africans.

Life-texts

During the culminating activities of the Educational Philosophy course, students create their own individual presentations and/or small group dramas as ways of demonstrating their understanding and interpretation of course content. In addition, students voluntarily write short pieces which have particular personal significance. Finally there are anecdotal comments which give rise to the word 'life-texts' as subtitle for this final section of the chapter.

Specific forms of pedagogy serve as the focal point for the individual presentations and small group dramas. For example, one student dramatically describes details of the wedding preparations and ceremony for a Yoruba (Nigeria) couple with attention to its pedagogical aspects and its view of women. In another case, a small group dramatises how a concerned group of citizens might go before the board of education in order to argue the case for incorporation of traditional ideas in education into the present-day African curriculum. The presentations/dramas not only demonstrate student appropriation of course material (often with lively humor), they also elicit a keen interest on the part of observers, most of whom are other students in the course. The result is a deepening interest in and appreciation of one another's specific tribal setting with particular focus on its traditional pedagogical foundations.

Openness to the particular tribal setting of another builds upon the common foundation of the traditions. The tribes share common goals in their approaches to education: to develop latent physical skills, character, respect for elders, intellectual skills, and vocational skills; also, they want to encourage participation in the community and to promote the community's cultural heritage (Fafunwa, 1982, pp. 11–12). Many Africans believe in the social character of traditional education and in its capacity to impart progressive achievement (Moumouni, 1968, p. 15). By the very fact of being African the students share a common base in their traditions, for example, the naming ceremony of a newly born infant. Interest in the traditions of those in other tribes builds upon the common foundation each person shares in coming from a background rooted in such customs. While just a few brief examples are offered above, the sharing can be very rich, with variations in custom and tribal background.

Some students voluntarily develop their own creative work after completion of the course. One reflects upon traditional forms of education in the curriculum in a carefully researched paper 'Should Indigenous African Education and Thought be Wholly Incorporated into the Modern African Educational Curriculum?'

(Owuamanam, 2000). Specialised expertise as preparation for life in stratified African society, rites of initiation, and folklore are reviewed as forms of traditional education. The author argues in favor of traditional education due to its moral elements, its focus on the child, its flexibility to be both informal and formal, and its discipline. Traditional education is geared towards set roles for girls and women, a major drawback, whereas Western education tends to offer more opportunities to women. This problem with traditional education is acknowledged, but not addressed. The author concludes by favoring traditional education because it fosters the development of the total human person, strengthens character, provides intellectual and vocational training, and conveys a sense of belonging to the community (Owuamanam, 2000).

Sylvia Enendu, another student, writes a free-verse reflection (Enendu, 2002) upon the meaning of Sankofa evoked through course readings and conversation. After describing some images and effects of life in the modern world and her own subsequent search for meaning, she is drawn back to the influence of her grandmother, Nneochie. Being drawn back ultimately means to go forward:

Where Have I Been?

Immersed in thought I wonder where have I been?
I ask myself, again and again, where have I been?
Confused, disturbed, whirling deep within myself,
Where have I been?
Am I lost? I ask myself, have I lost myself?
Where am I? Where do I meet myself? Who am I?
I have wandered far and wide,
Gone to far flung places, danced to the piano,
Clinked glasses, the sound of false laughter familiar to my ears.
I have left myself behind.
Ah! In what places I have been!
Yet hollow to my inner self, to the core of myself.
I am searching,
Searching and searching!
Perhaps I can find myself.
Will you help me find myself?
Light shines showing me the way.
The light of these past few days with you and myself beckons me.
I move forward, towards it.
Yet I look back to where I have been.
Will I go back?
Still you call me, 'Mgbokwo.'
Nneochie calls me, 'Come and learn wisdom from my breasts' she says.
I move forward,
To where I was born.

The two student-authors each communicate individual and quite differing reflective responses to the notion of traditional African education. They exercise both intellectual and imaginative breadth and depth. There is a sense of authenticity evident in each work.

During both summers (2000, 2002) some students commented that it is difficult to live in present day Africa because there are two 'scripts' running in their heads: that of the African and that of the modern world. One must often attempt to ignore one 'script' in order to think and act out of the other. When confronted during the course with words describing the differences between traditional thought and education on the one hand, and present day experience on the other, students recognise the phenomenon of the two 'scripts' all too well. Afterwards they begin to use their own African vocabulary which is richly descriptive and vivid. Classroom conversation takes on new life.

Again, during both summers, new thoughts and images arise in the minds of some students. Without describing the thoughts and images, they state that the thoughts and the images are both unprecedented, yet very familiar. Ruminating over the new, which is somehow familiar, brings beauty and peace.

One is left with the impression that there is considerably more to Sankofa than it is possible to explore in an introductory course. Hopefully the introductory course will serve to interest Africans educators in further study and teaching of educational philosophy. It will be the African philosophers of education who will be able to open up the riches of Sankofa as a fundamental source of wisdom for their students.

Implications

In Africa today there is a high premium placed upon education and upon its potential for the African people. Within this context, educational philosophy is understood to be very important, particularly in the realm of teacher training. Nevertheless, diverse meanings and interpretations are attached to the term educational philosophy. This essay describes experiences in which African traditional wisdom is honored for what it is, namely, a contribution, which is deeply religious, philosophically based, and formative of the African people. It predates formal Western philosophy.

While there is considerable literature on African traditional customs, religions, philosophy, and education, Njoroge & Benaars (1986) rightly demonstrate the absence of literature describing genuine African philosophy of education. At the same time, they make a case for the existence of such a genuine African philosophy of education. They lay a foundation and develop a framework for an African philosophy of education. Tedla (1995), drawing upon her research in the Akan traditions (Ghana) and with the Amara Welloye people (Ethiopia), contributes to the need for literature by demonstrating the implementation of African educational philosophy in a single tribe, the Amara.

Both Njoroge & Benaars (1986) and Tedla (1995) demonstrate an integration of African history with global history. More recently, Okrah (2003) contributes along

similar lines to the literature of African philosophy of education in his analysis of three particular elements in the Akan (Ghana) culture: folktales, proverbs, and art & symbol.

There is validity in discussing an 'African' philosophy of education because being African is a distinctive way of being in the world. At the same time, there is a need for continuing specific tribally oriented research and scholarship similar to that undertaken by Tedla (1995) and Okrah (2003). African students want to know about the traditional wisdom of their particular people.

The material developed by Njoroge & Benaars (1986), Tedla (1995), and Okrah (2003) provides a clear literary framework for present day study of African educational philosophy. However, students of their work would be assisted by a collection of individual studies based upon traditional customs and their place in African educational philosophy. An anthology of primary source readings in African traditional education would complement the work already done. Brown and Hiskett (1976) orient the expatriate to traditional forms of education in various regions and tribes of Africa. Nevertheless, there is need to develop their study further, that is, to penetrate more deeply into the wisdom and significance of the traditional forms. Only the African can work towards this task.

The anthology of primary source readings would fill a need in the educational philosophy course. There is little available in an accessible form to serve as a companion piece to one of the framework texts. For example, West Africans want to read the works of contemporary Ghanaian and Nigerian educational philosophers. They want Sankofa, as experienced within their tribes, to find its way into the literature where it deserves a rightful place.

Life-texts, the responses of students to traditional course materials, presented earlier in this essay, offer a strong rationale for the compilation of an anthology of readings in African educational philosophy. The life-texts suggest that African traditional wisdom continues to have perennial value and meaning, particularly within the field of educational philosophy.

RELIGIOUS EDUCATION AND PEACE EDUCATION: A PARTNERSHIP IMPERATIVE FOR OUR DAY

Dr. Linda L. Baratte

*Centre for Theological and Spiritual Development, College of Saint Elizabeth, Morristown,
New Jersey, U. S. A*

Introduction

‘And all thy children shall be taught of the Lord;
and great shall be the peace of thy children’ (Isaiah 54:13).

One of the key and disturbing insights from ‘reading the signs of the times’ is not only how religion has continued to be a source of conflict among peoples but how it has been complicit in giving a sacred patina to the violence, terrorism, and atrocities in our day that seem to know neither ends nor boundaries. Recent arguments in the United States Supreme Court in favor of the constitutional validity of the phrase ‘one nation, under God’ in the country’s Pledge of Allegiance belie the power of religion to divide families, communities, and nations. Palestine and Kashmir, Bosnia and Kosovo, Northern Ireland, Iraq, and the Sudan – names that scroll along the bottom of cable news television channels serve as sad reminders of how contemporary clashes of civilization are predicated on and fueled by religious conflicts. Sectarianism, bigotry, fanaticism, *and* religion are each factors in community strife; each has been used as an imprimatur for the most destructive, heinous expressions of our humanity.

Educating for peace and justice becomes a crucial imperative of any curriculum for religious literacy in the 21st century when lines separating patriotism, zeal, and religion are dangerously blurred, when ‘nation’ or ‘ideology’ is militantly embraced as a privileged locus of God’s plan of redemption in human history. Religious educator Mary Boys writes that an epistemology fundamental to any religious education must be a stance to ‘dilate our sense of the world’ (Boys, 1989, p. 159) (Boys credits Huston Smith in *Beyond the Post-Modern Mind*. NY: Crossroad,

1982, p. 87 with this phrase). How can religious educators help to dilate a sense of the world where pathways to peace and mercy could be paved with more purpose and hope? How can religious education help to forthrightly address the tension between the evil in human history that is aborning in the present moment and the honoring of the dignity of the human person that is fostered and celebrated in all religious traditions? How might they teach not only the meaning of peace and justice but how peace and justice can be lived and achieved?

The unholy alliance between religion and violence stands in stark contrast to the human need for peace and the value of peace universally shared by every religious and spiritual tradition. The Hebrew concept of peace, or *shalom*, informs both the Hebrew and Christian testaments, for example. Peace is not a 'mental state' of the individual; rather, it is a way of life, a communal state of well-being and wholeness and a public harmony embodied in right relations with God, creation, and others. The Christian scriptures teach that Jesus is the fullest expression of the reconciliation between God and creation. 'Christ is our peace,' writes the apostle Paul to the Ephesians. His witness points to one new, indivisible humanity – a new dwelling place for God. For Christians, a response to the call to this life of apostleship must be to seamlessly reflect the unity and harmony and a stance for righteousness that are the hallmarks of the new creation. In fact, as one Christian spiritual writer argues, 'Jesus insists that making peace so deeply reflects the character of God that those who do so are called 'children of God'' (Kenneson, 1999, p. 86). The Roman Catholic Vatican II Council in its deliberations in 'The Pastoral Constitution on the Church in the Modern World' affirmed that peace is not merely the absence of war but an enterprise of justice and the fruit of love (Flannery, 1992, pp. 986–987). In each religious tradition, peace is both gift from God and something to be yearned for and pursued. Religious educators are in a privileged position to bring to bear a professionalism and passion that may make that peaceful enterprise a possibility in the present day.

A Curriculum for Peace

One of the first tasks for religious educators who would call their communities to a stance for peace will be critical reflection – a recognition that faith-inspired terrorists can find in their religious tradition and history both texts and role models that give legitimacy to their own use of violence. Religious leaders must forcefully denounce the complicity of religion in giving any kind of sanctioning to the use of violence to protect or to promote their own sectarian interests. As one scholar dedicated to interfaith dialogue notes:

When the activities of those who preach, teach, and operate in God's name are associated with fanaticism, cruelty, or murder, the divine name is desecrated. Such behaviors reduce the credibility of all religions. Therefore, no religion should be exempt from this effort to stop the violence.... All religions have

become tarnished by the idea that increased devotion to God morphs into claims of absolutism, which easily translate into intolerance and violence (Greenberg, 2004, p. 89).

This task will mean a more forthright commitment to culling out both the theology and history of peacemaking and obstacles to peacemaking within each tradition. Religious educators will be called to name with more intentionality the resources within their traditions for the work of peace, justice, and reconciliation and the affirmation of religious pluralism and respect for differences (see, for example, Harold Coward and Gordon S. Smith, eds. *Religion and Peacebuilding*. Albany, NY: State University of NY Press, 2004). Part of that process will be the probing of the ethical re-evaluation of war by modern theologians, moral philosophers, and social thinkers and making accessible competing ethical claims, recognising that peace may be a 'contested field of theological ideas' even within the tradition. Witness the stance of just war theorists and pacifists each claiming a home within Catholic social teaching and ethical demands for peace, for example.

Equally imperative will be an exploration of peace among nations through positive appreciation of other religious traditions and their potential to be religious sources of peaceful social transformation. Typical of the rich panoply of several timely resources which invite this exploration are *Has God Only One Blessing? Judaism as a Source of Christian Self-Understanding* by Mary C. Boys; *Beyond Violence. Religious Sources of Social Transformation in Judaism, Christianity, and Islam* by James L. Heft; and *Liberating Faith. Religious Voices for Justice, Peace, and Ecological Wisdom*, edited by Roger S. Gottlieb. Religious educators recognise, however, that inter-religious awareness cannot rest merely on ecclesial good manners. As one religious educator experienced in interfaith communion has written:

To reduce their violent tendencies, all religions must now take upon themselves the commitment to a thoroughgoing radical pluralism. Religions should insist on pluralism in religious life, and in economic, political, and social life as well as in culture, to protect against their own totalising tendencies.... The potential gain is that faiths learn to witness effectively in the presence of the full dignity of the other. This would pave the way for a plurality of positive, credible models of faith enriching and correcting each other – preserving abuse and violence on the part of any one privileged faith. Pluralism is the only surefire way to achieve a balance of power in which all religions are encouraged to act ethically (Greenberg, 2004, p. 106).

A respect for religious pluralism cannot be achieved by religious educators in an illusive search for an homogenised consensus but only as they embody in a fulsome way the peacemaking core of their religious heritage. As two pioneer educators in the advocacy of interfaith dialogue have written, 'The road to understanding the role of spiritual traditions in advancing teachings about peace is thus not *around* the distinct cultures in which such teachings are born, but rather *through* them to a ground that demands of all of them the supreme effort to turn to one another

in dialogue' (Gordon and Grob, 1987, p. 8). Added to the agenda for educating for peace will be formation in the openness required to engage in a pro-active, celebratory endorsement of pluralism and diversity in culture and religious belief and practice – an epistemology 'beyond tolerance' where skills in listening, dialogue, and discernment are developed and both the predisposition and opportunity for discovering and affirming the religious truth in the other are celebrated.

Skills learned in this kind of an invitational religious education—the interpretation of experiences and attitudes, the critical questioning and examination of implications, and the embracing of new connections between tradition and transformation—act as a counter to the indoctrination that is the foundation on which 'holy war' violence first takes root. Faith can grow and deepen as it is illumined by the other. As two theologians committed to this stance have written:

Until people of different faiths feel they are fully equal in their humanity and so all have things to teach and things to learn, the anthropological foundations of effective dialogue will still be missing. Until people of different faiths feel God has addressed them all and so all have religious wisdom to teach and religious wisdom to learn, the theological foundations of effective dialogue will still be missing (Carmody and Carmody, 1988, p. 8).

This is the taproot of the work for peace and justice and the reconstitution of our broken world—the foundation on which true collaboration among persons of faith must rest, they argue.

Several resources are available for religious educators who commit to making skills and experience in inter-religious dialogue an essential part of religious education in their faith traditions. *Sharing Shalom. A Process for Local Interfaith Dialogue Between Christian and Jew* (Cunningham and Starr, 1998) is one fine example designed for use in an interfaith adult education experience. Included in the book are rich, informative essays (an exploration of Jewish and Christian understandings of the Messiah, for example) and a Leaders Guide, plus questions for discussion and a prayer service for each unit. Other resources to meet the same curriculum goal are David Sandmel, et al. 2001. *Irreconcilable Differences. A Learning Resource for Jews and Christians*. Boulder, CO: Westview Press and Judith A. Berling, *Understanding Other Religious Worlds*. NY: Orbis, 2004. A free study guide for fostering Christian-Muslim dialogue, 'Do Christians and Muslims Worship the Same God?' can be downloaded from www.christiancentury.org. Theologian and religious educator Dr. Reinhold Boschki of Tübingen University has authored several articles appropriate for adult education groups where the writings of Elie Wiesel prompt exploration of memory and reconciliation as wellsprings of a peaceful future (see, for example, 'Education After Auschwitz. Over the Practical Dimension of the Christian-Jewish Discussion,' *Church and Israel*, 1:1992; pp. 83–91 and 'Remind by Telling. References to the Use of the Texts of Elie Wiesel in the Work of Memory' in Albert H. Friedlander, et al (eds.), *Elie Wiesel. The Six Days of the Creation and Destruction. A Book of Hope*, pp. 111–119).

A number of case studies chronicling the exciting international ventures in inter-religious initiatives for peace bespeak of other religious education needs as well. Religious nongovernmental organizations such as Caritas International, the Gandhi Peace Foundation, the International Fellowship of Reconciliation, and Lutheran World Service, plus national and transnational religious communities, ecumenical and inter-religious bodies, and other expressions of para-ecclesial movements have each made a profound contribution to nonviolent social change and reconciliation on the international scene, bringing to bear the need for new skills in conflict mediation, management, and resolution. In August 2000 more than 1,000 representatives of transnational as well as indigenous religious traditions gathered at the United Nations for a Millennium Summit of world religious leaders. The summit heralded the world community's 'unprecedented recognition of religious peacebuilding as a viable option, as well as a new willingness among religious leaders and organizations to play a defined role in an integrated, multilayered approach to peacebuilding' (Little and Appleby, 2004, p. 3). Preventive diplomacy, election monitoring, advocacy of legal and human rights, education and training, resource and crisis management, refugee resettlement – these are the new 'job descriptions' required to show leadership in a complex process of social, political, and religious change, what Scott Appleby labels religious peacebuilding through transforming conflict and restructuring society (Little and Appleby, 2004, p. 2). How are our faith communities inviting their congregants to develop and place these kinds of skills at the service of Church and world? Religious educators will be a part of the invitation and the response.

Part of the curriculum for religious educators is also the need to ferret out new partners and new venues in an advocacy of peacemaking, thinking relationally, cross-culturally and cross-religiously in allocating and marshalling financial and human resources. Building concordances and educating in collaboration with transnational and interfaith civic groups working for peace is one way that religious educators can model a non-hierarchical leadership style dedicated to using power in an integrative, nonviolent stance that invites others to work for the common good and the moral purpose of peace. More ecumenical outreach in the founding, sponsoring, linking, or transformation of centres for peace and justice may be one tangible to embody religious peacebuilding at the local level.

Organizations such as Pax Christi, Bread for the World, Amnesty International, death penalty reform groups in the United States, and other centres for peace and justice carry tremendous educational power and potential through their newsletters, internships, speakers bureaus, conventions, lobbying, and advocacy information packets and through prayer vigils, rallies, and other kinds of symbolic activity. Religious educator Mary Boys might describe these organizations as 'a vision of faith transforming culture; their praxis orientation...suggests that true knowledge is transformative. They place emphasis not only on theological understanding but also on the skills of social analysis. Staff members of peace and justice centres are often leaders in the production of curricular materials and generally are committed to dialogical and process-oriented pedagogues' (Boys, 1989, pp. 140, 213). A 2003–04

publication catalogue 'Resources for Countering Violence and Fostering Justice' from Pax Christi (an international Catholic peace advocacy group) illustrates Boys' insight.

The Institute of Peace and Justice and the Parenting for Peace and Justice Network, both coordinated by religious educators James and Kathy McGinnis, are two examples. The Institute is an independent, interfaith organisation founded in 1970 as a response to the realities of war, racism, and global injustice. The Network is an interfaith, transnational association of families who recognise that the 'well-being of our families is tied to the well-being of our global family and the earth itself.' Both organisations produce a wealth of information on public policy issues on war and peace, coupled with skill building to foster peace in families and communities.

Educators for Social Responsibility (ESR) is another organisation ripe for partnering with religious educators. ESR is a non-profit organization based in the United States providing resources and curriculum for educators helping young people to develop the convictions and skills needed to shape a safe, sustainable, and just world. Programs, packages, and publications offered by ESR are designed to nurture the ethical, emotional, and social development of children through leadership in conflict resolution, diversity awareness, violence prevention, character education, and intergroup relations. Using these resources, the 'values questions' challenging the very bases of the social order that make peace education so controversial in a public school setting in the United States could be explored unabashedly in an environment where religious education is the goal.

Universities can also be a source of collaboration, consultation, and professional development for religious educators. The Centre for Christian, Jewish, and Muslim Understanding at Sacred Heart University, Fairfield, Connecticut, USA, the Masters of Arts degree in Jewish-Christian Studies offered by Seton Hall University, South Orange, New Jersey, USA, and the Global Ethic Foundation in Tübingen, Germany (www.global-ethic.org) are three examples of the number of academic institutions committed to inter-religious research and education through programs and publications.

Peace Advocacy in the Public Square

The commitment to this curriculum for religious and peace education—what educator Dieter Hessel names as a pedagogy demanding 'a critical consciousness and hopeful vision that ennoble[s] [us] to evaluate events and act courageously to change dominant systems, encounter fresh claims and ideas of justice, and work for *shalom*' (Hessell, 1982, p. 111)—brings into sharper relief the political implications of all education. A common theme in the writing of religious educators is that educating for peace and justice must also lead to public advocacy and public action beyond the life of the congregation.

In *Fashion Me a People* (1989) the late religious educator Maria Harris used the call to advocacy – the speaking out in the face of injustice – as an example of the

multiple nature of educational ministry, a call infusing each of her five curricular forms. (In an earlier work, Harris (1981) had described *kerygma*—word enfleshed in speech—as a ministry of advocacy, a ‘pushing back boundaries, taking on unpopular positions, and often speaking the word that no one wishes to hear.’ In this work Harris defines *diakonia* as a ‘ministry of troublemaking.’) Responding to that call as religious educators requires expression in the prayer, teaching, worshiping, and serving life of the community of the faithful, as she claimed. There is an advocacy dimension to all of schooling and community life, just as any stance of advocacy and prophetic speech must be girded by the prayer and worship life of the community. In Harris’ schema, one natural and welcome expression of the intersection of the curriculums of *diakonia* and *kerygma* must be a commitment to what she terms social legislation – political advocacy that would work to identify and change the systems and structures that perpetuate unjust conditions (Harris, 1989, pp. 152–155).

Mary Boys spells out the role of advocate—rallying others to a cause—as one way that a teacher may properly provide the resources by which people might come to claim information, concepts, and attitudes in their work for peace (Boys, 1983, p. 99). Religious visions and vocabulary, while distinctive from secular peace movements and ‘politics as usual,’ can contribute as authentic partners in the public-square debates on the morality of war and the mandates for peace. Religious educator Timothy Lines succinctly states the point. ‘Either one does the full work of the religious educator, including the inseparable dimension of change agency, or one pursues another vocation entirely. Genuine religious education and unquestioning acceptance of the status quo are incompatible partners. One will have to subsume the other,’ he argues (Lines, 1992, p. 366). Religious educator John Elias emphasises this same idea in his essay ‘Religious Education for Power and Liberation. ‘A liberating religious education ultimately demands what he terms ‘politicization’—the immersion in the social, political, and economic realities where faith is forced to flourish. Religious education, he contends, ‘will attempt to bring people beyond the point of critical awareness to the point of action against injustice. ...Jesus’ teaching is political teaching, concerned with how men and women are to live and act together, not with men and women in isolation’ (Elias, 1986, pp. 170–171).

In religious educator Suzanne Toton’s work *World Hunger* (1982) an example can be found of the carefully crafted intersection of advocacy and religious education called for by Boys, Lines, and Elias. In a withering analysis Toton examines the inextricable link between decisions of the economic, social, and political systems in what she labels the First World and the crushing poverty in the Third. Her larger message: education in general and Christian religious education in particular have responsibility to effect systematic and structural change for peace and social justice. Using the methodology of political and liberation theology, Toton unveils through critical analysis and reflection the ‘good news’ of the Christian religious tradition. The gospel is a public and political summons, she contends. Faith cannot be lived ahistorically nor apolitically. The freedom, peace, justice, and love Jesus spoke of are concrete realities, calling for social, structural, and political expression. Toton

goes on to critique the role that religious institutions have played in maintaining the status quo, and then mines the biblical tradition as an imperative for religious educators in developing a contemporary Christian social consciousness and an agenda for systemic social change. Toton's work stands as a pointer to how religious, ethical and moral imperatives can be expressed in a pedagogy of advocacy. The ill-placed hierarchy of values implied in the First World/Third World dichotomy is a part of Toton's critique. Toton confines her analysis and admonitions to the Christian tradition, it should be noted. There is no specific reference to the concern for social justice that could be a source of fruitful ecumenical dialogue and action.

Conversation Partners for Peace

As religious educators develop a curriculum for peace and look to collaborators in that sacred venture, scripture scholar Raymond Brown's classic work *Religion and Violence* offers an important admonition. Recognising that war, with its overt physical acts of destruction, is only the most obvious example of violence in our day, Brown broadens and deepens the scope of 'violence' to include what he labels the subtle forms of violation of personhood and human dignity and the suppression of human potential that characterise the systems, structures, and institutions of society. He writes:

It is linguistically proper to speak, for example, about the violence *of* the slum – not the violence *in* the slum, but the violence *of* the slum. The difference between the two phrases is important. It is not enough to say that violent acts, such as mugging, rape, or robbery, take place in a slum environment. The point is that the slum environment, the structure of the slum itself, works violence against those who live within it, even if they never experience the physical harm so often attendant on slum dwelling (1987, pp. 35–36).

His constructs would call religious educators to ever be in close conversation with their pastoral counseling peers—in designing domestic violence prevention programs, for example—and with social justice outreach committees and professionals in continuing to name and confront the violence inherent in oppressive, unjust economic policies and in the sexual exploitation of children and immigrant labor. Those who pray for peace must work for justice, Pope Paul VI admonished.

Church communities themselves as 'systems, structures, and institutions of society' have pedagogical value as they model an ethos of peace through shared power and dedication to a mutuality and collegiality in ministry. As they nurture the spirituality of the vocation of peacemaking of their members, they take on the formative task of linking private piety and public responsibility, personal growth and transformation of social structures.

Another partner for religious educators in the work for peace will be the aesthetic resources that tap the transcendent power of art to shape imagination, vision, and

the possibility of peace. Poems, photographs, plays, and images quicken a deep yearning for a more peaceful world; stories of grace, goodness, redemption, and courage make it seem possible. Witness the power of the two-page display in the *New York Times* of the portraits of the over 300 firefighters who perished in the Twin Tower attacks of September 11, 2001, the almost unbearable sorrow evoked by the rhythmic cadence in the reading on national television of the names of the first 1,000 men and women from the United States to die in the Iraq war, or the poignancy as the wind played through the newly planted Forest of the Absent, a grove of olive and cypress trees commemorating the victims of the March, 2004 Madrid train bombings.

A potent example of the pairing of art and education is Raymond Brown's use of the charcoal drawings of Kaethe Kollwitz in *Religion and Violence*, showing in ways 'beyond words,' as he frames it, the power of love as resistance to the idols of violence and death. Kollwitz had lost a son in World War I and a grandson in World War II. Through her work, she transformed her grief into a passionate commitment to peace and the struggle against all causes of violence and war. Her drawings were so powerful in their condemnation that Hitler's Third Reich labeled them 'degenerate' and prohibited their exhibition. Brown writes:

For while the drawings clearly depict the horrific consequences of war and violence, particularly in their impact on children, they likewise make clear that horror is not the last word...[Reconciliation and peace] are positive goals toward which we too can work and which we can try to embody, even in a world that seems to treat them so cavalierly as our own. If Kaethe Kollwitz could move from negation into such affirmation during the early 1920s in Europe, that is a beam of hope for us in the darkness that surrounds our own time (Brown, vii–viii).

Kollwitz's depictions of the oppressive burdens of grief and despair that are 'collateral damage' of war are among the most poignant images of all 20th century art.

Studying the Holocaust Through Film and Literature (Kassenoff and Menbach, 2004) is an example of several resources for educators which recognise this same power of visual images to inform and transform a stance for peace. Contemporary films and documentaries carry great potential as 'visual parables' and can be particularly effective in adult religious education programs (e.g., *Romero*, *Schindler's List*, *Gandhi*, *In the Name of the Father*, *Dead Man Walking*, *The War*, *Gallipoli*, and *Eleni*, and the newly released *Hotel Rwanda*, *Sometimes in April*, *Spohie Scholl –The Final Days*, and *Coca – The Dove From Chechnya*).

Religious educators also embrace the power of story operative in all religious traditions to shape that transformation, instances where 'individuals are convicted, inspired, and sustained by that which rings true in story, whether the story is encountered through drama, folk tale, great literature, or sacred text' (Friesen, 1986, p. 241). As theologian Terrence Tilley contends, story can provide 'the bridge over which faith moves from the tradition of the community into the life

of the individual' (1990, p. 3). Faith is evinced only in concrete human experience and in the historic imprint of individual lives. As religious educators cull out the dominant faith understandings of a life well-lived and, in the Christian tradition, point to fresh exemplars of the character of Christ, they call their communities to reframe religious imaginations and point to ways they may have settled for thinner, less challenging accommodations. These stories then 'truly become my own story...showing me how to move from the injustice of my life to a justified life or from violence to peace' (1990, pp. 16–17).

The power of the witness of martyrs for peace found in many religious traditions carries particular potency. As one Christian author writes forcefully:

'In the last century alone, thousands gave their lives to keep their faith in times of darkness. They were Christians of all confessions and denominations. Their lives and deaths are the testimony of one of the greatest gifts of Christianity to peacebuilding: keeping the very possibility of hope, life, and peace alive in times of violent persecution' (Bartoli, 2004, p. 149).

Elizabeth Johnson, in *Friends of God and Prophets*, speaks of what she calls paradigmatic saints, those persons whose story and witness stand as 'an act of resistance, as a call to action, as a spur to fidelity.' In the telling and reliving of the particulars and the power of these lives, she reminds us, 'the community itself catches the vision of a world made whole and becomes itself, a little more, an advocate for peaceable community throughout the earth, a counterforce against violence and domination' (1998, pp. 236, 239).

Recognition of the educative power of the exemplar is woven into the curriculum for peace and justice developed over the years by Christian religious educators James and Kathy McGinnis. Four integrated components for peace education are found in all of their programs geared to a religious education setting: access to the story of Jesus; access to the story of inspired lives who have staked a claim for peace; access to the story of victims of oppression and injustice; and community action planning. For example, one of their lesson plans for early adolescents—'Today's Peacemakers'—concretises the meaning of peace and peacemaking by presenting 'living examples of peacemakers so that peacemaking becomes a real option for students, at present as well as some time in the future, and to inspire students to choose that option.' Individual and small group projects, case studies, videos, and reading lists are furnished on the life and witness on such peacemakers as Gandhi, Martin Luther King, Cesar Chavez, Daniel and Philip Berrigan, Dom Helder Camara, Jean Donovan, and Franz Jagerstatter. Dorothy Day and Mother Teresa are included as well (McGinnis, 1986). *Facing History and Ourselves; The Jews of Poland* (1998) is another excellent resource for educators working with adolescents. Using autobiography, diaries, official documents, and literary works, the multi-faceted curriculum stimulates students to think about the complexities of good and evil, the consequences of choices, and the responsibilities of citizenship.

One final conversation partner for religious educators may be found in the intersection of the concerns and values of feminism and the work for peace. In her challenge to the Church to make a commitment to the promulgation of positive peace through development of a biblical theology of peace and research into the history of peace, theologian Mary Evelyn Jegen sees the women's movement as a welcome partner. 'The intersection of the women's and peace movements can bring into focus ways of communication, of organization of power, of ways of dealing with conflict, of structures of mutuality that offer needed alternatives to structures of domination and subordination,' she says (1991, p. 300). Feminism rejects the power principle of domination and subjugation and celebrates relational and empathetic values. Sensitive to the social and historical contexts for moral decision-making, feminism shows special concern for the virtue of compassion and for those who suffer. Both feminists and peace advocates share a commitment to the virtues of peace in the global community, to the dignity and interdependence of all peoples, to solidarity with those on the underside of history, and to the use of power for collaboration, not domination.

One theologian who has also explored the explicit links between the concerns of feminism and peace is Rosemary Radford Ruether. 'Feminism,' writes Ruether,

fundamentally rejects the power principle of domination and subjugation. It rejects the concept of power which says that one side's victory must be the other side's defeat. Feminism must question social structures based on this principle at every level, from the competition of men and women in personal relationships to the competition of the nations of the globe...Nobody wins unless all win. Warmaking has reached such a level of destructiveness that the defeat of one side means the defeat of all, the destruction of the Earth itself. Feminism today sees its links with the cause of human survival and the survival of the planet itself (1985, pp. 72-73).

She goes on to unveil in feminism the very embrace of nonviolence, seeing in it the 'courageous resistance to violence and injustice which reaches out to affirm rather than to negate the humanity of the other person'—an alternative vision of the authentic self and life in community once provided by 'radical Christianity' that transcends, as she describes it, the aggressive dehumanization of others or timid acquiescence to the violence of others. Moral theologian Lisa Sowle Cahill reinforces the linkage when she too affirms 'affinity with pacifist values' in the relational and empathetic values of feminism and its identification with those who are 'history's victims' on the underside of power (1993). Cahill adds an important caveat to her assessment. Most feminists, she says, 'would be cautious about crediting women with a higher morality than men as if women would be able to avoid conflict were they to attain comparable positions of political power'. African theologian Mercy Amba Oduyoye has forcefully argued for the recognition of links among peace, justice, and the experience of women, writing that disparities in wealth, power, and responsibility have often resulted in the feminization of poverty and the multiple oppression of African women. 'Fear and the machine

gun will not bring about a new society; only a qualitative change of heart towards justice and love will give us peace' (Oduyoye, 2004, p. 41). Women are essential partners in the embodiment of a holistic approach to justice, peace, and ecological harmony.

On the international level, feminist and women's groups have long been involved in peace work, and their commitment to conflict resolution, anti-militarism, and advocacy for human rights and development has expanded the definition and agenda for peace beyond 'non-war.' Transnational feminist networks such as the Women's International League for Peace and Freedom, Women Strike for Peace, and Women in Black show the power of collaboration in challenging traditional political and gender orders and working for structural and societal reforms (Moghadam, 2001). A benchmark work by Brigit Brock-Utne (1989) expands the agenda further. She argues that only as rigid socialisation into traditional sex roles of masculinity and femininity are examined and reframed can peace in families and communities be achieved.

Toward the Peaceable Kingdom

The power of religion to inspire or restrain violence is what R. Scott Appleby has described as the 'ambivalence of the sacred'—the dual capacities within religious impulses to promote with 'militant vigor' both the welfare of the other and to work against the other (Appleby, 2000). These same themes are explored in Steffen (2003). 'Religion can motivate and sanction violence, having the power sufficient to legitimate harmful acts in a realm of ultimate meaning and through ultimate authority,' he writes. 'In that it possess power to do these things, religion is dangerous' (p. 37). Religion has the capacity and sad history of promoting hatred and intolerance, as well as the promise to live with, explore, honor, and even celebrate difference. Religion can serve as a license for violence. It can also be a source of the courage to confront and diffuse violence. 'It is the obligation of scholars and educators to discriminate between the zeal that compels true believers to violate the rights of others, and the zeal that compels them to defend those rights at any cost' (Little & Appleby, 2004, p. 2).

One response will be a religious education beyond denominational formation that would engage with what theologian David Hollenbach describes as a theology of globalization – a spirit of internationalism expressed in a web of political, economic, social-cultural, and environmental interdependence that 'grants membership in the human community a higher value than citizenship in a particular nation state'—or any one religious tradition, one might add. Max Stackhouse, moral theologian at Princeton University, has written extensively on this same theme. The move toward a cultural, economic, and political global synthesis made possible by advances in science and information technology 'is always nested in moral and religiously held perspectives...subject to ethical and theological analysis,' he argues (Stackhouse and Obenchain, 2000, p. 6). Removing religion as one source of division within the

human community is the horizon toward which religious educators might move, pray, and have their being.

No matter the latest painful example of a failure to live out the Peaceable Kingdom brought to us on the nightly news, or the ‘not yet’ in the outcomes assessment of a curriculum dedicated to an embrace of theological diplomacy. Religious educators can still claim with integrity the potency of religious communities themselves as models of reconciliation and the power of personal friendships formed with people of other religions. As James Heft reminds, ‘When there is friendship, there is respect and the desire to be even-handed when criticisms and plaudits are offered’ (2004, p. 13). No matter the status of the deep yearnings for peace that seem so illusive in our day. The possibilities for the rich synapses of friendship, peace, dialogue, and truth can still be aborning in the personal experience of religious educators. They can be a source of the discernment, creativity, energy, and passion required for the work of remaking our shattered world. Naming and claiming our own experience in universally shared characteristics of our common humanity—our identity as Beloved, our joys and sorrows, destitute dreams and embodied hopes—these too can be part of the religious educator’s curriculum for peace. It is a noble work and calling.

EDUCATING THE MULTICULTURAL ADULT LATINO COMMUNITY: AN AUGMENTATIVE PEDAGOGY FOR RELIGIOUS EDUCATORS

Dr. Jorge Diez

Executive Director, Hablemos de Cristo, Inc.

Introduction

Education is not a single discipline but, rather, a field of study in which various forms of disciplined inquiry interrelate. Since education is a field of inquiries with established purposes, methodologies, principles, and philosophies, then, religious education, as a field of inquiry, requires an amalgamation of several educational theories for fashioning appropriate educational approaches to meet desired goals and objectives. Educational theory is useful for laying down different teaching designs in relation to the educational environment in which religious education takes place. Theory assists in channeling what is considered essential for the content of religious education such as identifying the appropriate process for recognising objectives and relationships that should exist between scope and process. Theory has the power to bridge the gap between research foundations and the field of practice.

In this essay, the integration of several educational theories designed for a specific purpose is addressed as an ‘augmentative pedagogy.’ The principal theoretical objective of this augmentative pedagogical religious educational approach is to transcend the limits placed by theory for defining its utopian philosophy. An augmentative pedagogical approach adapts different theoretical principles in a way that can be translated into practical opportunities. Therefore, an augmentative approach to education must break barriers and dissolve the rigidity among philosophical theories to construct bridges of interaction. It must soften theoretical boundaries to create educational environments of implementation. This approach to education endures and widens the dialogue between theory and practice. Fenstermacher and Soltis (2004) state that, ‘what appears to

be mutually exclusive or inconsistent in theory is not always that way in practice' (p. 73).

One of the goals of using an augmentative pedagogical approach to religious education must be to supplement and harmonise the general goals of religious education. In a multicultural setting, therefore, an augmentative pedagogy is a complement to education that contributes to the bonding and strengthening of religious education programs to properly serve the needs of diverse communities. Thus, the goals of an augmentative religious education must go hand-in-hand with the general goals of religious education. For instance, in fashioning a religious education program for peace and justice, theories of education, sociology, and history should be placed into dialogue to more suitably approach the theme. In designing religious education programs for children, an augmentative pedagogy, besides theories of education, can be used to integrate theories of child-development, family education, classroom teaching, and so on. In other words, an augmentative pedagogy is an education specifically designed for particular situations. Therefore, in teaching an adult multicultural Latino community, it is proposed that theories of inculturation, multicultural and adult education are principal foundations for fashioning practical religious education designs to offer different perspectives to religiously educate diverse adult communities.

The impetus to use an augmentative approach that integrates inculturation and multicultural religious education in diverse adult Latino communities is to evade the possibility of producing an intense ethnocentrism that promotes separatism and segregation. This type of augmentative approach to education integrates and invites all ethnicities to genuinely be part of the whole, to be one in diversity. Members of the community must be willing to learn and share from their own heritage and be ready to participate in the learning experience of the larger religious community. Multiethnic and multicultural churches will do well by helping members observe how they fit and function within both their own microculture and the larger society. One task facing Christian religious education is to balance the tension between the traditional culture and the dominant culture in a way that frees members to live Christianly in both cultures. An augmentative pedagogy promotes a sensitive consciousness between the relationship of the faithful experience and the religious experience of the institutional church. This type of approach facilitates the interdisciplinary and intercultural conversation that welcomes those who have remained as outsiders.

Elias (1982) claims that the development of educational planning moves from values to needs, and from interests to objectives or purposes. All teaching design theories embrace a treatment of objectives, though the term is used in different ways. He maintains that religious education objectives should neither be stated nor pursued to ensure that people do exactly what is proposed. Instead, he insists that the development of objectives aimed at adult religious education must be a cooperative resolve. Since objectives can be accomplished through many different courses of action, educators are faced with the arduous task of finding, establishing, creating or fashioning suitable designs. However, in order to facilitate educators in designing

an augmentative pedagogy that religiously educates the multicultural adult Latino community, educators must keep three important determinants in mind: fostering diversity, building community, and enhancing personal growth.

Fostering Diversity: A Process of Inculturation

Inculturation is a response to God's call in local languages and symbols, with diverse faces and colors dancing with joy at the native beat of people's hearts. People migrate to a 'new land' with their own cultural identity as they were created and formed. Latinos, for example, cross the borders with timeless treasured religious traditions and popular practices of expressing their vivid faith. Inculturation acknowledges the uniqueness of the people embedded in the creation of God; a creation that is multi-rich and offers infinite possibilities and complexities to be in union with God. Inculturation unites the body, soul and nature with God. 'Inculturation is the on-going dialogue between faith and culture or cultures' (Shorter, 1997, p. 11). Inculturation educates the community and develops the capacity to relate in the intermingled world of the sacred texts and culture. Through an inculturated process, the religious experience enriches itself, and upon entering a new cultural stance, it acquires an abundance of meanings and interpretations that are conjugated in the amalgamation of life experiences and in the Word of God. The Word of God is 'caught', rather than 'taught', through the witness of human beings who live its values culturally.

Joe Holland and Peter Henriot (1980) indicate that, 'culture is the medium through which the spiritual visions and energies of a society are expressed' (p. 90). To deepen the knowledge of a culture it is necessary to observe, listen, and learn from the reality of people. By knowing their socioeconomic, psychological and spiritual needs, a friendly dialogue can be established. Sometimes cultures can be extremely repellent to outsiders, while to others they can be more convivial; nevertheless, for a beneficial religious transformation, and interaction between the culture and religion, a mutual dialogue is required. Inculturation helps bring forth a 'new creation' where 'religion and culture are capable of transforming one another' (Shorter, 1997, p. 31). Inculturation can serve as an integrating medium that unites cultures with the divine, the divine and the human in one essence. Inculturation invites and welcomes diversity. It offers hospitality, thus promotes openness and servitude to better the world. Inculturation is a unifying instrument that is essential for the life of Latino communities. It functions in the midst of diversity and is a response to a call for change.

Inculturation: A Human Learning Experience

For Christians, inculturation promotes a dynamic dialogue and relationship between the church and the variety of cultures: a profound insertion of the Gospel and faith into the cultures, an ongoing process of reciprocal and critical interaction and mutual

integration. Inculturation pays close attention to human experience, and experience brings out the innermost feelings, emotions or impressions of the individual that are apprehended through personal acquaintances. By experiencing and celebrating the Gospel, the community learns and is transformed. An inculturated church aids the community in experiencing a living Jesus, a Jesus that walks in the twenty-first century, sharing and hearing experiences as he did during the road to Emmaus. During the process of inculturation, the symbolic meaning of the Christian faith may be developed, transformed or renewed, but the substance, essence, and centrality remain the same: Jesus. A faith that does not become culture is a faith that has not been fully received, thoroughly thought through, nor fully lived out (Lane, 1992).

Building Community: Multicultural Religious Education

A welcoming multicultural environment goes beyond a mere attitude of tolerance. It must include respect, understanding, forgiveness, and acceptance. In an increasingly pluralistic and multicultural society, religious institutions must speak from weakness rather than from power. A diverse community must explore the various pedagogical proposals that recognise and accommodate the needs of diverse learners by discovering reasonable 'strategies that support commitment to a preferential option for the vulnerable, economically disadvantaged, and socially excluded communities of learners' (Cruz, 2001, p. 56).

A Call for Social Justice

A multicultural religious education approach stirs and awakens intrinsic aspects of individuals and cultures necessary for a healthy mingling. By providing multicultural environments, people are exposed to different ways of thinking and behaving, offering significant insights into new ways of being. For instance, Sonia Nieto (1992) stresses that multicultural education calls for a 'critical and liberating education,' while Allen Moore (1982) adds that religious education must be redressed 'to become prophetic, challenging oppressive social structures and recovering its historic relationship to Christian social action' (p. 103). Thus, religious education must be a vehicle of protest and challenge in the struggle to revamp the existing social and economic inequities. Religious education has the 'responsibility to name social evil and to participate actively in the radical reconstruction of the social order' (Moore, 1989, p. 12). As Elias suggests, 'as education for social justice and peace becomes a more important dimension of adult religious education, theories of adult learning that emphasise the close connection of reflection and action will become more prominent' (p. 114). Therefore, the presupposition of all social systems have to be challenged, social and public organizations should be promoted to increase individual choices, and human resources should be allocated in a way that is proportionate to need. Christians are obligated to seek justice and peace in the world, just as all persons who strive to live and authenticate religious

values should, whenever possible, join all persons of good will in the effort to solve social problems in ways that consistently reflect Gospel values.

A Relationship of Reciprocity

Multicultural religious education should be regarded as a relationship of reciprocity in that all participants should be involved in the teaching-learning process. For instance, the hierarchical method of the authoritative teacher and the dependent learner is not adequate because instead of engaging in the experience of learning, students become the recipients of information. Thus knowledge is transferred but not created (Freire, 1970). In multicultural settings, the learner must be considered as a transformative partner who is fully involved in the teaching-learning experience. An education that brings diversity together strives to dissolve the rigid distinctions between teacher and learner by impressing on the community a strong sense of equality, respect, and mutuality. There must be a link between teacher, content, procedure, and learner, and it must be based on the experience of both the learner and the teacher, not only on a culture imposed on the learner. Therefore, the learner must have a substantial input in the elaboration of curricula.

A Source of Integration

Multiculturalism needs an adequate theory of culture that can conceivably be generated through comparative analysis and dialectical conversation:

It is not just a matter of socialising, belonging, communicating, and interacting; it is a matter of social responsibilities, of loyalties and solidarities, of deep commitment to the other human beings, to groups, and to society within the bonds of freedom and dignity (Jenkins and Kratt, 1997, p. 72).

Aspects of culture strongly grasp distinctive values and ways of viewing reality. Since religious values supply the basic social cohesion that makes a society righteous and enduring, then, one of the functions of multicultural religious education is to ascertain that the multiplicity of values found in diversity are integrated into the whole spectrum of religion. In this sense, a multicultural religious education is an emancipating or liberating experience. Multicultural religious education welcomes diversity but also challenges it. During this comparative and dialectical process the community begins to grow and transform itself by becoming a stronger community instead of a victim of circumstances. An innovative religious educational pattern must convey 'a sense of the *interplay* of cultural visions, values, and practices: participants experience a genuine cultural mutuality and come to be characterised by it' (Foster, 1987, p. 95). The interaction between two or more cultures must reciprocate in nature and must be integrational.

A Symbiotic Praxis

All cultures must be both givers and receivers. This is also true of the contact between church and culture. Their contact must be mutually beneficial, otherwise, it may prompt people to seek a different religious community, philosophy or religion, to fill that void. Differences of opinion are healthy symptoms in a multicultural environment. It is a natural reaction to reject those who do not please us. It is imperative, however, that a mutual dialogue, a conversation among diverse groups, be established in order to bring forth the richness of the 'other.' Multiculturalism seeks a resolution in which each culture respectfully 'visits the preconstructed constraints and genius of the other's way of seeing the world, and each transforms its attitude about the possibility of solutions that preserve the integrity of both' (Kegan, 1994, p. 318). Multicultural religious education rejects a purely assimilationist approach; on the contrary, it recognises the importance of diversity, the interactions with people, recognition of cultural identity, a reflective action, and the increasing awareness of multiculturalism. It fosters community in innovative ways, such as 'unity in diversity,' that transform relationships and understandings, particularly since learning values is much more than developing educational programs.

Equality Among Diversity

Just as a multicultural approach to education exalts the particularities of each ethnicity and history as equals among diversity, a multicultural congregation requires an authentic incorporation, communication and collaboration by discerning and integrating differences that provide healthy environments amidst tensions. Such a multicultural religious education respects the interplay of cultural experiences and allows people to claim their own identities and respond to the identities of others. Furthermore, religious education must be holistic, joining together cognitive, affective, and everyday life learning. Only in this way can religious education be truly religious. Multicultural religious education requires that the learner not only know about other cultures, but also have positive and loving attitudes toward those cultures and their members. Learners need to capture in their own lifestyle significant human and religious values derived from other cultures (Lee, 1971). For Christian religious educators, for example, an important task is to first 'focus attention on how better to combine knowledge, affect, and action in ministry, and second, how to more adequately educate Christians for ethical responses to the crucial issues of diversity' (Jenkins and Kratt, 1997, p. 67). A balanced equality begins with first recognising the 'other.'

A Teacher/Learner Transformation

Multicultural education must respond to the needs, interests, capabilities, goals and histories of the learner. The learner should be at some centre of the instructional activity. The teacher strongly contributes to shaping the conditions of the educational

environment, providing a personal, living encounter between the learner and God. The teacher is mostly responsible for nurturing a developmental process of relationships, contributing to the fashioning of the multicultural educational environment. Multicultural religious education must be *proactive* and *engaged*. Its content, objectives, and methodologies, must engage people in actively shaping their present and future conditions rather than passively responding to the subtle dogmas of the past. Multiculturalism must respect, celebrate, and nurture diversity.

The Multicultural Educational Environment

It is in creating adequate educational environments that a community may learn about its diversity and find its collective, transformative, and evolving identity. 'When individuals realise that there are alternative ways of thinking and interacting, they see that their own culture is not intrinsically superior, nor are others necessarily inferior' (p. 59). The educational environment must be fashioned by forming nets of experiences that contribute to the construction of communal surroundings, to living life fully and abundantly, and to finding joy in being creative. The educational environment utilises creativity in exercising the gifts and charismas that allow people to experience both failures and successes. The educational environment fosters free will to expand and magnify the lives of people, and the educational habitat enriches and transforms itself in a way that is fertile, welcoming and appropriate. Each individual, each culture, has a unique richness to contribute to the development and understanding of our surroundings. They each have their own gifts to offer. To overcome a tarnished mode of tolerance, it is necessary to experience acknowledgement, recognition, intensive interaction, connectedness, belonging, celebrating, listening, forgiving, acceptance, responsible engagement, integration, and committed stewardship. 'Christians from various cultures, learning from each other, can help bring Christian faith to a fullness that its immersion in a particular culture is unable to achieve' (Wilkerson, 1997, p. 4).

Enhancing Personal Growth: The Adult Learner

The Meaning of 'To Teach'

In approaching an educational method for a multicultural Latino community, it is most advantageous to explore the meaning behind 'to teach.' Questions that aid in clarifying this meaning must be raised, such as: Is teaching a solely normative activity? Can teaching be considered within the scope of formal and informal education? Is schooling the only form of teaching? Are teaching and learning two separate activities? Should religious education consider utilising other 'life-forms'—family, work, leisure—other than schooling? Is religious education a lifelong affair?

Maria Harris (1989) suggests that, 'what is needed is a way of understanding, and speaking about education, which, while taking children and schooling seriously, refuses to collapse the meaning of education into the work of children that is done

in school' (p. 40). Educating is a process of teaching-learning that involves the whole spectrum of society. Moran (1989) proposes that 'any effective teaching of a religious way of life requires a range of settings for teaching: family, in the religious congregation, in the struggles for justice, in the contemplative silence, as well as in the classroom' (p. 3). Consequently, adult education belongs to the main field of education, and should not be treated as a separate or discrete subject of education. Many religious educators are favoring a lifelong religious educational journey that engages the community in diverse and pluralistic dialogues, finding order in chaotic situations and creating inclusive environments that are sensitive to culture, age and gender, and are further responsive to the experiences, needs and interests of the community. The walk across the threshold of a multicultural environment exposes peoples' thoughts, ideas, traditions, values, and the like, to public scrutiny.

Education 'is a work especially concerned with the creation, re-creation, fashioning, and refashioning of form' (Harris, 1989, p. 40). Form is the actual shape of content. If education is form-giving, then a goal of education is to approach the current reality by capturing and analysing lived experiences, fashioning and refashioning them into a form that is comprehensible and transformative for both the teacher and the student. The teacher and student are re-shaped during an educational encounter.

The field of education must be composed of many languages or forms of expression that evoke dialectical interactions. Religious education must provide adequate environments where the human race can comfortably converse and nurture opportunities for dialogue, thus, aiding in the conceptualization of discrete information. A good teacher teaches by optimising both apprenticeship and coaching methods. Teaching is to 'show' the 'how' of the complex life. One way of showing the how of living is by design. To teach by design refers to a design or designs that teachers utilise. During the process of showing how, the teacher analyses an already existing design and proposes a redesign. Consequently, the intention of to teach somebody something unavoidably attempts to inflict some kind of design. In other words, in the act of to teach, a teacher discovers that every human design is a redesign. Therefore, 'the best that a teacher can do is work with student and environment to improve the present design' (Moran, 1997, p. 59). The most efficient teacher is not the one who begins by laying down examples, but the one who is an example.

Three Prominent Teaching Styles

Learning styles can be thought of as descriptions of individual learning personalities. 'A learning style is the consistent pattern of behavior and performance by which an individual approaches educational experiences. It is deeply embedded in the personality and reflects how a person views the world' (Bainer and Peck, 1997, p. 295). How teachers view their role and goals as teachers has a great impact on how they structure their teaching. Furthermore, the approach teachers take to their teaching has a great effect on what they do as teachers.

Three basic concepts or approaches to teaching that have been very influential and are currently used by most educators in the United States, are the executive approach, the facilitator approach, and the liberationist approach. These three perspectives have consciously or unconsciously aided educators in their ever-challenging educational tasks. The executive style observes the teacher as an executor, a manager of a complex classroom, 'a person charged with bringing about certain outcomes with students through using the best skills and techniques available' (Fenstermacher and Soltis, 2004, p. 5). The facilitator style places substantial emphasis on incorporating the student's prior experience into the learning activity. This approach views the teacher as an empathetic person charged with helping individuals personally grow, to reach a high level of self-actualization, understanding and acceptance. It concentrates on developing authentic individuals through personal and meaningful educational experiences. The liberationist style considers the teacher to be a developer of minds, a liberator, and sometimes an emancipator, 'one who frees and opens the mind of the learner, initiating him or her into human ways of knowing and assisting the learner in becoming a well-rounded, knowledgeable, rational, and moral human being' (p. 5). These three teaching styles are derived from different philosophical principles. In theory, according to Fenstermacher and Soltis, it would be impossible to combine these styles; however, in practice, elements of each style can be utilised to fashion a more relevant educational style.

A Culturally Conscious Education

A culturally conscious religious education must promote rather than restrain minority learners' success and spiritual development. Bainer and Peck (1997) indicate that minority groups should not be observed as victims of inescapable situations who are less capable of difficult learning, or are crude and less sophisticated than other learners. They suggest that educators be confident in minority learners, and insist that they are capable of overcoming obstacles by providing them with challenging ideas and tasks. According to them, education must respect the incredible task that minority learners engage in when coping with two cultures. The culturally conscious religious educator must utilise instructional skills that are effective with minority groups. What traditionally might have been considered sound teaching in a majority cultural situation may not necessarily be an effective teaching technique in a multicultural setting. All learners must be exposed and must benefit from the educational endeavour.

Designing Parameters for Multicultural Adult Religious Education

An effective educational design corresponds to the merging of a carefully developed theory and a successful practice. Any approach to education cannot exist isolated from its environment. Since the educational components of inculturation, multicultural and adult religious education cannot be separated from the broader

field that it serves, individuals seeking religious knowledge or growth can find excellent learning opportunities in the context of a religious tradition or within a faith community. In preparing educational programs for Latinos, some important elements, or design parameters, must be seriously considered.

1. The learner's personal experience must play an important role in designing adult religious education programs. Adults filter new information, experiences, and feelings through the memory bank of their prior experiences. People are better prepared to learn something when they experience a need to learn it. It is impossible to separate adults from the wealth of experience they bring to the learning situation. Since adults bring prior experiences to the learning situation, recalling and examining them will aid in determining the right course of action to attain success in the new learning experience. Adult learning is not expected to take place without the integral component of the participants' reflection on their own experiences. Through the sharing of experiences, participants hear each other's stories, make connections with their own lives, and reorganise the knowledge generated in the exchange.
2. Flexibility in redesigning programs must always be reiterated. The educator's role requires flexibility and openness to an educational design that transcends well beyond the role granted by the traditional teaching design. Flexibility aids in accommodating the educational environment, and promoting inclusiveness.
3. The teacher must be a co-learner in the teaching-learning environment. The major strength of a teaching design is its ability to provide an organizational structure in which both the teacher and learner can plan their activities.
4. Integrating needs, interests, and values are solid foundations for a healthy multicultural educational environment. A pillar-based educational structure is the amalgamation of people's needs and interests in the teaching-learning activity. Both teachers and learners must be clear on the details of the process. Hence, both teacher and learner become co-artists in shaping the educational design. Educators must be aware of their own values and the values they wish to promote through education without forgetting the richness of the 'other,' and by addressing broader social issues, educators can gain perspectives and insights into how to meet needs at more personal levels.
5. It is crucial to pay attention to the learner's satisfaction. The very nature of adult education requires paying close attention to the satisfaction and value that the learner places upon his or her individual learning experience and whatever is learned during the experience. Furthermore, satisfaction is a good point of reference for evaluation in which planning, teaching, administration and facilitation may be assessed. It must be kept in mind that effective teaching designs are derived from the integration of sound theory and thoughtful practice that are closely connected to the environment as well as to its foundational roots.
6. Educators need to be aware of the traditions and social environments of each particular group in which they serve. For example, the local organism of

a parish or congregation breathes life from the local needs of the community. An adult religious education model that merely presents official teachings, and blocks the freedom to explore and study the individual and communal experiences of its people, cannot hope to meet the needs of those who desire greater participation, freedom, and plurality in their religious experience.

7. The uniqueness of each group present in the educational environment contributes to the fashioning of strong foundations. Considering the plurality and multiculturalism of societies where hostility, insensitivity, oppression, and segregation may exist, adult religious education must exercise a prophetic attitude to balance all aspects that make the 'other' 'inferior.' Elias (1982) insists that, 'The more the incongruence between the individual and the environment, the less is the possibility that the person will be involved in adult education' (p. 98). A connection, therefore, must exist between each particular group, the individual and the learning environment.
8. The fostering of interinstitutional relationships is vital. The whole community must be involved in religiously educating the community. This implies that institutions other than the church must be integrated as part of the religious educational environment.
9. The encouragement of active participation consolidates religious education. Participatory action solidifies 'the coming together,' and makes it more meaningful. As Beverly Cassara (1987) states, 'Participation is an important adult education idea – a powerful democratic idea that enables social groups, deprived of education and economic and political advantages, to gain some mastery over their own development' (p. 1).
10. The awareness of social concern is imperative for obtaining a better understanding of the educational environment. Christian religious education cannot be isolated from social concerns. Religion, by nature, is social. Therefore, the content of religious education must integrate components of community and social action. The religious learning process begins with where people are. Through praxis, the individual develops an awareness that triggers critical thinking for social transformation.

Therefore, to be truly effective, adult religious education, multicultural education, and inculturation must be sensitive to the whole social context within the environment in which education takes place. Religious education programs need to focus on concerns that interest all members of society. Religious education must be made visible and available to the entire community. All members of the community must be offered the opportunity to learn and understand Christian faith.

Inculturated Christian Religious Education

For Christians, inculturation is a mutual adoption of Christ and culture, an integration that renews entire aspects of humanity through the paschal mystery. The Gospel must drape itself with cultural flesh, just as the Son of God suited himself

in human flesh to conjugate God's Word. The reciprocal adoption conforms to the Christian family, and the Church is transformed and guided by the active divine seed, planted so as to flourish in the fertile land of culture. Inculturation is not simply about the imposition or adaptation of the Gospel to local situations. Inculturation goes beyond a relaxed position where it simply coexists with faith and cultures. The process of becoming inculturated involves the praxis of the whole community. It is a unifying effort of inclusiveness, hospitality, welcoming, accepting, empowering, delegating, loving, caring, to name a few. This new emphasis emanates from the depths of the culture's soul and the seed of the Gospel that gives birth to an unprecedented beauty.

The inculturation of the church is the integration of the Christian experience that not only expresses itself 'through elements proper to the culture (this alone would be no more than a superficial adaptation) but becomes a principle that animates, directs and unifies the culture, transforming it and remaking it so as to bring about a new creation' (Arrupe, 1981, p. 173). An inculturated religious education approach aids religious institutions in developing an interest in the other, a sense of openness, more cross-cultural skills, and a willingness to include the other while avoiding an education that is exclusively Euro-centric.

An Inculturated Multicultural Education

The field of multicultural education approaches religious education by considering people's present situations and by helping each different group or culture to retain its identity. 'The Gospel of Christ does not exist in some kind of *a priori* pure state or a historical pristine condition, waiting to be applied' (Lane, 1992, p. 9). On the contrary, the Gospel has evolved through the centuries among diverse people, taking on different forms, responses, and inculturated effects. Shorter (1997) highlights that, 'The death and resurrection of a culture under the influence of the Spirit of Christ cannot be definitive until the end of history. The dialogue between culture and the Risen Christ is an on-going process' (p. 85). 'Every act of inculturating Christian faith must involve a dying and rising, a dying to the old cultural forms so that the substance of the faith may reappear in the new cultural form' (Lane, 1992, p. 19).

When learners relate to the context of their own situation, all the meanings and practices introduced by the religious educator will provide new perspectives for the educator. For the multicultural community, ethnic identity issues are of extreme importance. So, 'As a part of the Christ's community, individuals are accepted fully and are freed to be their own, full selves. Thus their personal identity is authenticated and accepted' (Wilkerson, 1997, p. 45). 'If the church is to be faithful it must be formed and ordered from the inside of its experience and confession and not by borrowing from sources external to its own' (Brueggemann, 1978, p. 15); otherwise, there could be serious consequences. For example, African-American and Mexican-American Catholics are leaving the Catholic Church by the thousands due to the lack of a proper inculturation process. 'These rich heritages of faith

cannot be truly expressed through the formal and rigid forms of worship shaped by Roman-European rites' (Rademacher, 1996, p. 236). A multicultural education is challenged to deliberately build theoretical perspectives and contexts found in the expressions weaved by interdisciplinary dialogue.

Inculturation conveys that personal conversion and social transformation are feasible for all. Therefore, inculturation safeguards cultures. It challenges and purifies cultures rather than destroying and condemning them. Inculturation converges cultures into a communal centre mitigating the discrepancy between the mainstream culture and the outsiders from within: the immigrant, the vulnerable, the minority groups, such as Latinos, and so on. Inculturation closes the gap that Latino immigrants experience when simultaneously living in two different cultures. Inculturation aids Latinos in remaining *in both* rather than *in between* two worlds. 'Just as the Gospel can cast new light on each human situation, those situations in turn can bring different dimensions of the gospel into new life' (Gallagher, 1998, p. 105).

An inculturated multicultural religious education includes a sharing of values, a common bond that holds diversity together. Inculturation provides a base, a root, an important foundation from which plurality and diversity emanate. Pluralism does not necessarily mean relativism. A pluralism that is engaged in dialogue and correlation with faith is far more realistic. It is a pluralism seeking a centre of unity. Without some centre of unity, pluralism will lead to chaos (Lane, 1992, p. 14, 15). Since diverse and pluralistic societies embrace multiple experiences, interests, needs and ideals, a web-matrix of these diverse elements is created through a mutual exchange that contributes to the shaping of the multicultural ethos. An inculturated multicultural religious education fortifies communities with powerful voices.

Augmentative Pedagogy: Religiously Educating Adult Latinos in Diverse Environments

Integrating the field of inculturation, while religiously educating adult multicultural communities, creates environments of equitable relationships among all society groups and aids in the abolition of segregation. An inculturated adult multicultural religious education is a source of participatory transformation, collaboration in unification, and an empowerment and liberation that celebrates a community of communion.

In a multicultural context, religious education must be vigilant to the difficulties and sufferings that weigh heavily on minorities, recognising and addressing the insufficient and disproportionate means of self-development, the lack of respect for the basic rights of freedom, and all those aspects that foreclose the transmission of spiritual responsibilities from individual to family and society. In this regard, inculturation, multicultural and adult education are instrumental mechanisms that induce praxis, create educational environments in which cultures can interact in reflective action, and bring out the beauty of each culture by creating a common faith that is meaningful to the whole community; a unifying centre. Thus, a Christian religious education method that includes inculturation, multiculturalism, and adult

education, recognises the narratives of the learners and interprets them in the light of the Christian message. It retrieves the memories of their cultural and indigenous religiosity to enable the outsiders to be full participants in the building of connectedness.

One single educational approach can never do justice to diversity. Imposing a monocultural educational approach erects a barrier, between learners and educators, which forecloses healthy religious and spiritual growth of the community. An augmentative pedagogy diminishes the tendency to evaluate the 'other' solely through dominant cultural lenses. It fosters a sense of interplay and partnership among diverse cultures by enduring genuine cultural mutuality. It respects, celebrates, and nurtures diversity to promote a healthy identity of ethnic heritage. This is a process of inculturation, a process of mutual transformation, a process that nurtures a continuous engagement of open and cordial dialogues among plurality and diversity. Religious education must adjust its programs to reflect the multicultural reality of its community, and articulate models that enable different people to live together in a context of mutual respect and care. This also applies to the Latino community which itself is multicultural.

Adult Latino learners should not be treated as recipients of knowledge; on the contrary, they must be recognised and accepted as co-benefactors in the sharing of knowledge. An augmentative pedagogical approach induces learners to actively participate and be proactively engaged in the teaching-learning endeavor. It is crucial to identify the learners' experiences as part of the learning activity to aid in the development and enlightenment of the religious interpretation of their own reality. An augmentative religious approach designed for adult learners assists them in understanding their faith in light of their personal and communal experiences, and provides appropriate environments to respond to God's call in creative ways. The active adult learner, in this approach to education, develops the capacity, skill, and ability for spiritual discernment. This pedagogy aims to bring adults to a complete and full maturity in their knowledge of their religious tradition.

A well-established multicultural ethos, based on the encounter between religion and cultures, searches for a common ground, encourages participatory actions, addresses diverging and dissenting issues, discerns the beauty of symbiotic relationships, embraces differences with empathy, and brings about a systemic change of mutual action. The multicultural environment provides an ethos for dialogical, collaborative and mutual transformation. Cultures have the tendency to encapsulate themselves, yet a well-organised religious educational environment aids learners in breaking out of these encapsulations to develop more openness for the other.

An augmentative religious pedagogy seeks to build adult communities with clear faith identities. A critical consciousness and a praxis response illuminate new avenues for building community. An inculturated multicultural adult religious education includes the personal, interpersonal, social, and political to free people from a distorted and oppressed reality that binds and prevents them from realising who they are.

Augmentative Pedagogy: A Mutual Transformative Experience

'Human beings do not invent themselves in a vacuum, and society cannot be made unless people create it together' (Shor, 1992, p. 15). And, 'just as society teaches individuals, individuals learn to improve the society through education... Society is composed by the interaction of persons' (George Coe, 1917, p. 13). In the relationship between majorities and minorities, attention must be placed on each individual as important assets in the building up of a multicultural ethos. This relationship impels minorities, in this case Latinos, to retrieve their subjugated narratives, relive their subversive memories, and codify their stories as part of a legitimate social and religious history (Cruz, 2001). An augmentative pedagogical approach, designed to integrate minorities, liberates learners' minds from the unconscious control of oppressive ideas that persistently blur their vision and deter their pursuit of true freedom. Ideas that marginalise, imprison, and incapacitate the ability to think and act, socially injure individuals by depriving them of better opportunities in life. Therefore, an augmentative pedagogy transcends limits and makes an effort to overcome the social image of a world in constant strife and oppression, where those who have power, privilege, and status, assert themselves, yet those who perceive themselves as lesser persons, accept their powerless fate.

Recognising plurality and diversity as a resource, and not as a liability, creates a healthy climate that facilitates the addressing and solving of problems, offering the opportunity for people to be heard in all decisions that affect them (R. Likert & J. Likert, 1976). A vigorous, interpersonal environment is essential for promoting religious learning in diverse communities. An augmentative pedagogy designer must find the means to act as a mediator between newly arriving cultures, and those already present, to create stances of belonging and inclusiveness. Therefore, it is not only in the macro-universal approach of being church, but also in the micro-apostolic ministry that the church can effectively serve a multicultural world.

An augmentative pedagogical approach overcomes the disguised social reality and transforms it with qualities of active freedom and human responsibility. Dominant cultural views cannot be fully accepted without critical reflection because, by unconditionally accepting them, people come to think of themselves as inferior and helpless, incurring oppressed personalities characterised by fatalism, self-deprecation, and emotional dependence. The learner becomes free of these oppressive ideas not simply by recognising them as oppressive, but by doing something about them. Through praxis, the critical link between ideas and action, the learner becomes more aware and able to proceed.

Most minority groups live in a trance, mesmerised by programmed imposed ideals shaped by the dominant culture which further blunt peoples' sensibilities from perceiving wider realities and debilitates their capacity to liberate themselves from oppressing conditions. In contrast, a critical consciousness strengthens the ability to step back from an unconscious acceptance of things and critically perceive the world, even in the midst of invasive, powerful, restraining forces that tend to distort

and oppress. An education that tries to be neutral promotes the dominant ideology of society and causes the powerless, including the poor, to succumb (Freire, 1970). So a central task for achieving an augmentative pedagogy is to assist learners in critically observing how their life has been constructed by the influential tradition of the dominant group, with such things as standards, norms, values, and rules. In this manner, it avoids accepting matters as they appear. An augmentative pedagogy invites learners to become prophetic thinkers, change-agents and social thinkers.

An augmentative pedagogy designed for adults seeks a centre of unity in the embedded sacred texts of a religious community that breathes in diversity and exhales inculturation as an integrating instrument to unify multicultural communities. This pedagogy searches for a balance guided by the religious principle in which all become equal and all are empowered to serve the world. An augmentative pedagogy brings forth elements of minority cultures to be critically analysed and considered for a mutual and communal transformation that demolishes an assimilationist-subordinated predisposition toward subjugation, fragmentation, and segregation of minorities. An augmentative pedagogy must help minorities, such as Latinos, to see beyond the boundaries imposed by a rational, individualistic, and consumerist society that throttles, thwarts, deracinates and exacerbates their possibilities of becoming full members of society. An augmentative pedagogy creates adult multicultural educational environments that nurture a collective, transformative, and evolving identity designed for both the individual and society. This is a pedagogy that facilitates an interdisciplinary and intercultural conversation in response to personal growth, the building of communities in communion, and the promotion of inclusiveness, diversity, and plurality.

AN OVERVIEW OF ORTHODOX CHRISTIAN RELIGIOUS EDUCATION

Anton C. Vrame

Associate Professor, Graduate Theological Union

Introduction

One of the great struggles that the North American Orthodox Christian Churches have had in the area of Christian religious education has been the rush and pressure to organise programs and prepare materials for educating the next generation. The discipline of Christian religious education is a relatively new phenomenon, emerging in the twentieth century, but not becoming more systematic until the last few decades. In traditionally 'Orthodox countries,' without the experience of Communist rule, such as Greece, Orthodox Christianity has been part of the public school curriculum without interruption since 1833 (Perselis, 1984). There it has the same relative position as mathematics or history. In the former Soviet-bloc nations, the teaching of Orthodox Christianity is returning to public education, with large investments from both Church and State. In Greece, the challenge is to develop meaningful programs within the context of public education. In the former Soviet union and Soviet republics, the challenge is the same, coupled with building the infrastructure—intellectual, practical, programmatic—for the return of religious education. Throughout the Orthodox world, issues of globalization, secularisation, modernity and post-modernity, and especially religious pluralism have made dealing with these matters more complex. The still relatively few professional scholars and researchers—five to ten globally—in Orthodox Christian religious education also have hampered responding to these immense challenges.

In North America, especially the United States, Orthodox Christianity is a tiny minority, comprising less than one percent of the U.S. population, despite the claims and rhetoric of a much larger population (Hartford, 2003). In the United States, the environment with which I am most familiar, religion is not taught in public schools. Thus, Orthodox Christian religious education is a parochial, parish-based, program: the Sunday or Church school. In the United States, the pressure to

develop materials for Sunday school programs has outweighed virtually all other issues of Orthodox education. Again, as in Europe, there have been very few professionals, either at the academic level (scholars at the doctoral level) or within parish life (trained personnel handling education ministries even on a part-time basis). There are currently no full-time scholars of religious education teaching this field in the accredited Orthodox theological schools in North America (Holy Cross Greek Orthodox School of Theology, Brookline, Massachusetts, St. Vladimir's Orthodox Theological Seminary, Crestwood, New York, and St. Tikhon's Orthodox Theological Seminary, South Canaan, Pennsylvania). This task is relegated to adjunct status. At the level of an archdiocesan, or institutional presence, there has been partial development, with small departments and few resources, attempting to guide parishes in the development of their programs. Religious education in parishes, especially in North America and Western Europe, has been largely a volunteer effort of concerned adults seeking to teach children the rudiments of Orthodox Christian belief and practice.

As a result, there have been few sustained efforts at developing a distinctively Orthodox approach to education, although at least since the 1950s the call for such an approach has continually been made. A few scholars, such as Sophie Koulomzin, Alexander Schmemmann, John Boojamra, Constance Tarasar, and George Nicozisin attempted to offer answers to basic educational questions. Building upon their work is a significant aspect of the last decade. Thus, the remainder of this article will be an attempt to offer answers developed thus far by Orthodox educators to the following list of basic educational issues: Why do we educate at all? What are we educating for? How do we envision our educational objectives? What outcomes might we expect from students?

Efforts of the Twentieth Century

In the early twentieth century, Orthodox educators adopted the approaches of others, usually Protestant, without asking questions of ourselves about its appropriateness. Nicozisin (n.d.) reports that in 1927 George Alexander recommended that with some changes the curriculum of the Episcopal Church be used in the parishes of the Greek Orthodox Archdiocese. From his examination it was preferred of all existing other Protestant materials at the time. By the 1960s, the approach had matured somewhat and the various Orthodox communities in the United States had produced their own materials. However, we can see an academic model being employed. According to Vrame (1996), in the textbooks developed by the Greek Orthodox Archdiocese of America in the 1960s and 1970s, we can see the strong influence of an 'academic approach' to Christian education, modeled largely after the methods of the religion texts used in the public schools of Greece at that time and a bit earlier. Each grade deals with a specific topic of religious knowledge, such as Old Testament in one year, New Testament in another, and so on.

In the 1950s, the pan-Orthodox agency, the Orthodox Christian Education Commission was created to unite efforts in education in the Americas. In the texts that it created in the 1960s and later period, we see a strong liturgical emphasis. This could be seen as largely due to the influence of one of the Commission's founders, liturgical scholar Fr. Alexander Schmemmann.

By the 1980s, the Orthodox in America began new textbook development programs, spearheaded largely by the very successful effort of the Greek Orthodox Archdiocese. It began producing beautifully written and produced textbooks in its *Living Our Orthodox Faith* series. The original scope and sequence developed for this series was to produce materials that would lead a student from pre-school to high school. Unfortunately, because of personnel changes, the series stopped being produced after the fifth grade. Thus far, a decade later, there are still relatively few new materials for older students and the original publications from the *Living Our Orthodox Faith* series have yet to be updated. The other major publishing company, the Orthodox Christian Education Commission, has also begun revising and producing new materials. This effort has moved more slowly, producing fewer new works, as this Commission does not have the financial resources to publish materials at a faster pace.

Another issue of education facing Orthodox in the twentieth century was the adoption of the Sunday school held during the celebration of the Divine Liturgy. Families would arrive at the parish together. Children would go off to attend Sunday school while parents would attend the Divine Liturgy. In North America, the Sunday school was adopted without considering whether or not it was consistent with Orthodox ideas about education, involvement in the liturgy, etc.

In the 1970s, especially influenced by the liturgical renewal movement, Orthodox educators realised the Sunday school was not consistent with the ideals of greater participation in liturgical and sacramental life and, especially, more frequent reception of Holy Communion. Children were growing up, going to Sunday school and seldom attending church services. As a eucharistic community this was seen as devastating because the children have no experience of a worshipping community, except perhaps at feast days. The one practice that all adult Orthodox Christians should observe was not being practiced by children, thus not forming the habit of regular liturgical participation from a young age. At a programmatic level, children were learning that education was only for children as the education program ended at graduation from elementary or high school. Adult education programs are still fairly rare in Orthodox parishes. Orthodox educators have been trying to develop new approaches as to when education programs are held. Mostly Orthodox try to hold 'church school' at a time that does not absent them from the Sunday eucharistic liturgy. These efforts typically involve children entering or exiting the Sunday liturgy at various points in order to go to a classroom and not miss key points of the Divine Liturgy. Some parishes have attempted to adopt other times, such as during the service before the Liturgy—*orthros* (matins), or have dared to suggest other days, typically with little success. Despite the riches of Orthodox liturgical life, Orthodox families attend worship services on Sunday mornings and Orthodox parish life revolves around Sundays.

Why do We Educate at all?

All educators typically begin with the idea that education is about 'leading out' some one—the learner—(*e-ducare*), chiefly from ignorance to knowledge. There are also ideas about educating for needed skills in the workplace, personal growth, 'academic' achievement, citizenship, and more. Of course, good educational practices will involve all of them to one degree or another. But educators must recognise the implications of stating the priority of one over another, for example skills for the workplace versus citizenship.

In the area of Orthodox Christian education, we have been asking the same question. Are we educating for discipleship, deep academic theological knowledge, or merely participation in pious practices? At minimum, we could say that the answer to this question was assumed: Orthodox adults teaching Orthodox children about Orthodox Christianity. The texts of the twentieth century assume an Orthodox family, living close to and participating in a parish, following Orthodox practices. Those learners required only Orthodox information for their education. These assumptions were largely accurate and unchallenged. There was no consideration of the wider social and cultural context in which the Orthodox communities found themselves in North America. Essentially the parish community functioned as an ethno-religious enclave—a ghetto, in popular parlance—within the mosaic of the wider American milieu. Thus the textbook developers did not feel the need to develop materials for other realities. Nor did a more explicit or distinctively Orthodox approach need to be articulated. When the Greek Orthodox Archdiocese began a process of reviewing texts in the 1980s, these foundational questions were asked. However, the answers offered were just enough to begin creating textbooks once again.

Some Orthodox were aware of the problem, chiefly Alexander Schmemmann, Constance Tarasar, Sophie Koulomzin, George Nicozisin and John Boojamra, as well as others, the pioneers of Orthodox education in North America. Since the 1950s, Orthodox educators struggled to develop a distinctively Orthodox theology or philosophy of education. Tarasar (1975) reports that this was one of the stated goals of the Orthodox Christian Education Commission, formed in 1956. Some initial attempts were made, but little sustained reflection took place. Twenty years later, Sophie Koulomzin could write that the Orthodox Church 'needs to discover an approach to religious education that is rooted in the total church tradition' (1975, p. 14). The pressure to produce materials was just too great to devote time to the question. Nevertheless, a few of the pioneers began to offer some insights into developing a response to the matter.

Nicozisin (n.d.) pointed to distinctively Orthodox terminology as offering the clues for an Orthodox answer to the question why we educate. He pointed to the term *parakatheke*, to which I would like to add *paradosis*. They are typically translated as 'deposit' and 'tradition.' With both terms there is a clear sense of receiving something. A third, related, term would be *kleronomia*, inheritance. However, with the first two terms, I want to consider them under the light of liturgical use.

The *parakatatheke* is the act in the ordination of the presbyter when the bishop places a portion of the consecrated eucharistic bread symbolising Christ, the *amnos* (the lamb) in the hands of the newly ordained. For anyone who has been ordained, this is a powerful moment of reception, a *paradosis*. However, rather than seeing this act merely as an act of reception, or merely a beautiful tradition, I'd like to see it as a dynamic process of *handing forward* the living Christ to the new presbyter. The command to return it at the second coming is not a command to preserve the small cube of bread and return it stale and dry, but to present the living body of Christ—a church community—to Christ. From this we can extrapolate easily into the realm of education, wherein the teacher hands forward the living Christ to a learner, who is entrusted with keeping the faith alive, in order to be handed forward to another generation.

This is an important concept for Orthodox religious educators because we must actively consider the implications of this idea. Are we handing forward the living Christ or merely stale, dry cubes? Are we even certain that we are handing anything over at all? Peter Berger (2004, p. 34) argues that the 'taken for grantedness' of being born into and being nurtured by an Orthodox Christian parish and family no longer exists. Nearly a decade earlier, Fr. Ion Bria (1996) made an identical claim when he wrote:

the Orthodox realise that the transmission of the faith cannot be taken for granted as an automatic consequence of an uninterrupted historical succession....The gospel has to be preached and taught in every generation, in its own language and symbols. It cannot be appropriated once for all by a particular culture; it has to be liberated for new connections and new praxis (pp. 48–49).

Berger and Bria offer different reasons for their claims about 'taken for grantedness.' For Bria it is the lack of education under Communist rule in Eastern Europe. For Berger it is the loss of a unity of family life, a unity of parish experience, a unity of social life caused by increased mobility, increased wealth, increased options of American life in the last fifty years. The Orthodox population in America has felt the influences that Berger sees. Two-thirds of all marriages in the Greek Orthodox Archdiocese involve a non-Orthodox spouse. Families hustle from church services on Sunday to soccer games. On the holiday weekends, families are often absent because they have traveled to some interesting locale.

Alexander Schmemmann (1983) attempted to provide a foundation for religious education by locating it within the liturgical life of the Orthodox Church. In a monograph, he identified examples of how aspects of the liturgical cycle of the Church were catechetical in nature and, as a result, 'liturgical catechesis' was the traditional method of religious education in the Church (p. 11). For Schmemmann, the aim of religious education was 'to bring the individual into the life of the Church.' This meant that education involved more than imparting religious knowledge or training moral persons, but 'edifying,' literally 'building up' a member of the Body of Christ, the chosen race, and holy nation. 'Religious education is

nothing else but the disclosing of that which happened to man when he was born again through water and Spirit, and was made a member of the Church' (ibid.). Schmemmann also identified the process by which Orthodox should educate: 'O taste and see that the Lord is good!' (Ps. 34:8). Experience before understanding, participation before explanation, was the way of catechesis in the Church.

While Schmemmann, correctly I believe, identified liturgy as central to Orthodoxy's approach to religious education, the remainder of his presentation is an explanation of the liturgical life of the Orthodox. Yet, beyond teaching about the liturgy and possibly leading to a liturgical renewal among the Orthodox in America, significant events certainly, he did not set out a clear foundation for religious education. Nevertheless, his influence was great and can be seen in the liturgical emphasis of the textbooks published by the Orthodox Christian Education Commission, as well as in the effect it had on others who have connected religious education with the liturgical life of the Orthodox Church.

Constance Tarasar is probably the most widely published and best known of all Orthodox religious educators, having been active in the field since the 1960s. She has written on a wide range of topics, presenting and expanding the liturgical perspective inherited from Schmemmann. For example, in one essay she applies the 'taste and see' principle to children's experience of worship: 'The child learns to worship through experience from the very first moments in the Church. The child's first 'understandings' come through the senses' (1983, pp. 51–52). Elsewhere (1981), she uses this principle to re-establish the connection between doctrine and liturgical experience, thus re-integrating catechesis into the life of the Church, in the fullest meaning of that phrase. In her doctoral dissertation (1989), she attempts to develop a curricular plan based on the liturgy of initiation according to educational goals and developmental levels. Most recently (1995), she has made a cogent articulation of the theology of Orthodox religious education focusing on three foundational premises: (1) theology and religious education are fundamentally of the church, (2) theology and religious education are grounded in an understanding of God in Trinity, and our relationship to God and to each other as persons, and (3) theology and religious education must be communicated in their fullness (p. 84).

Another major thinker was John Boojamra. A teacher by profession and a Church historian, he was a founder of the Orthodox Christian Education Commission, the Director of Christian Education for the Antiochian Orthodox Christian Archdiocese of North America until his death in 1999. In a foundational work, Boojamra (1989) pointed to socialization as a model for education that was 'more appropriate to the needs, theology, and tradition of the Orthodox Church, being congenial both to the nature of human development and to the nature and history of the Orthodox Church' (p. 29). While the statement itself may seem unremarkable, in its time Boojamra's thinking showed a significant development in Orthodox thinking on educational matters. First, he seriously engaged the thinking of other Christian educators, notably John Westerhoff and Berard Marthaler. Second, he strove to incorporate the works of developmental psychology, especially the work of Piaget, Erikson, and the then

in-vogue work of Lawrence Kohlberg. Third, Boojamra brought to this conversation the writings of the Eastern Church Fathers and the entire liturgical tradition of the Orthodox Church. Fourth, he was reacting to what he called the 'liturgical captivity' of Orthodox education, stating that the 'Church is more than liturgy' (p. 30). Fifth, Boojamra was an active developer of educational materials, which provided him with a very practical approach and sensibility to the work of education within the life of an Orthodox parish.

Socialization is still an important concept to be included in Orthodox thinking on educational matters. In particular, it obligates program developers to consider seriously the limitations of classroom learning for matters of faith and tradition. Socialization points to the locus of family, parish and community life as the primary and proper focus of education in faith, of which classroom learning becomes one dimension and not the location of all a religious community's educational efforts.

But where is Orthodox Christian education today? Unfortunately there has not been a lot of active thinking on the question. Orthodox education continues to rely upon the ways of thinking from almost a generation ago. Kallistos Ware (2001) writes that holy tradition is not inertia, a thoughtless repetition of the past. Yet in Orthodox educational ministries, that is, the ministries of 'handing it forward,' this is precisely what we have relied upon. While the Orthodox tradition is richly capable of addressing the needs of the present era, the educational or theoretical approach to it is not. We are still operating in the 'taken for granted' mode, taking it for granted that our children, indeed ourselves, dwell in a milieu or culture that sustains and nurtures Orthodox Christian identity and culture. Some may respond that this task is easier in the 'Orthodox culture' of Greece, Romania, or Russia and the like. But under the pressures of European integration, the globalization of the marketplace, the mobility of people, the new media, the internet, etc., this 'Orthodox culture' is being radically challenged. The choices are to attempt to 'roll this back' by either setting up protectionist barriers to foreign ideas, develop sectarian approaches to our faith, or to engage the new reality and educate for Orthodox faith and identity in the new environment. The former is, at best, an untenable naïve project that assumes that the effects of modernity can somehow be minimised. The latter is the better course, also more consistent with the ethos of Orthodox incarnational theology.

In an article published after his death, Boojamra had written: 'In the twenty-first century formal pedagogy will be the single most important ministry in the Church, especially when the culture in which we have chosen to live or which we have ourselves created supports less and less what Christians deem virtuous and ethical' (2000–01, p. 147). Berger pointed out that we must just as effectively evangelise our own, as we must work to evangelise others. If we are to educate and evangelise our own for Orthodox identity, then we must engage in a distinctively Orthodox approach to education that both represents who we have been and are as a church, culture, and people and yet capable of engaging current questions and issues facing our people.

What are We Educating for?

Our next task then is to identify a distinctively Orthodox approach to education. That approach should be clear enough to avoid esoteric abstraction, thus being accessible to practitioners who are mostly amateur teachers or theologians, and rich enough to guide our pedagogical thinking and strategy. In addition, our answers to the question should be valid for childhood education and adult education.

In my work thus far, I have located that approach in the icons (Vrame, 1999). From the icons, I have argued that the aim of an Orthodox Christian education is:

to nurture, instruct, and direct each member of the community of faith—the Church—in Christian living ...(or) the life in Christ, so that each person grows ‘in the grace and knowledge of our Lord and Savior Jesus Christ’ (2 Pet. 3:18) and becomes ‘a partaker of divine nature’ (2 Pet. 1:4). Alternatively stated, the goal of an Orthodox education is for each person to become an icon, a living image of God, a person who lives in continual fellowship—communion—with God, reflecting a particular way—the Christ-like way—of knowing and living in the world...(p. 63).

As I like to call this, ‘iconic living and knowing.’

While Orthodox Christians often have been accused of turning to the icons for answers to questions, I have done so for three reasons. First the icons are distinctively Orthodox or Eastern Christian, and if we want to broaden our geographies it can include the Oriental Orthodox and even the Eastern Catholic. We have a unique, highly developed and integrated tradition of art, theology, piety, and liturgical practice developed around icons. No other Christian tradition can make this claim.

Second, icons are a concrete expression of a distinctive theological tradition. They are good ‘strategic practical theology’ in the way Don Browning defines this phrase. Browning (1991) argues that practical theology should work in the following manner. It should begin with ‘present theory-laden practice to a retrieval of normative theory-laden practice to the creation of more critically held theory-laden practices’ (p. 7). Using Browning’s categories, icons are descriptive theology; they are historical theology; they are systematic theology; and they lead to practical application. That is, icons describe, question, and analyse Orthodox understandings of Christology, anthropology, ecclesiology, scripture, tradition, liturgy and piety. Moving from icon as art form, which is both a practice of art and a practice of piety, to a closer study of their theology and usage, I believe it is possible to engage Orthodox education into a deeper conversation about itself.

Third, icons offer a broad educational foundation, especially in terms of epistemology. Icons, indeed like the visual arts in general, challenge teachers and learners to a more open and dynamic understanding of what it means ‘to know’ something. I believe this is consistent with Orthodox tradition, but it has been lost as we have been too quick to imitate only rationalistic, cognitive, or academic approaches to education. This is ironic because Victoria Clark (2000) has accused

Orthodoxy of having 'lost its mind' (p. 23). To know a teacher/learner must use his intellect and rational skills, but he must also use his physical, psychological, aesthetic, and spiritual capabilities. One must believe, know and do, balancing heart and mind but also including hands. Each of these requires the interplay of multiple ways of knowing, especially if we are to avoid the phenomenon of 'practicing non-believers' or the mindless repetition of practices and statements—sacred inertia. I believe it also places Orthodox education within the middle of the contemporary educational debate, from constructivist ways of teaching, more inclusive understandings of knowledge, the role of visual learning, to broader methodological concerns.

In the icons we first see, then explore the human person in fellowship with God, leading that person to a knowledge and a practice of God's intent for humanity from the beginning. In the icons we also see a community expressing in non-verbal forms what it values most highly for its members. This is not just a theory for a better Sunday school, but a theological approach to education that can begin in childhood and proceed through the life cycle into adulthood. It is not just pedagogy or andragogy in their most technical definitions, but truly 'hypostagogy,' the education of the person for personhood, as theorised by Boojamra (1991). An iconic approach invites us to look at the person, the community, and the person-in-relation then consider the processes by which our ideas persons and community interact so that our educational objectives may be reached.

What are Our Educational Objectives?

Following Thomas Groome (1991, p. 2), I have argued that Orthodox education should 'inform, form, and transform' learners. In my proposal, all members of the community are envisioned as learners and teachers, because humans are created for growth and none of us can cease growing in faith. Without going into too much detail, let me explain this three-fold set of objectives.

Being informed is self-explanatory. Orthodox Christians should be well informed Orthodox Christians, from the basics of reading the Bible, knowing the basic stories of Christian faith, naming the sacraments, *growing* into the details of explaining the particulars of the Ecumenical Councils, Christology, ethical decision making, and moving beyond.

An Orthodox Christian needs to know 'about' his or her faith tradition, being able to state concretely its articles of faith and concern. It is no longer sufficient to practice the faith without some ideas about why and how these practices came to be and continue to be followed. Religious educators today should not underestimate the significance of acquiring religious knowledge. In the multi-religious environment that already exists in the West, it is critical that a believer be able to articulate the basic tenets of his or her faith tradition. This is not meant to be a defensive or apologetic strategy. But as a religious minority in North America, it is not enough to say being Orthodox is 'just like being Roman Catholic, except that our liturgy is longer and we don't accept the Pope.'

To be formed is to recognise that Orthodox have a distinctive *way* of being Christian. This way of being is different from other Christian ways of being or other religious faiths. Boojamra (1989) remarked that the historical approach of Christianity to education was more formational than informational. Indeed, the classical concept of education, as *morphosis* and *paideia* has much more to do with being formed as a person than only being informed (Jaeger, 1961). The lived, formational, reality of Orthodox Christianity involves liturgical styles, norms for piety, reading Scripture, etc. This 'way of life' utilises the information that is common to all Christians and shapes the Orthodox approach to understanding the information. Merely knowing about Orthodox Christianity without lived expression – *being* Orthodox or *practicing* Orthodoxy – is also inadequate for the handing forward of the living Christ to another generation.

In fact, Orthodox Christians are probably formed before they are informed. The practices of childhood are not easily changed, from church attendance, pious practices such as fasting on certain days and seasons, and the veneration of icons, to sacramental participation and prayer. Being formed also makes a typical Orthodox Christian more comfortable with the practices and able to moderate them to meet a particular issue or need, for example, relaxing a fast day because of a medical need. This points to a challenge that many Orthodox have with the 'converts' to Orthodoxy, who behave seemingly 'more Orthodox than those born Orthodox.' Many converts have been well informed as Orthodox Christians, but have not been well formed—a process that takes time. Meanwhile, the so-called 'cradle' Orthodox Christians are usually well-formed, but not well-informed. To be formed requires belonging to and participating in a community over a sustained period of time, wherein one is socialised into the norms and mores of that community. No one can be formed outside of some kind of community, whether it is a family, a parish, a monastery, or a school.

Being formed by and in a community requires an expanded understanding of curriculum, beyond the printed textbook to the entire life of the community. While the life of the community may not change dramatically in this view, our intentionality about community life and our vision of it may change as curricular questions about communities begin to be asked. As Maria Harris (1989) writes, 'The church does not have an educational program, it *is* an educational program' (p. 47). The post-Pentecost first Church offers a description and model for our expanded curriculum today:

And they devoted themselves to the apostles' teaching and fellowship, to the breaking of bread and the prayers....And all who believed were together and had all things in common; and they sold their possessions and goods and distributed them to all, as any had need. And day by day, attending the temple together and breaking bread in their homes; they partook of food with glad and generous hearts, praising God and having favor with all the people. And the Lord added to their number day by day those who were being saved (Acts of the Apostles 2:42–44).

In the community, the parish, we learn how to be an Orthodox person and Orthodox community through our particular forms of worship and sacramental life (*leitourgia*), the way we organise ourselves and live among one another (*koinonia*), the way we serve one another (*diakonia*), including whom we serve and do not serve, the way we talk about or witness our faith to one another (*martyria*), and the value we place on learning and teaching (*didache* or *matheteia*). If we consider the life of the community as the curriculum, our evaluation of the explicit, implicit, and null curricula, as described by Eisner (1979), taking place in our communities can become a very clear measure of our efforts to hand forward our faith.

The explicit curriculum is what we expressly say that we teach and do. The explicit curriculum of all Christians is basically the same. It is the life, example, and teachings of Jesus Christ and His Church. It is the content of the Scriptures and the centuries of commentary and doctrine that has emerged to shape a Christian understanding of the person and ministry of Jesus Christ and its implications for human existence. Of course, each Christian communion has developed its own set of teachings and doctrine explaining these matters, but all Christians begin from the same point. For example, the Orthodox Church will focus on the development of doctrine emerging from the period of the Seven Ecumenical Councils, while Protestant Christians may begin from the days of Martin Luther.

The null curriculum is a bit of a paradox. It is that which we do not teach, which also teaches something. In Orthodox Christianity, we do not teach about the infallibility of the hierarchy because it is not an Orthodox concept. A congregational community will not teach hierarchy at all. In both cases, the student learns something from what is not taught.

The implicit curriculum has two dimensions. First, it is that which is taught by the way we teach or do something. Second, it is the value system at work or the kinds of knowledge we value—rational or behavioral, which affect what our students learn. For example, in an Orthodox explicit curriculum, we may study the teachings of Christ about serving the poor and less fortunate, then the lives of the saints who helped others. No Orthodox educational program would object to this concept being taught in a parish. But what if the parish does not actually serve the poor? The lesson taught is that this may be something Jesus did but not really required of an Orthodox Christian today. Also, what if a service ministry only serves an Orthodox person, or does not attempt to serve a person of a particular race, religion or ethnic background? These would be examples of the implicit curriculum at work. Implicitly what has been taught is that Orthodox Christians only reach out to certain kinds of people.

Finally, Orthodox Christians are called by God to be transformed into God-like beings, living and knowing as God intends us to live. We call this *theosis*, deification, or divinization. Drawing from these concepts from the icons, we might also call it iconic living and knowing (Vrame, 1999). In the ongoing education of personal life, personal study, community life, sacramental participating, an Orthodox Christian learns about, learns how to live and know as God intends each believer to live and

know. In hopefully ever ascending spirals the Christian grows more rooted in his Orthodoxy even as he grows more expansive in his embrace of the world around us.

This manner of viewing Orthodox education aims at having the Orthodox become involved in multiple layers and manners of educational ministry and practice, from parish to colleges and universities. In and through them, there are many outcomes that we hope to reach with our students. I will now share a few general outcomes, skills, or attitudes that we hope our educational practices will nurture.

What are Some Outcomes of Orthodox Christian Education?

Faithful but Open to the Commitments of Others

The Jewish religious educator Michael Rosenak (1987) asks the following question, which I believe is germane to the challenge for Orthodox Christian education: ‘How *does* one really educate a young person, really *help* a young person to become loyal, disciplined by the regimen of revealed norms, and at the same time, curious, open and endowed with an expansive spirituality?’ (pp. 256–257). Teachers and church leaders hope that their efforts at Christian education will lead to a faithful Orthodox Christian. They hope that their students will be able to express their Christianity, both in word and deed, adhering to the norms of Orthodox practice while simultaneously being able to articulate some ideas about why the practice is observed. This is needed to combat the ‘taken for grantedness’ that was mentioned at the beginning of this essay.

Additionally, in the multi-religious, multi-cultural, multi-ethnic milieu that is North America, they also hope that learner will be able to listen respectfully, attend to the faith commitments of others, and be open to the possibility of learning from another. Anastasios Yannoulatos (2003) writes: ‘If we are to promote the development of a global community we must have a genuine understanding of the most profound pursuits and intellectual accomplishments of other cultures. This includes understanding their religious achievements’ (p. 43). A civil society must allow for the free expression of religion, but also nurture a spirit of religious tolerance and respect for diversity. One of Orthodoxy’s great educational challenges, one that I fear we are not doing very well at, will be on this point. Can Orthodox be successful educators without resorting to triumphalism, arrogance, sectarianism, or worse yet, open condemnation and rejection of people of other faiths and backgrounds?

Community Builders, Leaders, and Servants

Orthodox educators should hope that their educational efforts lead to the development of the body of Christ, from the smallest unit—the family—to the largest—the culture or nation where appropriate. Building the body means that all aspects of the life of the church—clergy and laity—together share in the common work of the kingdom of God. All have the potential to lead through service. All are servants, even as some are appointed leaders with power, responsibility, authority,

and accountability. In North America, where a strong spirit of volunteerism has existed historically and religious communities receive no government support for their religious work, education, by necessity, should foster greater community involvement. Through the educational enterprise, teachers and leaders hope that their students and members will take on roles of responsibility and leadership in their communities, from getting involved in parish committees to studying for ordained ministries. One of the ongoing challenges is that many lay community leaders are not well-educated in their Orthodoxy, when many who are well-educated either are not asked to become involved or stay at the margins, refusing to get involved.

Recognise Theological Knowledge as but One Dimension of Christian Knowledge

Typically, Christian knowledge has been narrowly defined as 'religious knowledge.' An Orthodox educational vision must find ways to connect religious knowledge to other forms of knowledge, from the arts to the sciences and make these connections at multiple levels, from the everyday, the professional or vocational, to the expert theologian.

At the vocational or professional level it could take the following form. I would like my physician to be well informed to practice medicine, but also well formed by the values of the medical community and his or her faith tradition, and hopefully transformed by them. I would like my physician to be a good doctor, but also have a relationship to the ultimate Physician of souls and bodies and recognise that there are limits to what medicine can accomplish. A pious Orthodox doctor who cannot diagnose an illness and develop a treatment plan is not going to help many people. On the other side of this, churches should be working to assist the faithful discern how God is involved in whatever vocational path they choose. A 'calling' as we think of vocation is not limited only to clergy. God calls each person to his or her profession, whether policeman or physician.

At the level of the discipline of theology and religion, it must be in dialogue with other areas of inquiry and discourse. Just as theologians have begun to explore the realm of bioethics, theologians should begin exploring the realm of information technology, sociology, anthropology, etc. This may be due to the reality that Orthodox theological scholarship thus far has been 'macro-theology:' historical, patristic, biblical, systematic and doctrinal, ethical and liturgical on 'big questions.' As macroeconomics provides theories and explanations of 'supply and demand,' or how monetary and fiscal policy policies affect national wealth, Orthodox scholarship thus far has dealt with the large sweeping issues of doctrine and theology. For example, Orthodox ecclesiology has offered the macrotheology of the 'church as communion.' On the other hand, there has been very little 'micro-theology:' pastoral, practical, or applied investigations. There is little information of how parishes and individuals appropriate the theology of conciliarity or live in a conciliar manner. Just in the area of Christian education in North America, a cadre of twenty or thirty specialists, at minimum should be developed and hopefully employed

within archdiocesan administrations and various educational ministries, including the theological schools.

Too many Orthodox theologians continue to fight battles that have already been won. The Orthodox need to develop a generation of theologians who are just as comfortable with economic or social analysis as they are with patristic nuances. The challenges Orthodox Christianity faces today require thinkers and leaders capable of what Ronald Heifetz (1994) calls 'adaptive work.' 'Adaptive work consists of the learning required to address conflicts in the values people hold, or to diminish the gap between the values people stand for and the reality they face. Adaptive work requires a change in values, beliefs, or behavior' (p. 22). While Orthodox Christianity does not require a change in beliefs, doctrines or dogmas, it certainly needs work in the areas of behaviors and policies, and the gaps between how our people live and understand their lives and the means we use as a religious community to help them understand contemporary challenges.

Authentically Strive to Fill the Spiritual Hunger that Exists Today

Orthodox educational practices should be life-giving and life-sustaining. Jesus says in the Gospel of John, 'I came that they may have life in abundance' (Jn. 10:10). There is a joke in the United States that says that theologians are people looking for answers to questions no one is asking. Orthodox people are turning to all kinds of sources for spirituality and religious communities because it is those sources and communities that are meeting their needs, answering their questions, engaging their minds and hearts. The 2004 film by Mel Gibson, 'The Passion of the Christ,' has grossed well over \$500 million. The film generated an open and very public debate in the United States about the story of Jesus and His Passion that has not been experienced in decades. People have flocked to see it and leave the theatre claiming that the film has changed their lives. Churches and church groups have bought thousands of seats and filled theaters. Many of the seats in the theaters have been filled by Orthodox Christians who were more than just curious about the film. Clergy encouraged their parishioners to see it. Some Orthodox reported that they finally understood the events of the Passion. Clearly these people have left the theatre having many questions about Christ answered that Orthodox Holy Week services, educational programs, and homilies have not. This phenomenon also points to the power of the visual in education.

Also, an Orthodox education should not become a means to manipulate others in and into a church community, but should attempt to offer a vision of life that allows questions to be asked, sources to be studied, and answers to be explored. Orthodox education should lead to Orthodox adulthood, maturity in Christ, persons who are not dependent on the whims of a spiritual guru, but capable of thoughtful self-direction in conversation with a guide, in order to deepen one's experience of the life in Christ. As St. Paul writes, the task is

to equip the saints...until all of us come to the unity of the faith and of the knowledge of the son of God, to maturity, to the measure of the full stature of Christ. We must no longer be children, tossed to and fro and blown about by every wind of doctrine, by people's trickery, by their craftiness in deceitful scheming. But speaking the truth in love, we must grow up in every way into him who is the head, into Christ (Eph. 4:13–15).

In conclusion, I have argued that Orthodox educators should begin by exploring the foundational educational questions, the why and what of any educational endeavor. There are also other foundational questions that Orthodox should be asking. They include What is teaching, the role of the teacher? Is there a preferred educational approach, style, or method? What is the role of schooling? How do we evaluate Orthodox education? There are also questions of adult education, life-long learning, and theological education that must be addressed as well. The questions that I have raised in this presentation – Why do we educate at all? What are we educating for? What are our objectives? and What are some outcomes we look for? – are the first questions that those responsible for education must deal with in order to guide the educational enterprise. I suggest that we locate the answer to Orthodox education in the icon of the living Christ, the artistic *parakatatheke* of our tradition, which we hand forward to each person in the life of our community.

SECTION TWO

INTRODUCTION TO SECTION TWO: RELIGIOUS EDUCATION AND DEBATES ABOUT PLURALITY AND CULTURE

Robert Jackson

University of Warwick, UK

This section of the book is concerned broadly with issues of religious education and culture. The contributions reflect recent debates about the relationship between religion and culture against the background of the wider debate about modernity and post modernity. The contributions are mainly from different parts of the Western world (including Europe, North America and Australasia), with Turkey and South Africa providing links to the continents of Asia and Africa respectively.

Inevitably, some technical terms are used differently in certain countries, a point complicated by the fact that some chapters are translated into English from other languages. In particular a note needs to be made about the use in English of the term 'religious education'. In England and Wales, 'religious education' refers usually to the subject taught in state-funded community schools. This subject is not concerned with the transmission of religious culture from one generation to the next. Rather, its key goals are to promote knowledge and understanding of different religious traditions for all pupils in the common school, together with some reflection by pupils on what they have learned (QCA 2004). Thus, the chapters by Eleanor Nesbitt and myself use the term 'religious education' in this sense. Norwegian contributors also tend to use 'religious education' in a similar way, corresponding to the curriculum subject KRL (the study of Christianity, other religions and philosophies: see the chapter by Geir Skeie, for example). However, some contributors use the term 'religious education' specifically to mean something close to 'religious upbringing'. In the UK, writers would tend to use the term 'religious nurture' in this context (as indeed does the Norwegian contributor Sissel Østberg). The terminological distinction is especially important for contributors from certain countries. For example, David Chidester, writing about the situation in South Africa, explains how the term 'religious education' is specifically avoided in the context of a pluralistic study of religions in schools, conducted according

to human rights principles. Instead, the term 'religion education' is used in order to avoid overtones of nurture, instruction or indoctrination. Similarly, Bruce Grelle, in his chapter about the possibilities for introducing studies of religion into public schools in the USA, points out that 'religious education' would not be an acceptable term to describe the subject. Mireille Estivalezes, writing of the current debate in France, uses the English expression 'teaching about religion' instead of 'religious education' for similar reasons.

Some scholars make the distinction between 'non-confessional' and 'confessional' religious education, with 'non-confessional' corresponding to the kind of approach adopted in English state-funded community schools. The term 'confessional' is used in at least two different senses. The first refers to systems of education in which the sponsoring organisation (usually in collaboration with the state or a sub-division of the state, such as the *Länder* in Germany) is a religious body. The second refers to the nature of religious education itself. In this sense, the defining feature of confessional RE is its assumption that the goal of the subject is to nurture faith and that the contents of RE, and the development of curricula and teaching materials, are mainly the responsibility of religious communities as distinct from the state. It is important to make the distinction between these two meanings, since it is possible, as with some German *Länder*, to have a confessional education system but non-confessional religious education, in the sense of offering considered choice, rather than the intention of a particular outcome. In other words, there are cases in which schools are sponsored by a particular religious body, but the ethos of religious education is one of principled pluralism. It is also the case that some writers from within religious traditions, who themselves embrace postmodernity, no longer see the goal of religious education as being to foster a *particular* faith. Philip Hughes' contribution below is a case in question. Having made these points about different uses of descriptive terms, it should be relatively straightforward for readers to see from the context how 'religious education' and its variants are used in the different contributions. The contributions below are arranged under five headings.

Part 1: Postmodernity, Plurality, Religion and Culture

Part one covers aspects of the debate about modernity and postmodernity in relation to religious education in a pluralistic context. Geir Skeie's opening chapter maps the terrain and makes some important conceptual and terminological distinctions. He points out that, following an earlier preoccupation with secularisation, the main issue in religious education today is diversity of religions, worldviews and values. This shift of emphasis also reflects an increasing interest in the socio-cultural context of religious education. Skeie uses 'plurality' as a term for understanding and describing religious diversity, while he uses 'pluralism' as a normative expression, indicating where a positive evaluation of diversity is being expressed. He makes the further distinction between the description and analysis of plurality, using the term 'traditional plurality' to refer to group based religious and cultural diversity, and the term 'modern plurality' to describe (post-)modern fragmentation, functional

differentiation and privatisation with a focus on individual identity. Skeie's key point is that religious education must take on the challenge to include the context of modern and traditional plurality both in theoretical reflection and in teaching approaches. Religious education should not give 'answers' to young people, but should initiate them into the debates at their own level, so they are equipped to formulate their own views in relation to the wider debates in society, focusing on children and young people as actors and learners. This approach demands a pluralistic attitude towards different approaches and perspectives as well as a critical debate.

One of the debates that Skeie alludes to is the one about culture and cultures. Empirical evidence from ethnographic studies (see the contributions of Nesbitt, Moore and Østberg below, for example) shows the 'traditional' model of clearly distinct cultures, pictured as separate or overlapping circles, to be quite inadequate to show change over time and especially to indicate the mobility and flexibility of *individuals* in different cultural situations. This is not to imply a complete deconstruction of cultures, as with the more extreme versions of postmodernism. The notion of cultural continuity is neither inconsistent with the complex and contested nature of cultural change, nor with disagreements over the ways in which cultural pasts are constructed and used in the present. The debate should be less over whether or not there *is* cultural continuity, but over the ways in which it is conceived and represented. As well as seeing a person as part of a continuing cultural tradition, it is also possible to observe that person's engagement with material from a variety of cultural sources. Attention needs to be given to *both* of these processes if we are to give an account which coheres with the complexities of what actually happens 'in the field', as opposed to ideological statements of what people would like to happen, whether they be at the poles of traditionalism (separate and distinct 'cultures') or postmodernism (the idea of 'a culture' as a completely redundant concept). This issue of the nature of cultural continuity and change is raised in many of the contributions in this section.

In the next chapter Wilna Meijer extends Skeie's discussion by accentuating its historical dimension. She notes that in the last decades of the twentieth century a pluralistic approach to religious education developed in the schools of various multi-cultural and multi-religious societies of Western Europe. Its educational aim is the promotion of knowledge and understanding of religion in its various forms. Her key argument, echoing my own work on interpretation and reflexivity in religious education (see my chapter below and Jackson 1997, 2004, forthcoming), is that such knowledge and understanding needs to relate to the learner's personal development. In this vein, she articulates the concepts of identity and tradition that suit pluralistic forms of religious education, mainly from the perspective of the hermeneutical philosophy of Hans-Georg Gadamer and Paul Ricoeur. Her central idea is that both the personal identity of the individual, and tradition—necessarily something collective and shared by individuals—are matters of interpretation and are, as such, open to change. By examining or 'recovering' one's own traditions, one may interpret them in new ways that potentially reshape oneself. By examining the

traditions of others, one may learn more about oneself. In this way reflection and historicity are incorporated in the concepts of identity and tradition, as are plurality and conversation.

The next two chapters give contrasting responses to the context of late or post-modernity in terms of views about the nature and practice of religious education. Andrew Wright expounds and defends critical realism as the most appropriate framework for a liberal religious education in the face of the complex religious and cultural plurality, as described by Skeie, for example. Whilst acknowledging post-modernity (in Skeie's descriptive sense), his normative position defends a critical realist epistemology in which the pursuit of truth is central. Wright argues that critical realism provides a context which maximises reasoned debate and allows the pursuit of truth and truthfulness whilst maintaining the principles of freedom of belief and tolerance of the beliefs of others. Such a context, Wright argues, can provide a setting for teaching and learning that allows students to articulate, to develop and to defend their own views. Wright is critical of approaches he regards as having 'loaded' methodologies, such as those that reduce religious education to the sole task of nurturing the virtues of freedom and tolerance, or which *presuppose* that religion is primarily a product of human culture. Wright is not making foundational claims for critical realism's status in relation to religious education, but arguing for it as the best working framework currently available.

Writing from within the Australian education system (where religious education is understood in the private sector as religious nurture), Philip Hughes discusses the nature and practice of the subject from the point of view of young people living in a postmodern context, arguing for a particular educational response to the plurality of late or post-modernity. He argues that approaches to religious education which continue to attempt to pass the traditions of faith from one generation to the next are no longer effective. In a postmodern environment, young people now draw on a wide range of resources, including religion and spirituality, in shaping their identities. They do this in highly individualistic ways rather than by accepting the dogma of a religious community or religious organisation. Through the globalisation of the mass media, personal travel and the multi-faith nature of most Western cities, young people have become aware of the many options from which they can draw for their spiritual well-being, and they tend to approach spirituality as consumers. At the same time, they are wary of the organisations which traditionally have been guardians of religious traditions. As distinct from Wright's view that religious education should deal openly and fairly with issues of truth in relation to the narratives of particular religious traditions, Hughes argues that the subject should now be oriented towards helping each individual to develop skills to make wise and responsible choices in selecting appropriate and personally satisfying spiritual values from a range of sources; individuals, in Hughes' view, should take responsibility for their own spiritual journey. The risks that young people will not find resources which will contribute effectively to their own well-being or to that of the wider community are great, argues Hughes, because individuals may not have the skills to find and assess them. Thus, instead of seeking to pass on one tradition, religious education

should prepare young people to distinguish between different qualities in spiritual resources, and to evaluate their authenticity. Young people can be empowered to make wise choices, maintains Hughes, through the provision of background information on the various options, and through building skills in decision-making.

Part 2: Religious Education and Values Education

Part two of this section on ‘religious education and culture’ includes two chapters that discuss religious education as a contributor to a wider values education. The term ‘values education’ here is used as an umbrella term for a range of common curriculum experiences covering subjects such as personal and social education, religious education, intercultural education and citizenship education as well as themes such as the environment and health, and issues related to the general ethos of the school (Taylor, 1998). Neither author reduces religious education to values education, but both maintain that the study of religions offers something distinctive to education in values.

Fernand Ouellet’s chapter considers the relationship between citizenship education and religious education against the background of postmodernity. Just as Skeie and Meijer see questions of individual identity as mirroring tensions within wider society, Ouellet argues that both citizenship education and religious education should act as a bridge between the student’s personal agenda and broader social and political issues. Following Galichet, Ouellet sees the contemporary interest in citizenship education as prompted by contradictions and tensions in relation to values faced both by democracies and by individuals in a postmodern situation. Rather than being a ‘comfortable’ subject in which students are initiated into a stable set of social values, citizenship education, maintains Ouellet, should be about learning to manage (and if possible to reconcile) different and sometimes contradictory values which societies and individuals use in different contexts to legitimate particular policies or practices, or indeed to justify particular conceptions of citizenship. The study of controversial issues thus has a central place in this form of education. Ouellet argues that an exploration of religion—through its symbolic systems and questions of meaning and its various responses to postmodernity—is especially relevant in helping students to come to terms with the ‘crisis in the legitimacy of values’. Such a ‘religion education’, argues Ouellet, should be set in the framework of the broad values of openness to diversity, social cohesion and equality. Finally, Ouellet discusses recent policy proposals for ‘religion education’ in Quebec in the light of his deliberations. Here we find some interesting parallels to, but also differences from, proposals and policies relating to France, South Africa and the USA, as discussed in Part 4 (below).

Liam Gearon presents some provisional and outline considerations for religious education of a new ‘human rights culture’ in the UK and globally, in part deriving from the implementation of the Human Rights Act in the UK and other international human rights legislation. Gearon argues that that religious education needs to take more account of the political implications of teaching and learning in the

representation of religious traditions. He thus aims to balance a utopian agenda for religious education with the global and often dystopian realities of cultural conflict—especially involving human rights in an international context. He urges too that particular account be should be taken of postcolonial criticism as a means of clarifying inherent power relations within and between religions and cultures, a theme taken up later by John Wright in his discussion of religion and education in New Zealand.

Readers are also directed to Section Four on Policy edited by Andrew McGrady, which also includes chapters relevant to the debates about religious education in relation to citizenship and human rights education.

Part 3: Methodology

Part three addresses issues of methodology in the fields of the study of religious culture and religious education. Empirical studies are necessary both for gaining insight into the richness and complexity of religious and cultural life ‘on the ground’ in the context of late or post-modernity, and for informing religious education theory and pedagogy. Three examples are given, all making use of qualitative, ethnographic research methods.

Eleanor Nesbitt begins by arguing that effective education (and not only religious education and citizenship education) must necessarily be intercultural, regardless of location and degree of diversity in the local population. She then goes on to introduce ethnographic studies conducted in the Warwick Religions and Education Research Unit at the University of Warwick’s Institute of Education in the UK. She goes on to explore the meaning of ethnography and to examine the appropriateness of religion as a framework for the Warwick studies. Nesbitt examines some insights arising from these studies, including the diversity of supposedly more homogeneous faith constituencies and the fuzziness of the boundaries that are widely assumed to demarcate faith groups. She illustrates the danger of assuming that researchers and those whose experience is being researched use and understand key terms in the same way, and then examines the extent to which young people exercise choice in their beliefs and practices—empirical evidence that informs the debate about ‘cultures’ discussed above (and also, one might add, debates about ‘religion’, ‘ethnicity’ and ‘national identity’). Nesbitt shows that studies of groups within religious traditions, such as supplementary classes organised by religious communities, are very relevant to mainstream educationists. She concludes the chapter by considering some practical implications for teacher education. These include developing a critical awareness of one’s assumptions and paying vigilant attention to published resources, as well as adopting a pedagogic style that encourages an interpretive approach.

My own chapter describes the development of the interpretive approach to religious education from ethnographic studies of children from different religious backgrounds in the UK, including some of Nesbitt’s studies referred to in the previous chapter. Here, the diversity of religious practice on the ground raised questions about the nature of religions that were illuminated by literature

on the representation of religions since the European Enlightenment. Issues of understanding another's religious worldview were tackled through the application of techniques developed through a critical review of recent ethnographic theory and method. The methodology of recent social science also clarified various issues concerned with reflexivity, understood in terms of different elements of the relationship between the student (or researcher) and the examples of religion studied. Although the approach had its grounding in ethnographic theory and practice, its essentially hermeneutical nature has led to developments of the approach, starting in the classroom with key concepts or with students' questions and concerns, rather than with ethnographic data. The approach draws on the social sciences for its methods, but its outlook remains 'epistemologically open' and, as with Andrew Wright's critical realist framework, it leaves open questions of truth as well as meaning.

Mary Elizabeth Mullino Moore combines a reflexive ethnographic methodology with an ethogenic method for studying community life. So far, the method, which Moore and her colleagues have adapted from the work of Rom Harré, has been used largely to study the dynamics of Christian communities within a matrix of cultures. In addition to conventional ethnographic methods (including participant observation), the ethogenic method includes 'listening to people explain their behavior, drawing upon the linguistic capacity of humans to explicate the origins and reasons for their actions'. Its goal is 'to discover influences and origins of social behavior and to understand the dynamics of social interaction'. The main focus of Moore's research has been on processes by which communities construct, transmit, critique, recreate, and transform themselves. A further element has been to consider how diverse cultures and communities teach. Moore's methodological description offers a guide for future research, as well as a qualitative approach for studying social interactions and movements, social influences on human development, and educational practice in complex cultural settings. The underlying theoretical assumptions are that: faith is understood and formed differently in different communities; differences are important to the design of educational practice; faith communities are related to religion and culture in a complex manner; and human beings are interconnected and mutually influencing. Ethogenic research centres on listening to stories. Material is collected in various ways, including formal interviews, observations, questionnaires, and informal conversations. In collaboration with community representatives, the research team 'negotiates the complexities and differences to discover the community's story, with all of its diversity'. The final phase of ethogenic research—drawing out proposals for future practice—echoes Meijer's idea of the potentially transformative nature of education through engaging with past traditions.

Part 4: Case Studies of Religion in Public Education

Part four offers discussions of cultural and political difference and debate through case studies of possibilities and problems relating to policy on religious education in the context of public education in a selection of different countries. Recurrent

themes include the debate about the nomenclature of the field (as indicated above, even the title 'religious education' is controversial, sometimes seen as inherently favouring religious interests), the political debate about the nature of 'religious education' in relation to national identity, the history of civil society and civil religion and the impact of plurality upon education. Different possibilities for the subject in publicly funded schools reflect particular histories and a diversity of views on the place of religion in public and private space, but there are also some indications of influence from broader political, religious and moral perspectives, ranging from the impact internationally of the events of September 11th 2001 in the USA and their ongoing consequences, through the transnational political activity of certain religious interest groups, to appeals to the moral force of universal human rights codes.

David Chidester writes about religion in public education in post-apartheid South Africa, a field in which he has been closely involved since the establishment of a democratic government there in 1994. He describes how, under the apartheid regime, a particular kind of Christian nationalist confessionalism required pupils to embrace prescribed religious convictions and to denigrate adherents of other religions. Chidester tells the story of the process of introducing a new curriculum for religion education (a term preferred to 'religious education') with aims that are clearly educational rather than religious. This is taking place within the context of a Constitution which safeguards human rights and forbids discrimination on religious grounds, thus ruling out any form of 'privileged' religious education. Chidester traces the processes involved in arriving at the new curriculum proposals. Current curriculum statements specify that religion education should address diversity through the study of different 'belief systems and worldviews' and that the role of religion in the public schools 'must be consistent with core constitutional values of a common citizenship, human rights, equality, equity, freedom from discrimination and freedom of religion, conscience, thought, belief, and opinion'. It is on these grounds that public schools are responsible for teaching about religions in ways that are different from the processes of religious upbringing provided by the home, family, and the religious community. Chidester also charts the opposition to these proposals by a number of Christian groups, most of which wish to see the privileged position of Christianity maintained. Chidester sees such opinions as special pleading, arguing that the new proposals are the best way forward for religion education in South Africa's schools.

Recep Kaymakcan introduces us to the situation in another country experiencing rapid change, namely Turkey—a secular country constitutionally, but with a mainly Muslim population, and with territory in both the European and Asian continents. The changing relations between religion and state, argues Kaymakcan, account for the on-going debate about the place of religious education in schools, a process accelerated by the impetus towards membership of the European Union. Kaymakcan provides information on the historical background and legal provision for religious education. He explores the main features of the traditional teaching of Islam, which he defines as an 'ilmihal-centred approach'. This included provision of

knowledge about religion in general, the Islamic religion, and ethics, as well as having a moral development goal. This approach used a classification system that divided religions by origin (whether divine or non-divine); then subdividing divinely originated religions into distorted and undistorted religions. Kaymakcan compares this with recent changes, introduced in 2000, which introduce a new and more pluralistic primary curriculum for religious education. The new approach is non-denominational, inclusive of non-Islamic religions and incorporates a consideration of the cultural dimension of Islam in relation to Turkish history. There is also a shift in pedagogical style to problem or learner centred teaching instead of content centred teaching. Kaymakcan points out that, although there is general agreement about the inadequacy of the traditional way of teaching religion, there is, as yet, no national consensus about alternative approaches to teaching religion in schools.

Using my book *Rethinking Religious Education and Plurality* (Jackson, 2004) as a foil, Bruce Grelle discusses the possibilities for the inclusion of the study of religion in public education in the United States of America. Grelle points out that the debate about the academic study of religion in public educational institutions in America is ongoing, although the subject would never be called 'religious education' since this phrase has unacceptable connotations in the context of U.S. history (cp Chidester's and Ouellet's accounts of 'religion education'). However, in the past twenty years or so, there has been some movement in the United States towards inclusion of religion in the curriculum of publicly funded schools. There is also significant agreement regarding basic pedagogical guidelines for *how* to teach about religion in public schools. Rooted in the religious liberty principles of the First Amendment to the United States Constitution, these guidelines reflect current law regarding religion and public education, making a sharp distinction between teaching *about* religion in public schools and the promotion of religion. Like current English and Norwegian approaches to religious education, for example, the primary aim of teaching about religion in American public schools has been to increase pupils' understanding of different religions in history and society as well as to increase tolerance and sensitivity toward people of different faiths and philosophies. However, the approach would be wary of methods which relate material studied to students' own beliefs and assumptions and with the development of their religious or spiritual identities. This would be regarded as a deviation from the requirement that public schools should be entirely neutral in areas of religion. Grelle suggests an alternative way of making the connection between knowledge and understanding and pupils' personal lives, namely through linking religious education to citizenship education, with an emphasis on the rights and responsibilities of citizenship in a pluralistic democracy. 'Teaching about diverse religious and secular worldviews and ways of life', argues Grelle, 'becomes a venue for helping students understand their rights to religious liberty or freedom of conscience as well as their responsibility to protect those same rights for their fellow citizens', a view he regards as close to my own arguments about the contributions that RE can make to citizenship education (Jackson 2003; 2004).

There are some similarities with the debate about the place of the study of religions in public schools in the USA in Mireille Estivalezes' discussion of the recent debate about 'teaching about religions' in the French public education system. A century has passed since the laws on the laicisation of education prohibited religious instruction in French schools during school hours and on school premises. However, there is now serious public concern about the lack of knowledge and understanding of religions among young people in society, an issue exacerbated by a decline in the importance of the humanities in the education system as well as by the processes of secularisation. Estivalezes traces the debate since the 1980s in which the young's ignorance of religion in relation to aspects of culture such as history, philosophy and the arts became a public issue. By the end of the 1980s, the majority of the population was in favour of teaching the history of religions in schools. However, the reasons given for this were mixed, ranging from the academic/cultural argument outlined above through a desire to increase tolerance of difference among young people (both arguments used in USA debate) to a wish to transmit secure moral values. The move towards a policy change was given added impetus by the events of 11 September 2001 in the USA, and the philosopher Régis Debray was commissioned to produce a report on the topic for the Minister of Education. Debray's positive conclusions have led to a move towards studies of religion in order to promote the preservation of cultural heritage, the promotion of tolerance and the fostering of understanding of the contemporary world. Estivalezes discusses the on-going issues, including the impact of the 2004 Stasi Commission and the important question of teacher education and training.

Part 5: Ethnic and Religious Minorities and Religious Education

The final section focuses on studies of religion and religious upbringing within particular groups and communities in Western societies. The presence of religious and ethnic minorities in society has implications for religious education in a number of ways. Firstly, as Eleanor Nesbitt points out in her chapter, studies of such groups illustrate the diversity and complexity of religion in the field. Terence Lovat's examples of Hindu life show that tradition's complexity and plurality, just as Sissel Østberg's examples illustrate the distinctiveness of local Pakistani Muslim traditions. Secondly, the presence of religious and ethnic minorities also shows cultural change in process, especially across the generations and through the influence of place. This can vary from religious and cultural conservatism, as elders attempt to preserve religious and cultural traditions (as with Richard Rymarz's examples in relation to Christian Orthodox communities that have become established in Western countries such as France, England, the United States and Australia), to more progressive positions in which ideas are filtered through new cultural syntheses. The question of the relationship between religious and ethnic identity is also raised, as is the general issue of the shifting nature of ethnicity. The 'integrated plural identities' displayed by Østberg's young Norwegian-Pakistanis are a good example of the process of cultural change and contextually adaptive ethnic expression. Thirdly, the presence of minorities

provides data for religious education that can break religious, ethnic and cultural stereotypes. Ethnographic source material can be introduced, for example, through the interpretive approach. Also, when it is practicable to link young people from different backgrounds together—either face to face, within the multicultural school, or by some form of inter-school contact, such as email exchange—dialogue between those of different backgrounds can be facilitated (Jackson, 2004, Chapter 7).

Terence Lovat draws on documentary and empirical work from his empirical research conducted during the 1990s and the early part of this century. The work began by focusing on the regular adherents of a major orthodox Hindu Temple site in Sydney, and expanded to take in those more broadly Hindu-inspired groups that tend periodically to gather around such sites. The main focus among these latter groups was the Brahma Kumaris (BK). Lovat's initial objective was to identify the role and purpose of innovations in the New South Wales public curriculum centred on religious studies and values education. This important though limited objective expanded along with Lovat's own increasing appreciation of the unique world of Hindu-inspired spirituality, facilitated through visits in India, Europe, the UK, the USA and other parts of Australia. Among other dimensions, the work captured important perspectives on: religious education in a multi-faith society; the increasing need for religious and values agendas to be pursued in the public curricula of such societies; the phenomenon of cross-religious dialogue between Jews, Christians and Hindus; issues of separation, re-adherence and conversion of Jews and Christians towards Hindu-inspired movements; and the distinctive contribution to be offered to cross-religious interaction by Hindu and Hindu-derived spiritualities.

Sissel Østberg's chapter is based on two empirical studies she conducted on the role of Islam in the lives of Norwegian Pakistani children and young people. The same children and young people were studied over a ten year period. Østberg shows the everyday life of these children and young people to be characterised by a continuous movement, communication and negotiation between a secular context and an Islamic nurture managed by parents and the mosques. She first discusses the concepts of secularity, plurality and deconstruction in order to understand the context of children's and young people's lives. She goes on to analyse how meaning and social belonging are established and negotiated in this plural context. Some of the general social and cultural processes which influence children's and young people's lives as individuals and as a minority group are then illustrated by the multiple roles of the mosque and the state school in the minority situation. Echoing Skeie and Meijer's interest in identity issues, Østberg finally illustrates how Norwegian Pakistani children develop what she calls 'integrated plural identities' and how they as adolescents experience and reflect upon changes in their lives and, in different ways, seek authenticity in balancing individuality and tradition.

Richard Rymarz writes about issues in the transmission of religious values to young Orthodox Christians in a secularised society. In handing on religious values, Orthodox Christians have relied heavily on the lived experience of faith. The primary vehicle for this has been the Divine Liturgy as well as a variety of rich cultural practices. The fabric of Orthodox life, however, is challenged by the patterns of life

in modern Western democracies. Rymarz explores how Orthodox Christians respond to these challenges, with a special emphasis on the role of religious education within Orthodox educational structures. Despite a significant historical interest, Rymarz notes that religious education in Orthodox Church related settings has not been as well developed as in other Christian circles, and he suggests some reasons for this, as well as suggesting future directions.

Whereas the contributions of Lovat, Østberg and Rymarz are concerned with issues relating to minorities within Western societies whose ancestors migrated from other parts of the world, John Wright is concerned with issues relating to Māori indigenous people in New Zealand. Wright considers the implications of the 1840 Treaty of Waitangi for Christian theological education in that country. Given the current centrality of the Treaty of Waitangi to all aspects of the life in New Zealand, Wright sees implications for the delivery of education at all levels, from pre-school to tertiary. He gives a brief summary of the history of education in New Zealand, and explores current delivery methods. He then provides a case study of the delivery of tertiary theological education within the Anglican Church in New Zealand, which is an outcome of a three *tikanga* (custom) Church. Wright offers some educational principles, in the post-colonial context, including the application of Paulo Freire's thought in developing a transformative education that addresses the country's particular mode of cultural diversity.

PLURALITY AND PLURALISM IN RELIGIOUS EDUCATION

Geir Skeie

Faculty of Arts and Education, University of Stavanger, Norway

From Secularisation to Pluralisation

A recent comparison of religious education in Germany and United States in the twentieth century shows that a preoccupation with modernity was central to many religious educators at the beginning of the century (Osmer & Schweitzer, 2003). Later, this liberal and optimistic view of culture and society met with criticism, and gradually the focus shifted towards the religious content of religious education. In the last half of the century, attention returned to the social and cultural context, and issues of secularisation became higher on the agenda in Western countries. There was also a concern about young people's 'drift' away from traditional values, their decline in religious commitment and their lack of interest in organised religion (Skeie, 2002a). Much religious education came to focus on how to teach religion to the children and young people living in secularised societies. This resulted in new pedagogical approaches, as well as curriculum changes, in many countries. Researchers became more interested in the life-world and spirituality of children, partly with a developmental perspective, and partly with a growing interest in the content of children's own philosophy of life as well as the socio-cultural context of their reflection process (Hartman, 1986; Hyde, 1990; Jackson & Nesbitt, 1993).

In earlier social science, secularisation was often seen as a necessary result of modernisation, but by the 1960s this view had become debateable. Today both the concept and the theories about secularisation are contested, partly because many researchers employ a more global perspective. The tendency seems to be more towards investigating a process of 'oscillation between secularisation and sacralisation', and discussing 'conceptions of religion and spirituality' (Beckford, 2003, pp. 71–72). Parallel to this, religious education gradually discovered that young people were interested in religious questions, in spirituality and in ethical

issues; but not necessarily in mainstream religious education in schools, as a Swedish investigation showed in 1969 (Skolöverstyrelsen, 1969). A one-dimensional concept of secularisation has therefore become less useful for an understanding of the socio-cultural context of religious education.

The secularisation paradigm was also challenged when more immigrants came to European countries from the 1960s onwards, carrying with them their religious traditions. Countries like Canada, Australia and United States, with another history and scale of immigration, experienced similar challenges. This contributed to a visible plurality in the streets, which mirrored the increasing cultural plurality of late modern societies often called 'youth cultures'. The plurality contributed to a new agenda in educational debate (Grant, 1992; Ouellet, 1988; Verma, 1989). In religious education also a new agenda appeared (Felderhof, 1985; Thompson, 1988). The focus turned towards the teaching of world religions, as in the phenomenological approach in England. Gradually approaches multiplied; and in the ensuing debate the issue of religious plurality has been central (Grimmitt, 2000; Jackson, 1982; 1997). The focus on religious diversity has become so strong that issues of secularity, and the situation of non-believers, are sometimes neglected (Rudge, 1998).

However, questions about balancing the influence of interest groups and stakeholders are only one of the many issues relating to plurality and pluralism that are discussed in religious education today. (Jackson, 2004; Ziebertz, 2003). In many ways 'pluralisation' has taken over the position that 'secularisation' used to have, namely that of expressing the main challenges of contemporary religious education. It is therefore important to reflect critically on the meaning and use of the concept.

Pluralism and Plurality

Sometimes 'pluralism' is used within the field of religious education to indicate both that there is a multitude of religions within a certain society and the concern to have an education 'for all'. We should, however, distinguish between the diversity of religions, life-stances and life-styles on the one hand, and the different attitudes towards this plurality on the other. I suggest using the word 'plurality' in cases where a description of diversity is intended, and the word 'pluralism' where the intention is to give a normative valuation of the plurality. Both the description and valuing of diversity are contested issues; and therefore it is useful to keep disagreement about description apart, at least to some extent, from disagreement about normative issues.

The relation between the perspectives of description and normativity can be compared with the drawing of the duck-rabbit. This famous philosophical animal can be viewed both as a duck and as a rabbit, but as only one at a time. The one aspect becomes background for the other and vice versa. In the same way different aspects of culture (like religion) can be seen alternatively from a universalistic (normative) or from a relativistic (descriptive) point of view by the same person. This idea of gestalt-shift corresponds to the capacity we have as human beings constantly to change our perspectives. One basic perspective-shift is when

we alternate between the role as ‘participator’ and as ‘observer’. The participatory perspective is normative and universalistic; the observational perspective is descriptive and relativistic (Skjervheim, 1976).

Taking the religious education teacher as an example, he or she should be able to present and describe different religions from a relativistic perspective in the classroom. When the same teacher comes home to his/her own children, he or she has to give some kind of (non)religious nurture. Nurture cannot be wholly relativistic or descriptive; it has also to be normative. This simple division of roles, as teacher and as parent, is, however, not a clear cut division between education and private life. Both roles, or perspectives, are integral parts of education itself.

Most religious educators today will probably agree that a strictly neutral, objective or descriptive religious education is impossible. Many would continue to say that it is not desirable even if it were possible. Current epistemology tends to see scientific knowledge as socially constructed and thus to some extent perspective-relative; educational theory emphasises that learning is a social process as well as a cognitive one. This means that what goes on in most religious education is best understood as being both normative and descriptive. The choice is not whether to be descriptive or to be normative; the real choice is whether to make this difference and tension explicit or not. It can therefore be argued that one of the main tasks of education is to make students increasingly able both to separate and to hold together the two: description and normativity. This also is relevant for our understanding of plurality and pluralism.

Pluralism as a Normative Position

While the concept of plurality is preferably to be used to indicate a state of affairs where there is some sort of multiplicity, ‘pluralism’ should be taken to indicate an evaluation of a particular kind of plurality that usually is considered positive. Pluralism can be found in several fields of inquiry and theoretical positions (McLennan, 1995). A systematisation with examples of such positions is listed below:

1. Philosophical pluralism
 - a) Ontological (James, 1977)
 - b) Methodological (Naess, 1972)
2. Ethical pluralism (Kekes, 1996)
3. Religious pluralism (Hick, 1985; 1989)
4. Political pluralism (Dahl, 1982; Ehrlich, 1982; Ehrlich & Wotton, 1980)
5. Cultural pluralism (Eriksen, 1994; 2002)

All these theoretical positions related to pluralism are in fact based on the (descriptive) recognition of plurality within their field of interest, and take this as a

basic, positive, starting point of reflection. This common feature means that there are in some cases direct links between the different types of pluralism. They also draw on quite different lines of thought, owing to their separate fields of interest as well as their different historical and intellectual backgrounds.

The fundamental opposition to the pluralistic point of view would be to see a certain plurality as non-existent, or in other words to reject plurality on the descriptive level. Without a real diversity of positions, there does not seem to be much argumentative strength in pluralism. A more common version of anti-pluralism is probably that of seeing plurality as a problem that should be solved by reducing it or transcending it, for instance by moving towards either dual oppositions or some kind of monism. Another view that opposes pluralism, and one often voiced in the debate about religions, is to argue that the plurality in question includes conflicting truth claims; and that the only solution is to choose one truth against the other possible alternatives.

In spite of the challenging and basic issues raised by different types of theoretical pluralism, the main focus in the following is on the question of plurality, taking into account these theoretical and normative positions. It is vital in the discussion of plurality to acknowledge that we cannot get completely rid of such basic attitudes even if the focus is on description.

Attitudes Towards Plurality

The descriptions of socio-cultural plurality are always in some way marked by certain attitudes towards plurality, even if they are not explicitly articulated as theories or positions. Such attitudes may be described by using a typology of three (Parekh, 1996):

1. Naturalistic attitudes
2. Rationalistic attitudes
3. Romantic attitudes

The naturalistic attitude perceives the socio-cultural diversity to be inevitable and therefore not something to be lamented. As different flowers grow out of different soil, so also different ways of living are the results of specific conditions, be they geographical, climatic, historical or other. Socio-cultural plurality is seen as a fact of life, and rather than trying to overcome it, we should acknowledge it. Plurality is a result of deep-going divisions between humans; it is not a matter of superficial differences that can be overcome. If cultures seem to overlap, this is so only on the surface level. Naturalism therefore may serve as a support for group identity within a multicultural society.

To some extent the naturalistic perspective depends on its ability to show how socio-cultural plurality stems from differences that go deep. It is consequently dependent on the elements that are thought to produce plurality. Historically it has served as a basis for segregation and assimilation as ways of coping with multicultural challenges; further, different types of racism have exploited the naturalistic

perspective. But naturalistic elements are also part of communitarian views that support the rights socio-cultural groups have to secure and develop their traditions.

The rationalistic position is based on the conviction that, despite the apparent existence of plurality, people are equipped with the same basic intellectual capacity and therefore there are possibilities of reaching a common understanding. Education is seen as an important instrument for spreading rational and critical thinking. The rationalistic attitude may be of the strong kind, maintaining that plurality should be met with an appeal to a common understanding on a more basic level.

Another kind of rationalism is weak, characterised by a more relaxed position towards plurality, and the readiness to enjoy the (superficial) benefits of plurality. The rationalism of this position is implicitly seen as the privilege of an intellectual elite. It may be called a post-modern rationalism, not insisting on immediate enlightenment, but rather waiting for the general development to move in the direction of rationalism. In the meantime, plurality is 'nice'. What connects the different rationalistic positions is an 'open' view of cultures, combined with a 'closed' view of the common human nature.

Finally, the romantic attitude starts from the assumption that human beings are more or less free, creative, persons, who have the capacity to perceive and think differently, who may have different aims in life and who try to find ways of reaching these aims. From this human creative potential a plurality of life-forms are produced and reproduced.

The romantic attitude may have similarities with the naturalistic in the sense that they both see differences as deep rather than superficial. But while naturalism has the tendency towards essentialism, the romantic view tends more towards constructivism. However, the romantic attitude also has something in common with the rationalistic attitude. They both claim that there is some kind of common human potential. In the case of rationalism this potential is mostly seen as being cognitive and allowing for a developmental process towards unity. The romantic attitude places much more emphasis on emotional or bodily experiences, and underlines the creative capacity of humans. This leads towards processes of diversification. The romantic attitude tends to adopt an 'open' view of human nature and an 'open' view of cultures. A strong version of the romantic attitude could take the form of postmodernism, while more weak versions would be critical of this 'anything goes' attitude, possibly balancing it with elements of rationalism.

I suggest that most pictures drawn of socio-cultural plurality are coloured by one of these attitudes. Descriptions of socio-cultural plurality are not merely a registration and documentation of the varieties at hand. They are also meant for a purpose. To understand plurality is a process of interpretation, and this includes both 'explanation' and 'understanding' as other hermeneutical processes do. Interpretation as a process reaches its goal in its application; or rather in the act where understanding becomes visible. Our reactions towards plurality often rest upon a 'tacit understanding' of plurality. By drawing attention to this tacit or implicit understanding, it may also be easier to deconstruct some of the rhetoric of certain situated discourses related to plurality.

Traditional Plurality

A descriptive perspective uses the term 'plurality' to indicate the existence of a variety of different religious groups and/or religious views in a specific context like contemporary Western society. The background and dynamics of this context are elaborated and discussed in a substantial literature and the necessity of understanding the issues of religious diversity as something separate from the debate on pluralism is recognised by several researchers (Beckford, 2003).

The context of religious plurality raises issues both of general interest and of specific concern for religious education such as the following:

- Questions of peaceful coexistence and mutual respect between different religious communities;
- Questions of power related to the situation of religious and ethnic communities; in particular majority/minority relations and issues of oppression and racism;
- Challenges arising from the fact that most religious communities have 'border-problems' with respect to secular culture and other faith-communities including loss of members, diffusion of 'alien' ideology, generation-gap.

However typical religious plurality may be of the present situation in modern Western societies, its features are not confined to them. The Christian religion originated in a period of considerable religious plurality. In a global perspective it could also be argued that religious plurality today is more visible in many third world countries than in the West. The manifestations of religious plurality can all be understood as part of a wider concept of 'traditional plurality'.

This concept reflects an 'old' experience on the collective or group level, in the sense that societies or states have long consisted of several groups with, for example, different ethnic background, traditions, customs, languages and religions. It is implicit in many debates about multicultural society. For Western Europeans, traditional plurality seems to present itself as a feature of modern societies resulting from immigration after the Second World War, particularly from the end of 1960s. Partly because of this new immigration, Europe has become more aware of its old traditional plurality, whether this was regional, ethnic, religious or even (in a few cases) due to the presence of indigenous peoples. From a global perspective traditional plurality is hardly a new experience; it is rather the normal situation almost everywhere. The term 'traditional' is not meant to indicate some kind of developmental stage, but to point towards the long history of plurality. Traditional plurality is constantly undergoing changes and is itself a complex issue to analyse and interpret (Baumann, 1999).

One of the ways traditional plurality may differ according to time and place has to do with the relative separation of cultural groups and their traditions. One ideal-type can be described as separate groups living close to each other, but still each with their own language, religion and values. This kind of 'parallel plurality' may be exemplified by peaceful periods in the Balkans. On the other end of a continuum we find a 'creole plurality' with more 'open' groups, allowing individuals to cross

over, change religion, speak each other's languages etc. (Eriksen, 1994). In both cases this is traditional plurality. Seen in a historical perspective the nation-state has had a profound impact on socio-cultural plurality especially by turning cultural groups into either a 'minority' or a 'majority' within the limited area of the state borders.

The same historical development leading to construction of the modern nation-state has also created a socio-cultural situation that goes beyond traditional plurality. This concept is therefore not sufficient in order to grasp the specific modern situation. For a fuller understanding of the present context, we may introduce the concept of 'modern plurality'.

Modern Plurality

Historically, the development of modern society is connected with the rise of the bourgeoisie as the dominant class. Ideas about equality, freedom and justice, once effective in providing security for the individual and creating the framework for free enterprise, have penetrated society. But these ideals tend to undermine the specific socio-economic formation of capitalism creating problems of legitimisation, in particular when compensation is not made for the destruction of humans and environment caused by the same social system. Jürgen Habermas (1987) has expressed this contradiction at a high level of abstraction as the separation of and conflict between two main types of rationality: that of the life-world and that of the system.

Modern society has also changed the role and function of religion, often described as secularisation and privatisation. In debates about secularisation, sociologists of religion often emphasise differentiation as a particularly important factor (Tschannen, 1991). Differentiation means that modernity breaks down traditional bases of authority, such as religious ones, and accelerates the rate of change in many areas of life (Beckford, 2003). Consequently modernity displays different rationalities to its inhabitants, and the legitimisation of normative behaviour becomes strongly dependent on the context (Berger, Berger, & Kellner, 1974).

Following this, many sociologists of religion have described the position of religion in the West in terms of increasing individualisation and privatisation. Some theories about religion therefore focus on the situation of the individual, and in particular on questions of identity. It is not seen to be enough to investigate organised religion manifesting itself in groups with a distinct theology and rituals. Nevertheless, there has been a return to the study of the collective dimension of religion more recently, looking into the socio-cultural context of both groups and individuals (Beckford, 2003).

One of the insights of social science going back to Max Weber, is the significance of competing and often contradictory rationalities in understanding the present human condition. Sectors of society have become relatively independent of each other: they are held together mainly by their particular contribution to the overall

functioning of economy, but also through having specific tasks. The different sectors or systems within society tend to develop their own spheres of value and rules of behaviour, and it is difficult to see an overarching meaning apart from the continuation of the system in itself.

The competing rationalities are not only seen as contradictions between agents on the societal level, such as structures, power concentrations, groups and systems. They also manifest themselves as contradictions within the individual, as inner representations in the form of ideas and emotions in each person. The life-world is not experienced as 'traditional' and unified. The individual life-world is instead pluralised, and identity has become a major and time-consuming project. In spite of its distinctive modern character this should not be seen as a wholly new experience. According to Clifford Geertz, people in traditional societies also shift between different perspectives such as the religious, scientific, aesthetic and common-sense (Geertz, 1973). A difference between male and female perspectives also seems to transcend historical periods and a gender-based perspective could be seen as one of several dimensions of individual identity.

In spite of these modifications it seems to be the case that people more than ever before are exposed to a plurality of ideas, values, ideals, models and alternative choices for action. This means that innumerable learning processes are occurring, most of them outside the institutions traditionally designed for education. The motivation to take part in such learning processes comes from the fact that our daily life depends upon the use of different and often contradictory rationalities, and on managing them as part of a reflexive and plural identity. The number of different relationships we take part in has increased, which in turn has multiplied both the number of perspectives and the speed of perspective-shifts. To be able to live with these rapid shifts, our self-consciousness is intensified. We are impelled to question our identity and self-understanding over and over again, and questions of plurality and identity, including the religious dimension, have been the focus of several disciplines for some years (Baumann, 1999; Gergen, 1991; Giddens, 1991; Kymlicka & Norman, 2000; Meijer, 1995; Schrag, 1997).

The socio-cultural plurality we see in present societies is partly a matter of traditional plurality and partly of modern plurality. Both dimensions are dynamic in the sense that they may be more or less pronounced or 'strong'. Concepts like 'post-modernity' or 'late modernity' are expressions of the 'strong' type. The socio-cultural plurality in a given society at a certain point may therefore be indicated as a position relative to other societies or to different historical situations (Skeie, 2002b).

Religious Education, Plurality and Pluralism

Religious education has increasingly taken on the challenge of including the context of modern and traditional plurality as well as pluralism in its theoretical reflections and its teaching approaches.

Religious Education and Plurality

The relation between traditional (or religious) plurality and modern plurality can be described like this: the context of today's religious plurality is modern plurality. Modern plurality encourages a religious plurality and at the same time it relativises the question of truth by endorsing all these faith-options. Conflict and dialogue between religions have become part of an inner conflict and dialogue within people. Peter Berger has used the metaphor of the commodity-market to describe the social relations between religious communities. He has also coined the term 'the heretical imperative' to indicate the drive towards constant reinterpretation of tradition (Berger, 1967; 1980). While Berger has been most interested in organised religion, his co-author of *The Social Construction of Reality* (1991), Thomas Luckmann, has directed his research towards 'invisible religion' (1967). Through his work, we may gain a better understanding of how many people today outside religious communities continue to find ultimate meaning in their lives probably relating more and more spontaneously and freely towards traditional religious conventions and concepts. James Beckford (2003) has provided an updated and critical view both on a 'social constructionist approach' and on issues relating to social theory and religion; he strikes a balance between the processes of pluralisation, secularisation and re-sacralisation.

These insights are important for religious education because they provide an adequate interpretation of the situation of children and students in society. They also enable it to position itself as a scientific discipline. The situation of the child in a plural society is interpreted in several ways, based on different types of educational theory. This in turn has consequences for educational practice.

Some educationalists will tend to see plurality mainly as a given part of the child's surroundings. The main question will then be how education chooses to expose the child to these. A traditional way of seeking the answer would be to ask educational psychology about plurality and child development. It is possible to interpret Fowler's (1981) theory of faith development as a stage theory for children growing up under the conditions of plurality. In correspondence with what Gergen (1991) has called the modernist tradition of the self, the ultimate stage of development is a strong individual following mature and integrated values. In this line of theorising, plurality is conceptualised as the historically given surroundings, and humans as potentially strong individuals finding their way in the jungle of information. For religious education, this could mean endorsing and encouraging a variety of religious stances; but in this perspective the main aim in fact is to help individuals develop their own particular faith, while having an informed knowledge about other religions and world views.

Another, but similar, view understands the 'jungle' of plurality as hostile surroundings and wishes that the child would stay in the 'village' as long as possible before entering the wilderness. A corresponding theory of religious education would suggest that religious education should do its utmost to protect children from the forces of plurality until they are strong enough to deal with plurality themselves.

Perhaps this could best be done within the religious community or in a faith-based school with strong confessional values.

Others again consider plurality to be more apparent than real, and argue that under the surface of different religions and rationalities human beings are much the same. In religious education, this would mean studying the different religious traditions in order to discover similarities in issues of belief or values. A less cognitive approach would focus on religious (or 'spiritual') experience and life-issues, and allow the students to discover that they have the same basic feelings, hopes and anxieties across their faith communities. The individual student may then develop a personal life-view, one not necessarily linked to any of the explicit traditions, but based on the student's personal choice.

All these views conceive of plurality as an external force and, in spite of their different strengths, they are unable to deal fully with the issues of 'modern plurality'. The question for education is not merely how to expose the child to a plurality 'outside' school or external to the individual. Plurality is both external and internal; and in addition both children and their surroundings are undergoing change. Education should try to unravel some of these complex relationships. It may be easier to do this if the identity of the child and the social context are seen as different parts of the same cultural process, or 'flow of meaning' (Hannertz, 1992). The aim of religious education, as of education itself, should be to make people become increasingly conscious participants in this process, strengthening the interplay between the 'text' and 'context' of religious education. There are good reasons to argue that this is not reached by one approach alone and that there should be some sort of methodological pluralism in religious education. It has been argued, both on the basis of historical development as well as on an issue of principle, that religious education today needs to be pluralistic in its approaches (Jackson, 2004; Osmer & Schweitzer, 2003)

Religious Education and Pluralism

Religious education has to grapple with the question of pluralism in the context of actual plurality on at least three different levels; the epistemological, the ethical and the educational. First, on the level of epistemology, religious education has to deal with the problems arising from conflicting religions and world-views. Similar debates are known from theology, dealing with relations between religions, and from philosophy, dealing with rationality and realism (Hamnett, 1990; Hollis & Lukes, 1982). These debates sometimes influence the theory of religious education (Cooling, 1994). The existence of distinctly different approaches to religious education even within one country, partly being in competition or conflict with each other, and partly complementing each other, may be seen as a sign of different epistemological positions (Jackson, 2004).

Secondly, pluralism is related to ethics since religious education includes visions of a good society composed of people belonging to different religions and value-systems. It is generally agreed that all groups have a basic right to bring up children

within the influence of their parents' beliefs and values. Pluralism in this sense is, however, often in danger of rhetorical misuse. Some fundamentalist groups do not hesitate to use the declared pluralism of democratic institutions, although their long term goal is to dismantle both pluralism and the plurality it is based on. It can also be used as an official political slogan to divert attention from the problems of racism and power in ethnic relations. My view is based on the normative assumption that it is of great value to a society marked by religious and modern plurality that inter-cultural and inter-religious communication is taking place within a pluralistic framework. Current reflection on the relationships between citizenship and religious education also supports this (Jackson, 2003).

This brings us to the third and more explicit educational dimension of pluralism. The most strategic place for such inter-religious communication to take place is in a common school system, in a common classroom. In Western societies, educational institutions have been seen to lose significance in the socialisation of children and youth, which is now not so much into the family, as into peer groups and the oral and visual media. Nevertheless, the educational system is the only institution of society that includes most of the population during a formative period of their lives. The organisation and content of religious education varies from country to country in a way that would be difficult to imagine with other subjects (Schreiner, 2001). This suggests that religious education is one of the most politically sensitive educational issues. Religious education is strongly influenced by the politics of religion and religious educators can play a role by providing and supporting scientifically based knowledge. This does not mean opting for one universal approach to religious education in a plural society, but having a pluralistic openness towards different perspectives. It also means that religious education theory should be situated, self-reflective and multidisciplinary in its perspectives, and be sensitive to its own context.

Rather than making educational institutions a refuge from cultural and religious differences, these institutions should intensify their work with traditional and modern plurality. This could increase children and young people's competence in moving between the different arenas and perspectives of religious and modern plurality. They are subjects in their own culture, representing and presenting traditions. They can be innovative actors in their own learning if they are allowed. Religious education has the possibility of going deeper into both the religious and the modern plurality of which these children and young people are part, and developing their abilities both as observers and participants learning about and learning from plurality. In order to succeed in this, continuous and critical debate is needed both within and across national borders.

PLURAL SELVES AND LIVING TRADITIONS: A HERMENEUTICAL VIEW ON IDENTITY AND DIVERSITY, TRADITION AND HISTORICITY

Wilna A. J. Meijer

Philosophy of Education, University of Groningen, Netherlands

Introduction

In the last decades of the twentieth century the issue of cultural and religious plurality was much considered and debated in West-European societies, both in a general context and with regard to the religious education of the schools of these societies in particular. In the 1970s a new pluralistic or 'multifaith' approach in both the practice of religious education and its theoretical underpinnings began in Britain (Cole, 1978; Cox, 1983; Hull, 1982; Jackson, 1982). By the turn of the millennium the religious education curricula of all West-European societies had in different ways come to reflect the increasing religious diversity of multi-cultural societies (cf. Heimbrock, 1998; Heimbrock, Scheilke & Schreiner, 2001: both with contributions from various West-European countries). In Britain, pluralistic religious education started in a phenomenological vein (Smart, 1968; Smart & Horder, 1975), and developed into a more hermeneutical approach (Jackson, 1997; 2004). In his paper at the fourteenth session of the International Seminar of Religious Education and Values in Philadelphia in 2004, John Hull stated that a hermeneutical approach to religious truth was shared by most contemporary pedagogies of religious education. On this view, truth is essentially unattainable for human beings, and 'the religious life is a quest for truth and not a confident possession of the entire truth' (Hull, 2004). According to a hermeneutical approach the art of asking questions is central to 'good religious education'. Religious education is essentially of a reflexive nature in its seeking to promote understanding of religion.

The new, pluralistic religious education fits the present world of rapid change and of inter-national, inter-ethnic, inter-cultural and inter-religious communication. Before multi-faith approaches were developed, there existed in matters of religious

education a self-evident and exclusive focus on the religion of the home background of the pupils. The religious upbringing at home was followed by a corresponding mono-religious religious instruction at school, which aimed at a deepening and consolidating of either the Jewish or Christian (perhaps rather either the Catholic or Protestant), and so on, faith of the student. As a rule, there was some introduction to 'world religions' in the later years of the secondary school education, but by then the students were supposed to be already well grounded and solidly rooted in the religion of their fathers and forefathers. The present pluralistic forms of religious education, however, have the knowledge and understanding of various religions as their central aim: knowledge and understanding of 'one's own' religion, but also (or maybe even above all) knowledge and understanding of the religions—and the non-religious world-views—of other persons, one's fellow-citizens in contemporary multi-cultural societies and in the world at large. This change of direction in religious education makes it necessary to re-think the concepts of identity and tradition, because in this present context it is problematical to envision religious identity and religious tradition as given, fixed and stable. A new understanding can be gained from the hermeneutical philosophy of Gadamer and Ricoeur. Ricoeur's 'hermeneutics of self' (Ricoeur, 1992) is part of his hermeneutics of historical consciousness. It connects identity to interpretation in the following way.

Instead of connecting identity to being and ever remaining the same, and so opposing it to change and development, the concept of identity is to be related to interpretation. For human beings, identity is not a matter of being, but rather a matter of reflectively answering the question 'Who are you?' in relation to the question 'Who am I?' Personal identity is one's own answer to that question. This quest for identity never comes to an end as long as one lives. One of the aims of education, then, could be formulated as the capacity to cope with that quest for identity. In this perspective, diversity and change no longer seem opposed to identity. They are rather the 'material' for a continuing process of redescribing the self, to use a term of the philosopher Rorty. In other words: the change and diversity that human beings are confronted with in their own lives demand an ongoing interpretation of their own lives and history. Dialogue or conversation could be presented as a metaphor for this historical and flexible type of personal identity, in contrast with a rigid identity dependent upon the exclusion of others which judges religious plurality negatively using metaphors such as mishmash (Hull, 1991). The flexible concept of identity is the only suitable one for the 'conversational' mode of religious education', as Jackson (1992, p. 100) described multi-faith religious education. Jackson developed a concept of 'interpretive religious education' in Britain (cf. Meijer, 2004). Rorty's philosophy is one of its cornerstones, and, as will be shown below, the ideas of Ricoeur and Rorty on identity are in harmony.

Whereas Ricoeur's 'hermeneutics of self' supplies us with a conceptual framework for an idea of identity that suits this 'conversational mode of religious education', Gadamer's hermeneutical philosophy will be drawn upon to supply a suitable concept of tradition and historical consciousness (Gadamer, 1989). Every individual human being is from birth enveloped by a particular tradition. In a

culturally and religiously pluralistic context, and in the 'conversational' type of religious education fitting that context, this tradition is one of the voices in the conversation. The voice of one's own tradition then needs to be reflected upon, instead of being taken for granted or even allowed to go unnoticed. Only then can tradition become truly historical and develop historically (Meijer, 2004; 2006).

To summarise, the present chapter will reconsider the concepts of identity and tradition with the intention of incorporating plurality and historicity within them. Whereas the development of pluralistic religious education has generally concentrated on the acquisition of knowledge and understanding of religions and world-views other than one's own, the hermeneutical perspective supplies an understanding of what may happen to one's own tradition and identity as a consequence of such a broadening of horizons.

Identity as Interpretation

In his book *Soi-même comme un autre* of 1990 (Oneself as another, 1992), Ricoeur developed a hermeneutics of self as a part of his hermeneutics of text (Ricoeur, 1981; 1988). In the third volume of *Time and narrative* he had already introduced the concept of narrative identity and in the more recent book of 1990 he developed in detail the hermeneutics of self. This hermeneutics holds aloof from a Cartesian elevation of the ego as well as from Nietzsche's dethronement of it. A Cartesian view supposes the subject to be identical to itself 'through the diversity of its different states' (Ricoeur, 1988, p. 246) because there is a constant substantial kernel, whereas according to a Nietzschean view such an essentially unchanging subject is no more than a substantialist illusion; in reality there exists no more than a multitude of emotions, desires and ideas. The problem of personal identity cannot be solved if we retain this contrast between an inherent identity on the one hand, and no identity at all on the other.

In order to develop a better concept of personal identity Ricoeur introduces a distinction between 'identité du même' (sameness; *mêmeté*) and 'identité du soi' (selfhood; *ipséité*). The problem of personal identity, then, is a problem of change, inherent in the notion of personal history. It is impossible to base one's identity of selfhood or personal identity on one's identity of sameness, for the latter simply is not permanent enough. The identity of sameness can diminish in the course of time or even disappear. Not only do people change in appearance (for example, they grow old, grey, fat), but they also change inwardly: they change their opinion, lose their youthfulness, come to develop new propensities and predilections and so on. The identity of sameness thus disappears, but it is not necessarily the case that the identity of selfhood has disappeared as well. The identity of self does not depend on a stable identity of sameness, either in appearance or in an inner, constant substantial kernel of the person underlying outward changes. It is not substance that calls identity into existence, but interpretation. This hermeneutical concept of narrative identity, then, is historical and dynamic. '[T]he narrative operation has developed an entirely original concept of dynamic identity which reconciles

the same categories that Locke took as contraries: identity and diversity' (Ricoeur, 1992, p. 143). Identity and diversity are no longer in sharp opposition.

By introducing a dialectic between sameness and selfhood Ricoeur succeeds in placing personal identity where it belongs, that is, in history—history in the double sense of what happened and of the story of what happened ('histoire means both 'story' and 'history'; Ricoeur, 1981, p. 30). Personal identity lies in the narrative mediation (Ricoeur, 1990) between the two types of identity which never totally coincide. One's biographical story restores unity by bringing coherence into the diversity, continuity into the changes of one's life, including the changes in oneself. Personal identity, therefore, is a history, an interpretation: 'self-understanding is an interpretation' (Ricoeur, 1992, p. 114). In other words, and with another quotation from Ricoeur: 'The self of self-knowledge is the fruit of an examined life' (Ricoeur, 1988, p. 247).

We may conclude that we do not have to choose between a fixed, permanently identical, unchanging kernel of identity and a disintegrating multitude of ever-changing ideas, feelings, inclinations (that is, no identity at all). Interpreting our personal history makes coherence and unity possible. The self and all the changes it has undergone in the past are united in the temporal dimension, in personal history and its interpretation.

Ricoeur refers to Freud who used to work with his patients at 'a coherent acceptable story, in which the analysand can recognise his or her self-constancy' (Ricoeur, 1988, p. 247). Rorty also refers to Freud when he develops the image of 'the self as a centreless web of beliefs and desires' (Rorty, 1991, p. 1). Rorty's understanding of the self is similar to Ricoeur's concept of personal identity. The web of beliefs and desires which make up the self has no centre, but neither is it disintegrating, for it is a 'web', that is, 'a coherent and plausible set of beliefs and desires' (Rorty, 1991, p. 147; *italics added*). The self is not an inner centre and it is not a substance; it is contingent (see the title of Rorty, 1989, and Rorty, 1991, p. 23 ff.). Self-knowledge, then, is not a matter of a search for a 'true centre' (Rorty, 1991, p. 148), but an interpretation of one's own development and history. It is, to quote Ryle, 'self-knowledge without privileged access' (Ryle, 1949, p. 160), for it is not a simple matter of introspection.

The interpretation of one's own life is at least as fallible and tentative as the interpretations of the history and lives of others. A definitive, complete, universally valid autobiography is impossible and therefore we must settle for incompleteness and openness. We must 'think of any human life as the always incomplete, yet sometimes heroic, reweaving of such a web' (Rorty, 1989, p. 43). Our self-image, our identity, is thoroughly historical. It changes. We change it. It is not one story only. It is not unambiguous, but plural.

Identity and the Aim of Education

If this is the character of personal identity, that is, an interpretation, historical, ever changing and plural, then it is difficult to regard achieving personal identity

as an aim of education. The educational aim should be formulated in terms of a capacity to interpret, rather than the establishment of identity as a particular outcome of that capacity. However, when aims of education are formulated in terms of identity, it is often not personal identity which is intended. An ethnic, cultural or religious identity—in short, a collective identity—comes into play as soon as the word ‘identity’ is introduced in this connection. Such aims enlist the educational process in the task of socialisation and enculturation. The intended outcome is that future adults will share in a certain collective identity. In that case, the dynamics and the interpretive character of personal identity are denied. Human development over time is denied, for the intention is to fix in advance what future adults shall be, believe, and value. This can hardly be a promising educational strategy in a world of rapid change and of cultural plurality on everyone’s doorstep. How will intercultural communication be possible if people are locked into different collective identities? Segregation and isolation then take the place of interaction.

If we want to embrace pluralism instead of apartheid we must promote widespread interaction instead of limiting it to interaction with only other members of one’s own social, cultural and religious groups. The heart of pluralism is interaction between people socialised in different ways, having different opinions and different interests (Crittenden, 1982; Meijer, 1999; Meijer, Benner, & Imelman, 1992; Procee, 1991). The possibility of this interaction-in-diversity comes with ‘reflexivity’, that is, the human possibility of reflecting on one’s own assumptions as well as on those of others. Humans can distance themselves from the positions they once took, they can change perspectives, take the role of the other; in short, they can learn and learn again. Actually, the assumption that humans can learn is one of the foundation concepts of educational theory and practice. The human being is an open being, a ‘homo interagens’ and not a ‘homo clausus’ (Procee, 1991, p. 104).

This human potential for reflection is more fundamental than identity, for identity-as-interpretation is the outcome of reflection. Personal identity, therefore, is necessarily tentative, to be reflected upon, reconsidered and revised again and again. Education should therefore not aim at identity-development or identity-formation, but at personhood (Imelman, 1974, 2000; Langford, 1968): at the capacity, in other words, for autonomous and responsible interpretation and agency, ‘the capacity to make informed choices’ (O’Hear, 1981). This concept of the person should not be regarded as some sort of self-sufficient Cartesian ego. On the contrary, persons realise the limits of their knowledge and understanding and their fallibility. They are therefore prepared to enter into communication and discussion seriously, with the expectation of learning from it; and, as a result, to come to judge and value and act in ways more apt, adequate and justifiable. Such persons are able and willing to reconsider and reflect.

The knowledge consistent with this concept of the person is sometimes divided into three domains: knowledge of the physical world, knowledge of the social world (which implies for example the concept of person) and knowledge of oneself. The distinction between the first two domains implies the well-known contrast between the sciences and the humanities. The last domain (knowledge of oneself) may,

perhaps, in principle be thought of as a sub domain of the humanities. Nevertheless, the three domains are reasonably distinct. In our context, this seems useful, for it gives us the opportunity to clarify the relation between Ricoeur's and Rorty's concept of personal identity on the one hand and the concept of person that we dwelt on a moment ago on the other hand. For the two certainly should not be amalgamated uncritically.

The relation between the two concepts gives us clarity about what distinguishes them. The person is the interpreter: personal identity is an interpretation. The person is the subject that interprets, the subject that holds the knowledge, that thinks, judges, justifies, values and acts – critically and reflectively. Personal identity is an interpretation – an interpretation in one of the three domains in which the person is interpreting. Personal identity is a self-image, one of the many interpretations that a person develops. Like any interpretation, this personal identity is not unchanging and universally valid. It is, like any interpretation, tentative and open to deliberation. Knowledge of oneself, one's past, one's present, one's possibilities and restrictions, is tentative in two respects. First, we accept the interpretation as tentatively valid—as we do (or ought to do, at least) with any interpretation. But, secondly, the interpreted object, that is, one's own life, goes on and can overthrow the interpretation almost immediately. This double tentativeness or double historicity is shared to some extent with the humanities. The interpretation is, as such, historical and therefore tentative and the object of the interpretation is historical, unstable and changing.

We might conclude that self-knowledge is essentially part of the domain of the humanities. It seems not unreasonable, though, to give it special attention. Perhaps we might think of it as a borderline case of the humanities—with a particular vulnerability to distortion. Self-knowledge is strikingly fallible, because the interest of the interpreting subject in this particular case, 'his or her own life', can easily be so strong that it distorts. It is in this case impossible to rule out the practical consequences of interpretations. In any interpretation of one's own life, past and present, anticipation and interpretation of the future, play a part. The interpretation may result in changing the situation of which it is an interpretation (self-defying prophecies); or it may, indeed, be the other way round: the interpretation may result in its own realisation (self-fulfilling prophecies). This brings us to the issue of the historicity and ambiguity of the humanities—with a special eye to the borderline case of personal identity.

Ambiguity and Historicity

The fallibility of our interpretations and knowledge is, in the case of self-knowledge, even greater than in other cases. Therefore, it might be wise, particularly regarding this knowledge, not to exclude alternative interpretations, but to test them out. A variety of perspectives can be taken on the history of one's life; a plurality of descriptions can be given of the same incidents and episodes.

I can tell the story of my life from different angles. I can write from the memory of my father who died when I was not even nine years old. Or I could focus on

the discovery of my interest in the philosophy of education during my first year at university, though I had intended to study curriculum theory. I might reconstruct my life in the light of the fact that I am female in gender, comparing myself with my mother and sisters and with my girl-friends or with famous feminists. The phase of my life in which awareness of human mortality became more than just a piece of descriptive knowledge and gained existential relevance, might also be a point of departure. And so on, and so on. The stories may vary considerably, although they are all about one object, my life. The same events may figure in various stories and get a different meaning and relevance from the varying contexts. Nevertheless each and every story can be true and convincing. We should not allow ourselves to be confined to the supposedly one true version of the story of our life—to one fixed identity only.

Rorty seems to underline Kundera's words, which he rephrases in the following way: 'What he finds most heroic is not the ability sternly to reject all descriptions save one, but rather the ability to move back and forth between them' (Rorty, 1991, p. 74). The tentativeness and fallibility of our interpretations demand tolerance of ambiguity from us, demand the courage to live with uncertainty and instability, with openness and plurality. Reflective, critical persons are capable of living with an open set of identities, with a plural self. They constantly reweave the web of their identity. 'Maturity will, according to this view, consist (...) in an ability to seek out new redescriptions of one's own past—an ability to take a nominalistic, ironic view of oneself' (Rorty, 1991, p. 152).

Irony is a keyword in Kundera's essay on the art of the novel (Kundera, 1986). Irony results from the awareness that it is impossible to settle the question of which interpretation is the right one. It deprives us of our certainties by relativising each and every interpretation. Novels confront us with the ambiguity of the human condition, that is, the fundamental insight that human beings are never what they think they are. Therefore their identity is elusive, even illusive. This is what Kundera means by the phrase of his famous book title: *The Unbearable Lightness of Being* (cf. Kundera, 1986, especially p. 27). Thus Kundera's essay on the art of the novel presents the same insight as the theories of Ricoeur and Rorty on identity. And it is similar to the existentialist theory of personality developed by the Dutch author Kouwer (1963; cf. Meijer, 1991). Kouwer's question is whether there is a true kernel of our personality hiding behind all our appearances. His answer is ruthless: our hidden truth is nothing. The identity of human beings is indeterminable. Neither they themselves nor others can fix it for once and for all. If one insists on finding a fundamental principle in human existence, then that could only be ambiguity. Doubt and uncertainty then prevail. In other words, there is only one certainty, namely the wisdom of uncertainty, to use Kundera's expression. The irony of the novel is in tune with that wisdom, for the novel is the imaginative room in which no one owns the truth and everyone has the right to be understood.

Rorty accepts Kundera's idea of irony. Because of the contingency and the plurality of self-descriptions, of identities, irony is certainly not out of place here. Irony relativises – it accepts the ambiguity and elusiveness of personal identity.

Irony seems to be the appropriate epistemic attitude, at least in the domains of the humanities and self-knowledge. Irony, or in other words, the wisdom of uncertainty.

However, the fact that there is no unambiguous truth to be achieved need not lead us to the conclusion that arbitrariness is all that remains. On the one hand, Rorty sometimes seems to suggest that the search for the one and only true self should be replaced by an ironic, playful and unhelpful variety of self-descriptions. On the other hand, his pragmatism comes to the fore when he says that we can establish the use and value of one description as compared to others, even though the quest for absolute truth has to be rejected. Self-knowledge is fallible like all knowledge, or even more so; but perhaps in this case awareness of fallibility is especially liberating. To reinforce this proposition we can at this point refer to Ricoeur's hermeneutics of historical consciousness (Ricoeur, 1988). This hermeneutics of historical consciousness can be construed as an elucidation of the nature of the humanities. It is certainly connected directly with Ricoeur's hermeneutics of self as discussed above. Self-knowledge, personal identity, by definition is a matter of historical consciousness: 'The question of identity [is] tied to that of temporality' (Ricoeur, 1992, p. 17).

The categories of 'experience' (of the past) and 'expectation' (of the future) and the dialectic between them are constitutive of the historical consciousness. There should be an adequate balance between the two. If that balance is disturbed, historical interpretations will suffer. The expectations should not be utopian, but they should be built on experience gained in the reality of the present and the past. In other words: expectations for the future should be realistic. This gives us an opportunity of judging the relative validity of various interpretations. The measure of expectation should be human. One should be able to act on it, to take practical steps towards its realisation; one should be able to take practical responsibility for it. Escapist and unrealistic dreams of the future are a-historical.

With respect to the experience of the past, it is also true that our interpretations should be liveable and practicable. We should not fix the past or record it, set it down, as over and finished. Time and again we can reopen the past by reinterpreting it. We may revise and revive the past and, in doing so, renew possibilities that seemed to have died out. Alternative interpretations of the past open up alternative perspectives on the future. One's own history too, one's identity, is open to more than one interpretation. Plurality and identity are not opposed: they go together in the plural self.

Tradition and Historical Consciousness

Thus far the activity of the interpreting subject in the continuing redescription of its personal identity has been the central theme of this chapter. The role of tradition has not been neglected, in so far as it was implied that it was among the 'materials' that individuals draw upon in weaving the webs of coherent stories of their life, and was thus one of the 'voices in an ongoing conversation'. One of the important insights of hermeneutics, however, concerns the characteristic going together of

activity and passivity of human beings in their relation to tradition. This ambiguous unity of passivity ('being moved') on the one hand, and of activity on the other, is characteristic for the act of reading (Meijer, 2002), but it applies to all other acts of interpretation and understanding as well. We now turn to Gadamer's hermeneutics for some further clarification. That will provide insights into ways traditions are developing and evolving historically—in and through the historical interpretations and actions of human beings over time—and how the vitality of traditions depends on such constant reinterpretation. It will also provide an indication of the difficulty human beings find in coming to realise what 'one's own' tradition is, and what its meaning and significance, its historical but possibly enduring value are, and so on. Such an arriving at the level of reflection and understanding vis-a-vis one's own tradition is of great educational value, in contrast to the naïve, uncritical embracing of tradition that is characteristic of preconceptions or pre-understanding (*Vorverständnis*), or indeed prejudice.

Human life is historical and finite. This essential historicity touches all of human existence—human knowledge and understanding share in that historicity and are always tentative and liable to change. Understanding and interpretation are essentially part of human existence (conceived of as *Dasein*: 'being there', being-in-the-world, a situated-ness that demands interpretation). The temporal structure of the human existence is 'geworfener Entwurf' (Gadamer, 1960, p. 268), in which the active and the passive side of the relation of the human being with tradition are united. On the one hand, *Dasein* or human existence is 'geworfen', that is, 'thrown' or 'thrown into': being part of something pre-existing right from the start of one's life. This is the passive aspect of belonging to traditions ('Zugehörigkeit zu Traditionen'). But on the other hand, human existence is a project or 'Entwurf', which refers to the active aspect of projecting future possibilities for one's life from tradition, in other words, originating from tradition. The tradition as handed down and received affects any ideal and desire as to what one could do and become. Tradition is simultaneously enabling and restricting. 'Everything that makes possible and limits *Dasein*'s projection ineluctably precedes it' (Gadamer, 1989, p. 264). This fundamental tenet of the historicity of human existence is made into a hermeneutical principle when Gadamer derives the hermeneutical circle, the circle of understanding, from it.

This amounts to his rehabilitation of prejudice, pre-conceptions or pre-understanding. On the one hand, Gadamer turns against the prejudice of the Enlightenment against prejudice. He judges the Enlightenment rejection of prejudice a disempowerment of tradition ('*Entmachtung der Überlieferung*', Gadamer, 1960, p. 275). As human beings necessarily live in and from tradition, its importance can hardly be overrated, according to Gadamer. The preconceptions of human beings are not their individually formed ideas or judgments; they rather constitute the historical reality of the human existence—the history or tradition of which the individual human beings are a part, in other words: their specific historical way of living and thinking. On the other hand, Gadamer also distances himself from Romanticism, that in its reaction to Enlightenment celebrates tradition but in doing

so retains the Enlightenment opposition of reason and tradition. Both adhere to the same dichotomy and from there have to misunderstand the historicity of human existence and understanding. Tradition is not something that we could romantically affirm and embrace (or, indeed, not affirm and embrace, but criticise and reject). Rather, human beings are embraced by tradition. They live in and from and through tradition. Tradition, preconceptions, are rehabilitated by Gadamer because of their constitutive role in human understanding. In the processes of interpretation and understanding, tradition is, however, constantly modified. Reason and tradition are intertwined instead of opposed.

In the process of interpretation, preconceptions that help understanding are sieved and sifted from preconceptions that hinder it. It is impossible to sort out productive from unproductive preconceptions before starting the process of interpretation itself. The preconceptions from tradition are at our back, in our eyes rather than in front of our eyes. Since we are in a particular tradition and that tradition is in us, we have an eye for some things and not for others, for some aspects of a particular matter more than for others. It is only in trying to understand something specific (a text, a happening, a historical incident, for example) that we may discover parts of our preconceptions as enhancing or as hindering our understanding of that something. Our preconceptions are not at our free command; our only chance to identify, and then maybe change or correct them, is indirectly, in catching their share in understanding or misunderstanding something.

In all understanding tradition plays its role: enabling and restricting at the same time. 'Understanding is, essentially, a historically effected [wirkungsgeschichtlicher] event' (Gadamer, 1989, p. 300): history 'works' ('wirkt'), history is effective, we are affected. To this concept of *Wirkungsgeschichte* (effective history) Gadamer adds the concept of *wirkungsgeschichtliches Bewußtsein* (the consciousness of effective history, or put simply: historical consciousness). As long as human beings are not aware of the role of tradition, their understanding is naïve. Everything is entirely and naïvely understood from what is familiar, so familiar and close that it itself goes unnoticed. If, however, there exists an awareness of tradition playing its constitutive role in understanding, that is, if there is historical consciousness, then it is possible to proceed more reflexively and critically in interpretation and understanding. Not that from then on one's preconceptions are at one's disposal and that one is completely translucent to oneself. Historical consciousness is rather an awareness in general that understanding necessarily feeds on preconceptions. If that awareness is kept awake, it has the effect of openness: the individual will raise questions for search and research rather than be content with purely traditional, preconceived, prefabricated answers. An open mind is a questioning mind.

[T]o question means to lay open, to place in the open. As against the fixity of opinions, questioning makes the object and all its possibilities fluid. A person skilled in the 'art' of questioning is a person who can prevent questions from being suppressed by the dominant opinion (Gadamer, 1989, p. 367).

What is important here is that it is due to historical consciousness that people can intend to be open to what threatens to escape their attention or what threatens to get distorted in their eyes. They can, that is, be open to the different, to the other, instead of clinging naïvely to the familiar. And it is only because of such historical consciousness that the tradition that one shares can be carried onwards in a reflective, critical and innovative way.

CRITICAL REALISM AS A TOOL FOR THE INTERPRETATION OF CULTURAL DIVERSITY IN LIBERAL RELIGIOUS EDUCATION

Andrew Wright

Senior Lecturer, Religious and Theological Education, London

Introduction

In traditional forms of ‘confessional’ religious education, concerned primarily to nurture children within a specific faith, religious culture could be interpreted from the perspective of the relatively monolithic culture of the host faith community. Thus, for example, traditional confessional religious education in England and Wales sought to nurture children in the Christian faith in a manner inclusive of the perspectives of a range of different Protestant churches. Despite significant denominational differences, locally Agreed Syllabuses were able to achieve a level of unanimity about the nature of Christianity and the way it should be taught in the classroom. With the advent of forms of liberal religious education operating in a multi-faith context and seeking to cultivate religious understanding in an open non-confessional manner, this consensus quickly fragmented. Liberal religious educators faced the daunting task of interpreting religion in a pluralistic context in which there was no shared understanding of the nature of religion. The plurality of contrasting and contradictory interpretations of religion—religious and secular, universal and tradition-specific—made the search for a mutually acceptable framework for religious education increasingly problematic. In this context the search for secure foundations for the theory and practice of religious education needs to give way to the looser notion of a set of provisional heuristic guidelines. This chapter sets out to identify the criteria that such guidelines will need to meet if they are to do justice to the integrity of the vast range of different interpretations of religion currently competing with one another. It proposes that the philosophy of critical realism offers religious educators the possibility of reaching agreement on just such a set of guidelines.

Criteria for an Interpretative Framework

In this opening section I suggest four criteria against which any interpretative framework for liberal religious education in a pluralistic society ought to be judged: a) freedom of belief; b) tolerance of the beliefs of others; c) reasoned debate; d) the pursuit of truth and truthfulness.

- a) The first criterion is that any framework should allow for the greatest possible *freedom of belief*. Given the diversity of assumptions, beliefs and commitments present within a plural society, it is appropriate that liberal religious education actively affirms the core value of maximum inclusivity. This principle should apply to all participants at all levels—pupils, parents, teachers, faith communities, government etc.—and hence requires the acceptance of a diversity of different worldviews, both religious and secular. This in turn will necessitate reference to: a) a variety of different conceptions of the nature, scope, source and accessibility of knowledge; b) a range of complementary academic disciplines, both those associated with the human sciences and those – primarily theological and philosophical in outlook – whose task it is to address ultimate meta-questions; c) a cluster of different linguistic traditions and means of expression. Of course, it will never be possible to be completely inclusive: there will always be those who, whether for religious or secular reasons, elect to opt out of the process. Despite this, the framework ought to strive to create the conditions in which as many as possible feel able to participate without the need to compromise their fundamental beliefs and practices. Similarly, there may be certain attitudes, such as a deeply rooted irrationality or aggressive a-morality, which educators consider too extreme to have a role to play in the educational process. Nevertheless, since such extremes are normally best challenged through direct critical engagement in the classroom, exclusions ought to be rare exceptions to the general rule of inclusivity.
- b) The second criterion is that any framework should allow for the greatest possible *tolerance of the beliefs of others*. At its most basic, this is simply an extension of the criterion of freedom of belief: tolerance is the duty that individuals and groups have to others, given the acknowledgment of their own freedom of belief. However, it is important not to devalue the nature of tolerance. In particular, it is not to be equated with the bracketing out of conflicting beliefs in an attempt to cultivate the pretence of mutual compatibility. At root, this latter strategy denies plurality by seeking to impose a naïve economy of sameness. At the heart of genuine tolerance is the notion of forbearance: of recognising and living alongside those whose beliefs are fundamentally incompatible with one's own. Such forbearance can be a virtue if offered in a spirit of honesty and humility, though it can cease to be so if given grudgingly and disrespectfully. As Levinas (1969; 1998) consistently argues, when faced with the gaze of the 'Other' we have a shared moral duty to acknowledge the differences that stand between us, rather than seek to dissolve them in an ultimately fraudulent economy of mutual identity.

Tolerance thus requires an open and honest recognition of difference, together with a willingness to engage in a spirit of respectful humility with the truth claims and life-styles of those with whom we fundamentally disagree. This requires us to be both open and committed to our own beliefs and willing to engage with the beliefs of others: finding points of accommodation whenever possible, but not hesitating to acknowledge tensions and even irreconcilable differences when they arise. Any other strategy is likely to cheapen pluralism by seeking prematurely to overcome it; a refusal to accept the 'dignity of difference' is potentially a deeply intolerant strategy (Sacks, 2003).

- c) The third criterion is that any framework should seek to maximise *reasoned debate* between adherents of differing beliefs systems and world-views. Though it might be tempting to limit our framework to the twin principles of freedom and tolerance, to do so would be to implement a strategy that opens the door to a range of undesirable consequences. In the first place, simply to acknowledge other persons' beliefs without having the courtesy to explore them in any depth can be deeply patronising; this suggests, further, that an individual's failure to defend their own deeply held commitments might imply a lack of personal integrity on their part. Second, if religious education is reduced to the singular task of nurturing the virtues of freedom and tolerance, then its own integrity as a subject discipline is likely to be seriously compromised: functioning as little more than a branch of moral education, it will struggle to fulfil its primary responsibility to cultivate knowledge and understanding of religion as a *sui generis* dimension of culture. Third, an exclusive focus on the virtues of freedom and tolerance is likely—albeit often by default—to lead directly to the interpretation of a deeply divided pluralistic culture in terms of a specific set of Liberal beliefs and assumptions. I am assuming, here, a distinction—which I have unpacked in greater detail elsewhere—between liberalism as an open heuristic tool for exploring cultural diversity, and Liberalism as a closed world-view that seeks, like many others, to attract converts into its fold (Wright 2001a, 2004). If the cultivation of freedom and tolerance becomes an end in itself, rather than a means to the greater end of engaging respectfully with the beliefs of others, then the result is likely to be a return to confessional religious education—specifically the non-negotiable confession of the truths of Liberalism.

Confessionalism as an all-embracing approach to religious education in the context of a genuinely pluralistic society has, quite rightly, been seen as an inappropriate exercise of power. The imposition of the truths of (say) Islam or Christianity in such a context is no more acceptable than the imposition of a Liberal world-view that—by virtue of its abdication of any responsibility to examine different religious and secular truth claims—advocates the implicit relativism of fundamental beliefs by treating them as little more than private, optional, and hence ultimately unimportant, life-style choices. As we shall see, the criterion of reasoned debate need not imply a commitment to a narrowly conceived rationalism or assume that reason constitutes the

only response to the challenges posed by cultural pluralism. Nevertheless, a reasoned exploration of the questions thrown up by religious pluralism is, on balance, a better option than either a) the authoritarian imposition of one particular set of answers, or b) the premature abdication of the pedagogical responsibility to engage with the various issues.

- d) The fourth criterion is that any framework should seek to cultivate the *pursuit of truth and truthful living*. Once the virtues of freedom and tolerance are firmly in place, and the value of reasoned debate acknowledged, the inevitable question arises: ‘Why bother?’ Any answer, I suggest, needs to be offered in the light of religious education’s primary subject matter: religion itself. It is perhaps not overly simplistic to suggest that, broadly speaking, religion fulfils two basic roles in society: to enable religious adherents to engage with ultimate reality and to enable them to live flourishing lives in harmony with others in the light of that reality. The first raises questions of ultimate truth, the second of truthful living. Once again, we need to be wary of an uncritical acceptance of the prevailing Liberal world-view on such matters. Generally speaking, Liberalism tends to be agnostic about questions of ultimate truth, whilst at the same time identifying a close link between truthful living and the cultivation of the virtue of freedom and tolerance (Williams, 2002). Crucially, the vast majority of religious traditions simply do not see things this way: most offer truth claims that invoke some form of transcendent reality and interpret human flourishing in terms of the nature and quality of our response to this ultimate reality. Even the most mystical of Sufi traditions within Islam recognises that the ultimate truth about reality is to be found in the mystery of Allah rather than in any Liberal-inspired epistemological agnosticism. Truthful living for Muslims requires submission to the will of Allah rather than the cultivation of the Liberal virtues of autonomy and tolerance. It is, of course, true that Allah requires his adherents to take responsibility for their lives and to show the same mercy and beneficence to others that he has shown them. However, the virtues of freedom and tolerance are neither the foundation nor the primary goals of Islam. Rather, the true foundation is Allah and the primary goal submission to his will: freedom and tolerance are goods that flow from the Muslim world-view, rather than abstract principles that form and ground it. In a plural society we are faced with a diversity of incompatible accounts—both religious and secular—of both the ultimate nature of reality and the nature, grounds and possibilities of human flourishing. If liberal religious education seeks to take pluralism seriously, then it has both a moral and intellectual obligation to pursue rigorously questions of truth and truthfulness.

The Poverty of Current Interpretative Frameworks

Before considering the potential contribution of critical realism to liberal religious education, we must first rule out a range of alternative interpretative frameworks. Our attention will focus on the English and Welsh context, not least because the

original aspirations of liberal religious education that emerged in the early 1970s were broadly similar to those envisaged in the criteria set out in the previous section. Its commitment to the principles of inclusivity and tolerance may be taken as read: it is immediately apparent in the relevant literature and I am unaware of any attempt to dispute it (Jackson, 2004). However, its commitment to the rational pursuit of religious truth is perhaps less familiar, and as such requires further attention. Ninian Smart (1968) was both a key instigator and a representative figure in the emergence of liberal religious education in Britain. As such, he had no hesitation in arguing that the subject ‘must transcend the informative...in the direction of initiation into understanding the meaning of, and into questions about the truth and worth of, religion’ (p. 105). This in turn required a multidisciplinary approach to the subject, one rich enough to encapsulate ‘a chain of logic from the empirical study of religion to the para-historical’ (p. 106). Though the cluster of disciplines operating under the umbrella subject area of religious studies naturally ‘emphasise the descriptive historical side of religion’, they also have a duty to ‘enter into dialogue with the para-historical claims of religious and anti-religious outlooks’ (p. 106). At the same time, the discipline of theology must not be reduced to a private affair conducted within the confines of faith communities, since there is an ‘inner logic that drives theology outwards’ (p. 90). As we shall see, this bold vision—of freedom and tolerance preparing the ground for a rational exploration of religious truth—has yet to be fully realised. In the rest of this section we will consider three different attempts to establish an overarching interpretative framework for liberal religious education: a) the social sciences; b) philosophy of religion and theology; c) the more general and broad-ranging Western ‘outlooks’ of Liberalism and post-modernity.

- a) Appeal to the various *disciplines of the social sciences* has proved to be by far the most common response to the search for an over-arching interpretative framework for the subject. Of these, the appeal to phenomenological description has been pre-eminent, to the extent that in the late 1970s liberal religious education for many practitioners simply *was* phenomenological religious education. Though the phenomenological approach certainly set out to be both inclusive and tolerant, the measure of its success has been the subject of considerable dispute (Barnes, 2001). Its tendency to view religion as a generic category and represent diverse religious traditions within a common structural framework certainly allowed for the inclusion of a significant *quantity* of different religious perspectives; however, in viewing distinctive traditions as similarly structured sub-sets of the common category ‘religion’, phenomenology struggled to do justice to the substantial qualitative differences between traditions. This meant that a rich notion of tolerance-as-forbearance was often lost, a situation not helped by the expectation that pupils should bracket out their prior beliefs when engaging with the phenomenon of religion (Sharpe, 1975). Further, though the two crucial tools of phenomenological analysis—neutral description and empathetic understanding—certainly encouraged the pursuit of factual knowledge and experiential sensibility, they

contributed little to the kind of conceptual and critical understanding required of any evaluation of the truth claims of the various traditions. Insofar as the question of religious truth remained a live option, the generic structuralism underlying the phenomenological method carried with it the strong implication that individual religious traditions constituted little more than relativistic culturally bound expressions of a common universal religious experience. There is, unfortunately, no space here to explore various alternatives to phenomenology and in particular the appeals to the disciplines of psychology and ethnography (Hay, 1985; Jackson, 1997). Despite their unique and invaluable contribution, when used in isolation from other disciplines they tend to be reductive and as such fail to do full justice to religious pluralism. At the heart of the problem is the fact that the various social sciences focus on religion primarily as a product of human culture, and seek to interpret religions against the background of the secular humanistic traditions of naturalism and romanticism (Wright, 1998). Though I would not go as far as those who claim that the social sciences are inherently atheistic, they certainly carry with them an undercurrent of agnosticism (Milbank, 1993). At heart, they offer a discourse about religion as a socio-cultural reality, rather than a conversation with the accounts of transcendent reality offered by adherents of specific religious traditions.

- b) Given the problems inherent in an exclusive reliance on the social sciences, many religious educators have sought to re-engage with the *disciplines of theology and philosophy of religion*. The work of Peter Vardy, for example, has led to something of a revolution in the practice of religious education in the upper end of secondary schools: the explicit teaching of the philosophy of religion has certainly offered pupils tools for the rational exploration of religious truth claims in a manner that the social sciences have been unable to provide (Vardy, 1999). Despite this, the philosophy of religion tends to explore general religious questions at the expense of any substantial engagement with the beliefs of specific religious traditions: thus the existence of 'God' as an abstract idea tends to be discussed, rather than—for example—the specific Trinitarian God of Christianity. Though some educationalists have advocated the exploration of tradition-specific theological truth claims in the classroom, this has not yet had any lasting effect across the subject as a whole (Hookway, 2002; 2004). In contrast, the universal theological model underlying the work of David Hay has been far more influential: explicitly realistic in his theological orientation, he argues that religious education should counter the prevailing secular suspicion of religion by stimulating the universal capacity for religious experience of the transcendent or divine (Hay, 1985). The key problem is that such a universal theology fails to take pluralism seriously. In assuming that all religious traditions are relatively true expressions of a universally accessible religious experience, Hay plays down the importance of the unique truth claims of specific traditions: Islam, for example, claims that knowledge of Allah comes through the revelation offered

to humanity in the Qur'an, rather than any universal experience of—or feeling for—transcendence (Wright, 1998). Though there is much promise in this turn to philosophy and theology, the various approaches have tended to be both fragmentary and generalised. If both the philosophy of religion and the various theological discourses offered by specific religious traditions are to play a role in liberal religious education, and if we are not to lose touch with the valuable insights provided by the social sciences, then it appears likely that our search for a viable interpretative framework must turn not to the discourse of a particular discipline, but rather to a broader discourse capable of organising a range of different disciplines in a coherent and pedagogically valuable manner.

- c) These considerations lead us directly to a consideration of the third of our candidates for an appropriate interpretative framework: that of more *broad-ranging Western 'outlooks'*. The first of these, and by far the most influential, is that of Liberalism itself. It is particularly significant in the present context, since the four criteria outlined in the previous section—freedom, tolerance, reason and the pursuit of truth—constitute the quintessential heart of the open heuristic liberal tradition. This should not come as any surprise: given that all religious education is necessarily contextualised, one would expect liberal religious education in Western democracies to be contextualised within the liberal tradition itself. Nevertheless it is vital to exercise a degree of caution at this stage in proceedings. Liberalism originated as a broad moral outlook in response to a cultural context marked by tensions between distinctive and potentially irreconcilable belief systems. By invoking the liberal principles of freedom and tolerance as a kind of 'interim ethic', the original liberal vision sought to establish a context in which conflicting parties could seek to resolve their differences on the basis of a rational pursuit of truth, rather than through any resort to violence (Wright 2001a; 2004). However, as the liberal tradition developed, so it gradually became reified into a closed Liberal world-view, in which the values of freedom and tolerance came to be seen as ends in themselves. Once personal freedom was established as the ultimate human good, the pursuit of truth on the basis of reasoned argument was increasingly seen as a fundamental threat to such freedom: knowledge was equated with power, and reason identified as a tool of repression (Gunton, 1995). That is to say, the ultimate destination of Liberalism, understood as a specific world-view, is post-modernity (Wright, 2004).

In the interests of both tolerance and truth, religious education needs to be open to the possibility that there may be some truth in the post-modern belief that we can and should exercise our freedom imaginatively to construct the world(s) we wish to inhabit (Erricker, 2001). This, however, is not the same as suggesting that post-modernity is capable of providing religious education with an interpretative framework capable of doing justice to pluralism. On the contrary, insofar as the specific understanding of the nature of knowledge, power and freedom advanced

by post-modernity constitutes a specific response to the challenge of pluralism, it is not well placed to facilitate a conversation between conflicting traditions, especially those which fundamentally oppose the specific position adopted by post-modernity (Wright, 2001b). Not to allow post-modern perspectives on religion a voice within liberal religious education would be distinctively illiberal; at the same time, to embrace post-modernity as an interpretative framework would simply signal a return to confessionalism: the one difference being that, where formally children were taught to worship the Christian God, now they would be encouraged to worship at the altar of the greatest of post-modern gods—absolute and unrestricted freedom.

The Contours of Critical Realism

Critical realism claims that there is a real world ‘out there’ which we can come to know. In doing so, it rejects the naïveté of assuming that knowledge is self-apparent and readily accessible: the complex nature of reality, coupled with the limitations of human knowledge, means that the unearthing of knowledge is necessarily a critical process. Nevertheless, it is possible to know reality as-it-is-in-itself—however partially and provisionally—and as such there is no need to resign ourselves to knowledge of merely the appearance of reality, or take the more radical anti-realistic step of proclaiming all knowledge to be an illusion. The label ‘critical realism’ tends to be used in two different, though complementary, ways in contemporary philosophy: first, to identify a general stream of thought that seeks to avoid the extremes of modern rationalism and post-modern irrationalism; second, to identify a specific school of philosophy associated with the work of Roy Bhaskar (Bhaskar, 1993; 1994; 1997; 1998; Collier, 1994; 2003; Wright, 2004). In the rest of this section we will have recourse to both the general and specific uses of the term.

The assumption that there is a real world ‘out there’, that exists regardless of whether we are aware of it or not, constitutes the core assumption of critical realism. As such it is committed to the standard common-sense understanding of truth that most of us use as a matter of course in our ordinary everyday lives: a true statement is one which correctly identifies the way things ‘actually are’ in the ‘real world’. Thus, it is ‘true’ that aspirin can help to relieve pain, that at the time of writing George Bush is the President of the United States of America, and that the vast majority of Muslims believe in the existence of God. In philosophical terms we are concerned with ‘alethic realism’, according to which ‘a statement (proposition, belief...) is true if and only if what the statement says to be the case actually is the case’ (Alston, 1996, p. 5). Thus, gold is malleable if, and only if, gold is malleable; God created the world *ex nihilo* if, and only if, God created the world *ex nihilo*.

Critical realism goes on to make a number of broad assumptions about reality. First, that reality is in some sense meaningful. Despite significant levels of contingency, there appear to be, at a deep level, certain structures, patterns and processes that order reality. If this were not so, then it would be impossible to carry out most ordinary everyday activities, or engage in informed conversations in fields such as science and morality. Second, reality embraces the realms of the material

and the mental: it is equally true that water is made up of H_2O and that the idea of democracy has currency in the modern world. Thus critical realism questions Descartes' dualistic distinction between the material and mental as two separate substances, a distinction that resulted in false attempts to demonstrate the priority of either the material (empiricism) or the mental (idealism). Third, many critical realists leave open the possibility of the existence of some transcendent reality—possibly divine—'above' or 'beyond' the immanent world of objects and ideas bound by time and space (Archer, Collier & Porpora, 2004). Fourth, it seems likely that some dimensions of reality are more fundamental, or ultimate, than others. Thus, if atheistic naturalism is right, and the world is simply the product of cause and effect in the material world, then the reality of the mental ideas generated by human beings are ultimately dependent on physical reality. Similarly, if God created the universe out of nothing, then the reality of both the material and mental realms is dependent on the ultimate reality of God. It is important to recognise that these assumptions are minimal: the belief that reality is meaningful, that it consists of the realms of the material, mental and possibly transcendent, and that some aspects may be more fundamental than others, leaves open the possibility of a whole range of different readings of the world, both religious and secular.

The fact that critical realism claims access to knowledge of the world, yet remains open to a range of different interpretations of reality, inevitably raises epistemological questions. Broadly speaking, knowledge of the world is arrived at by careful attention to, and analysis of, the available evidence. We have no access to clear and certain knowledge built on self-evident foundations; instead we gain knowledge by constructing models, theories and stories on the basis of experience, which we then test against experience in an ongoing process of experience-revision. Such experience is conceived holistically: it is not a matter of constructing complex ideas out of atomistic units of sense experience, but of engaging with traditions of meaning that have gradually developed in communities, often over an extended period of time. The key analogy is that of the development of an intricate web of rational beliefs about reality, rather than the construction of a chain of evidential truths that are only as strong as their weakest link (Quine & Ullian, 1978). This process parallels that of scientific investigation, though the interest of the critical realist extends far beyond an exclusive concern for the natural world, embracing fundamental questions of meaning, value, morality, aesthetics, spirituality and transcendence. Such knowledge is the subject of informed judgement rather than direct proof. As such, it is always contingent, but not for that reason arbitrary and relativistic: there are normally good reasons for preferring one set of judgements over another.

Since reality is conceived of as both structured and complex, it is possible to offer different-yet-complementary accounts of the same reality. Thus a person may be described both by both the natural sciences (physics, chemistry, biology etc.) and the human sciences (history, psychology, sociology etc.). Our knowledge can be extended further by attending to artistic disciplines: a poem or painting may illuminate the nature of a person in a manner the natural and social sciences are

unable to achieve. In addition the meta-disciplines of philosophy and theology can help us to understand people in terms of their relationship with the ultimate structures of reality. Critical realism resists the reductionism inherent on both the modernist tendency to reduce knowledge to brute material facts, and the post-modern inclination to limit 'knowledge' to the mere expression of subjective taste. By refusing to rule out in advance any single discipline's contribution to our knowledge of the world, critical realism argues that it is possible to build up a rich multi-dimensional understanding of reality.

As individuals and communities involved in the pursuit of knowledge of reality, we are intimately engaged in the world we seek to understand. As such we are ourselves part of reality, though only ever a relatively insignificant part: if we were to cease to exist, the change this would bring about in the actual order-of-things would be slight. The implications of this are two-fold: first, it remains legitimate to talk realistically of a given world 'out-there' whose structures endure whether we know about them or not; second, it is equally legitimate to talk about our participation in reality. It follows that our knowledge of the world takes the form of relational knowledge of a reality that we can know in part, but not fully. This is important, since if our knowledge of the world includes knowledge of how we relate to the world it follows that the pursuit of knowledge is both the search for truth about the world and the struggle to find ways of living truthful lives in harmony with the nature of reality in general, and with ultimate reality in particular.

Critical Realism as an Interpretative Framework for Religious Education

My suggestion here is that critical realism offers religious education the basis for a broad interpretative framework that meets the four criteria outlined above. This is not to claim that it constitutes the only possible framework, though I am suggesting that at the present moment in the development of liberal religious education it is on balance probably the best currently available to us. The remainder of this chapter will seek to defend this claim.

- a) The first criterion – that any framework should allow for the greatest possible freedom of belief – seeks to be as inclusive as possible with regard to a wide variety of different religious and secular beliefs. Given critical realism's commitment to the realistic pursuit of truth, it would appear likely that this criterion will be met if the proposed framework is able to accommodate the views of those anti-realists who find no value whatsoever in the pursuit of truth. As we have seen, critical realism posits an ordered and meaningful reality made up of the realms of the material, mental and possibly transcendent. Broadly speaking, anti-realism takes a number of different forms: strict metaphysical anti-realists deny that there is such a thing as 'reality'; hard versions of idealistic anti-realism reject the existence of

material reality, while softer versions argue for the priority of the mental over the material; epistemological anti-realists deny that we can establish any substantial knowledge of reality (Wright, 2004). My contention here is that in affirming any of these options, or other similar ones, anti-realists are actually saying something positive about the order-of-things, even if this is little more than to affirm the priority of chaos, meaninglessness, or human ignorance. Thus, for example, Richard Rorty makes it plain that, in his view, the network of cause and effect in the natural world is of no deep interest to humanity, that the traditional pursuit of truth and meaning is at root a pointless activity, and that consequently we should focus our efforts on seeking to achieve a liberal utopia by constructing aesthetically satisfying cultural environments in which to live out our lives (Rorty, 1989). Though he would reject the terminology, he is in effect claiming that this is actually how things are ‘in reality’, and in doing so offers a clear understanding of both the ‘true’ nature of reality and the kind of ‘truthful’ behaviour human beings ought to engage in. Because critical realism’s commitment to realism is minimal in its positive assertions, it appears to be robust enough to embrace even those who wish to deny the reality-of-reality-itself. It is of course true that, in starting out from the question of reality, critical realism prioritises a particular set of concerns and as such is not neutral; nevertheless its capacity for inclusivity is noteworthy. Given this fact, the onus would appear to be on those opposed to the proposed framework to come up with a more inclusive one.

- b) The second criterion—that any framework should allow for the greatest possible tolerance of the beliefs of others—requires an open and respectful recognition of difference. In this context, critical realism offers hospitality to a wide range of diametrically opposed viewpoints, including that of secular Liberals deeply suspicious of the value of religious education. As represented by John White, secular Liberals are committed to upholding the ‘freedom of individuals to lead lives of their own’ (Callan & White, 2003, p. 96). There are, of course, those in society who reject this Liberal vision: for instance, religious believers who ‘locate personal well-being in strict obedience to God’ (p. 99). The tensions between religion and secularism reflect the reality of ‘rival understandings of what makes human lives and the societies in which they unfold both good and just’ (p. 96). In this context the pursuit of freedom requires us to bring our ‘basic assumption and conceptual schemes to the bar of critical scrutiny’ (p. 95). When this is done, according to the secular Liberal, religious belief is shown to be based on an inadequate metaphysic that cannot be defended rationally. However, in response, religious believers reject this conclusion by setting out the case for the rationality of religion (Mitchell, 1973; Swinburne, 1981; 1993; 2004). Hence we arrive at a situation which the rival truth claims of secularists and religious adherents are the subject of ongoing debate: if this were not so, evangelical atheists such as Richard Dawkins (1990) would not devote so much time and effort to defending their beliefs. My contention is that the vigour of such debates is a mark of

a healthy pluralistic society, and that the critical framework I am espousing provides a forum within which they can continue. Given the fact that the dispute has yet to be resolved to the satisfaction of both parties, should either elect to withdraw in the belief that their case has been proven, they would be acting in a fundamentally intolerant manner. Hence the framework appears to be robust enough to allow for tolerant debate between the extremes of committed religious belief and staunch atheism, and—by implication—many different shades of opinion in-between. Whether all parties elect to engage in the process is a pragmatic issue: my claim here is simply that if the framework of critical realism were adopted then there would be nothing in principle to stop them doing so.

- c) The third criterion—that any framework should seek to maximise reasoned debate between differing belief systems and world-views—assumes a critical approach to education. In the present context the term ‘critical’ is not intended to carry connotations of either thoroughgoing scepticism or a narrowly defined rationalism (Bailin & Siegel, 2003). The kind of critical thinking entailed in the reasoned debate advocated here appeals as a rich notion of reason that combines thought, feeling, reflection and action. In doing so it strives to be open to different conceptions of the nature of reason, as well as to different ways of approaching, understanding and interpreting religion. If, for example, a religious adherent were to claim that the only way to engage genuinely with their beliefs is through feeling, imagination, empathy and spiritual sensibility, then there is no reason why such a view should not be considered alongside more rationalistic or reflective approaches. Critical realism does not require teachers to choose between the two before planning a series of lessons; rather, it anticipates that the question of how best to interpret religion is one with which pupils will grapple with for themselves. The most natural starting point for the formal exploration of religion is that of the various relevant academic disciplines: phenomenology, history, sociology, psychology, anthropology, ethnography, philosophy and theology. Liberal religious education has often been limited by its dependence on either a single discipline, or a narrow cluster of related disciplines. Such self-imposed restrictions avoid a key insight of critical realism, namely that the world is a complex reality that is more likely to reveal its secrets when approached from a number of complementary perspectives. We have already had cause to note the way in which, under the influence of Peter Vardy, religious education at the upper end of secondary schools in Britain has been significantly enhanced by adding the discipline of the philosophy of religion to the standard approach of phenomenological and ethnographic description. The implication is that there is a case for expanding further the range of academic disciplines drawn on by religious educators, as well as for extending their use into the lower secondary and primary levels of schooling. A key virtue of the critical framework proposed here is that it is intentionally open to a range of different academic disciplines.

- d) The fourth criterion—that any framework should seek to cultivate the pursuit of truth and truthful living—is concerned to direct the aims of liberal religious education. One of the key concerns of liberal religious education is to enable citizens to live rich and fulfilled lives. One of the prerequisites of this is that individuals should take responsibility for their beliefs and actions. It is tempting here to equate personal responsibility with autonomy, and from there simply to identify the good life with the exercise of unconstrained freedom. The problem with this, of course, is that all too often our autonomous choices are misdirected and ill-informed. To live a debauched life driven by the desire to consume for the sake of consumption—through, for example, a glut of sex, drugs and shopping—will simply make us slaves to our senses and to the economic structures of consumer-lead capitalism. If we wish our children to live rich and fulfilled lives we must help them to make responsible choices. According to critical realism, such choices are dependent upon a willingness and ability to wrestle with questions about the actual nature of reality. We can, I think, make the point a little stronger: because our children are infinitely valuable, we should teach them to make not just responsible choices but excellent ones. It is at this point that the search for truth and struggle for truthful living coincide: if a choice is to be genuinely excellent, then it ought to be in harmony with the ultimate order-of-things. Of course, whether one believes in God or not, it is always better to be a good person than a bad one. However, if God does exist it is a far better thing to be a good theist than a good atheist; similarly, if God does not exist it is a far better thing to be a good atheist than a good theist. It follows that if, as teachers, we are serious about wanting the very best for our pupils, then we ought to offer them an education that will allow them to pursue truth and strive for truthful living in an informed and reflective manner. Insofar as the core task of religious education is not merely to supplement programmes of social, personal and moral education, but rather to treat the integrity of its subject matter just as seriously as other subject disciplines treat their own, then the primary task of religious education ought to be that of pursuing ultimate truth and truthfulness in the light of a variety of religious belief systems and their secular counterparts. My suggestion is that the framework of an open, sensitive and critical religious education proposed here is more likely to enhance the pursuit of religious truth and truthful living than any other currently available, and as such ought to be given serious consideration, at least until such time as a better framework comes along.

Conclusion

I have argued that in a pluralistic cultural context it is highly unlikely that final agreement will ever be reached on the nature, function and truth of religion and religions. Faced with this situation religious educators cannot hope to ground their subject discipline on any such agreement. The most appropriate way forward is

to look for a loose set of procedural principles that can help facilitate debate between contrasting and contradicting points of view. Such principles will need to maximise freedom of belief, show forbearance towards the beliefs of others, encourage reasoned debate, and focus on issues of ultimate truth and the challenge of living good lives in the light of the ultimate order-of-things. Critical realism offers a philosophical framework compatible with these four heuristic principles. As such it offers a shared starting point for debates surrounding the theory and practice of religious education amongst individuals and groups whose understanding of both truth and truthfulness are deeply incompatible. One last point: the proposed principles and framework are not intended as foundational for religious education, merely as the best working framework currently available to us. As such it will be of value only until such time as a better framework is proposed.

THE FUTURE OF RELIGIOUS EDUCATION IN THE CONTEXT OF POSTMODERNITY

Philip Hughes

Research Fellow, Edith Cowan University, Australia

Introduction

Since the beginning of European settlement, most Australians have identified with one of the Christian denominations, although not all have been rigorous in their practice of faith. Some have been enthusiastic about their faith, while others have been lukewarm, and some have felt excluded from its social expressions and its benefits. Most Australians have, at some time in their lives, participated in religious education that has been offered through Sunday school or day school.

Patterns are changing, however. The Australian Community Survey, a survey of 8500 Australian adults randomly selected from electoral rolls in 1998, found that of those people 60 years of age and older, 85 per cent had attended a church or Sunday school as a child. Among Australians in their twenties, just 59 per cent had had such involvement. If these trends continue, the next ten-year age group of Australian children may be the first in which the majority have no memory of involvement in a religious organisation (Bellamy, Black, Castle, Hughes, & Kaldor, 2002).

One reason for the change is the antipathy, and occasionally hostility, towards such education among young people and their parents. Where religious education is occurring, many young people feel negatively towards it. These attitudes and the apparent lack of impact of religious education on the public practice of faith provide good reasons for re-thinking religious education. The first section of this chapter will outline evidence for these attitudes to religious education. The second section will suggest explanations for these attitudes in terms of changes in the nature of religion. The third section will suggest that alternative forms of religious education under the term of 'spiritual literacy' are appropriate, given the changes in the nature of religion. This chapter is based on data gathered in Australia, although the findings reflect general trends found in some other parts of the Western world.

Attitudes to RE

While Catholics have provided religious education through their school system, Protestants have concentrated on Sunday Schools. Yet, in many Australian Protestant churches, Sunday Schools have disappeared. The National Church Life Survey found that 28 per cent of Protestant churches in Australia had no Sunday school or other regular children's activities in 2001 (S. Sterland, personal communication, December 24, 2004). While some churches operate children's clubs and other churches run 'children's church', the educational task of passing on the details of the faith to children is done less systematically or comprehensively than it was in the Sunday Schools. Indeed, many of these children's activities have little educational significance. Churches are finding it difficult to create the occasion for passing on the details of the traditions of faith in a sustained way.

In most States in Australia, government schools have the legal responsibility to provide the opportunity for accredited lay people or clergy from local churches, if available, to provide religious education. No national data are available on how many children receive such religious education, but in the State of Victoria, for example, 49 per cent all government primary school students received some religious education in 2004 (Council for Christian Education in Schools, 2004). At secondary level, there are few classes in religious education in government schools, although some schools, in conjunction with local churches and communities, employ chaplains to provide some spiritual input and contribute to counselling.

Parents have the legal right to withdraw children from classes in religious education in government schools. Few do so, but parents are hesitant about the value of such classes (Hughes, 1998). The Australian Community Survey (1998) found that a little more than half (56%) of the sample of Australian adults thought that religious education in government schools made a worthwhile contribution to children's education. Many were neutral or unsure, and a significant minority (19%) thought that it did not contribute.

Close to one third (31.6% in 2002) of all primary and secondary school students in Australia attend a church-run school (Australian Bureau of Statistics, 2004). The church-run schools are continuing to increase their share of the educational market. Most of these schools have programs of religious education for all year levels.

One of the least affirmed functions of the churches in Australia is the provision of education, despite the fact that so many students attend a church-run school. Most people are very happy for the churches to provide welfare for the poor, run social activities, develop counselling services and establish accommodation for the homeless. However, Australians are divided about the churches' involvement in general education, partly because of the opportunities this provides the churches for religious education, or, as some would see it, indoctrination. Fifteen per cent of the sample of Australians in the Australian Community Survey (1998) said that churches should NOT provide schools, and another 29 per cent said that it was not important for churches to provide schools. On the other hand, 25 per cent think that providing schools is very important or even the most important contribution the churches make to society.

Most parents of children who go to church-run schools (69% according to the Australian Community Survey) are not active in any religious denomination. More than 70 per cent of parents who chose church-run schools for their children did so on the grounds of the quality of teaching, the standards of school discipline, the climate of care and the values upheld by the school. The Australian Community Survey indicated that only 29 per cent of these parents considered the 'spiritual emphases' of these schools very important in their decision.

Those people who value religion, do so mostly because they see it as promoting moral values, and, in particular, the values of care and compassion. When asked in the Australian Community Survey (1998) why religion was important to them (and 72 per cent of the population said it was important), 55 per cent of the population indicated it was important for giving them values to live by. Most people who see religious education as contributing to students' development, see its value in contributing to commitment to basic ethical values.

A survey of principals and chaplains in schools of the Uniting Church in Australia, conducted in 2002, echoed that hope. Most principals saw religious education as an important part of the school curriculum and perceived it as contributing to moral education. It would help prepare students for adult responsibilities within the context of family, community and nation (Hughes & Bond, 2001).

In 2004, about one hundred and fifty in-depth interviews on religion and spirituality were conducted by the Christian Research Association among students in twelve church-run schools, some Protestant and some Catholic, and three government schools, in three Australian states, as part of a study of youth spirituality (Hughes, 2004c). Some students, including several recent immigrants, were strongly committed to a religious faith and were involved in its practice (Hughes, 2004b). While the study did not attempt to evaluate particular programs of religious education, it found that among those who had a religious commitment more than half were sceptical of the value of religious education. For example, several students expressed the feeling that neither the discussion of ethical and social questions nor the study of the Bible and history of the church related to the personal faith, the inner relationship with God that was central to their experience and understanding of faith. Religious education should be making other students Christian; otherwise there was little point in it, said one student.

Many other students interviewed had little interest in organised religion. Some of these students enjoyed the discussions about social and personal issues that occurred in religious education and felt it was good to learn about other religions. But most felt religious education was peripheral to their lives. At best, it was something that stimulated their curiosity. At worst, it was boring and off-putting. It was not going to help them in their major goals of entering tertiary education, finding a job or exploring ways to enjoy life (Hughes, 2004c).

Other studies have reported similar findings. Flynn and Mok, for example, reported that just 19 per cent of Catholic year 12 students reported that religious education classes were taken seriously by the students, and just 35 per cent said that religious education classes were related to real life and to their own needs (Flynn &

Mok, 2002). A Catholic educator, Graham Rossiter, commented that these findings 'warrant a 'wake-up' call for Catholic school religious education—but not panic' (Rossiter, 2002, p. 54).

Changes in the Nature of Religion

The fact that fewer parents are sending their children to Sunday school and are showing little support for church-based religious education in schools has been interpreted as the result of the secularisation of Australian society (for example, Wilson (1983) and McAllister (1988)). Most of these commentators have seen this process as similar to that described in other parts of the Western world as a consequence of modernisation and the replacement of religious ideas with scientific and technological ones. The picture that the American sociologist, Peter Berger, drew of a long-term process of secularisation in which modernisation necessarily led to 'a decline of religion, both in society and in the minds of individuals' (P. L. Berger, 1999, p. 2) has been widely accepted.

Yet, as the twentieth century neared its close, the mood changed. Berger himself changed his mind. While modernisation had had some secularising effects, he said, it had also provoked powerful movements of counter-secularisation. Globally, there has been a resurgence of Pentecostal and evangelical Christians as well as substantial growth in many other conservative religious communities (P. L. Berger, 1999).

Many other sociologists have questioned the secularisation thesis. Rodney Stark and Roger Finke (2000), for example, point to the continuity, even resurgence, of faith, and the fact that faith is found among scientists, who, the thesis would predict, would be most likely to be secular. They also note that there has never been a 'Golden Age' when everyone was highly religious. Other sociologists have argued that contemporary evidence did not fit any of the many versions of the secularisation theory (Lyon, 2000).

Some scholars, such as Steve Bruce (1999), have continued to argue that secularisation is occurring. He suggests that the processes of differentiation, societalisation, rationalisation, and cultural diversity generate secularisation except where religion finds or retains work to do other than relating individuals to the supernatural.

Australian surveys show that, while some sectors of the church are declining, other parts are very much alive and growing (Kaldor, Bellamy, Powell, Castle & Hughes, 1999). Pentecostal and some evangelical denominations have seen continued growth, while most of the decline has occurred in the more liberal sections of the mainstream denominations. There has been some growth in other religions such as Buddhism, Hinduism and Islam, largely through immigration.

Between 1996 and 2001 the proportion of the population attending a church on a typical Sunday fell from 9.9 per cent to 8.8 per cent continuing a slow but steady decline which began in the 1960s (Bellamy & Powell, 2004). At the same time, there has been a persistence of religious symbols and language. A comparison of six national surveys that have been conducted in Australia between 1969 and 1998

showed that while there was some evidence for a decline in the proportion of the population believing in God, the proportion affirming belief in heaven, life after death, the devil, and hell did not show any clear trends. The evidence suggested there had been an increase in belief in the soul (Hughes, 2001).

Rather than simply disappearing, religion is changing in form. The persistence of religious beliefs, despite decline in organised religion, suggests that the dominant trend is not secularisation but an individualisation of religion. Religion is being seen as something individuals pursue rather than the responsibility of organisations. In so doing, individuals decide for themselves whether they will use the resources offered by religious organisations. I use the term 'spirituality' rather than 'religion' to refer to beliefs and practices related to concepts that transcend the material world but are understood as pertaining to individuals rather than communities and seen as the responsibility of individuals rather than organisations. Hence, the change in form can be expressed in terms of a movement from religion to spirituality. As something constructed by individuals rather than organisations, spirituality takes a great variety of shapes and forms in contemporary Australia (Tacey, 2000).

Preliminary findings of more than 140 interviews with secondary school students on religion and spirituality of Australian young people echoed these trends. Most students interviewed in church-run schools said that they thought people had a spiritual dimension, although they gave a variety of accounts of what this dimension might be (Hughes, 2004c). Almost every student expressed the opinion that they could and would decide for themselves what to believe and practice. The spiritual dimension was seen as personal rather than rooted in their participation in the wider society or in religious communities.

These changes from 'religion' to 'spirituality' may be understood in the context of more general changes occurring in Western culture. From an anthropological perspective, culture is the way of life of a people. It is the habits, the patterns of life that communities or societies adopt (Geertz, 1975). Culture has always been somewhat open-textured, offering people within its patterns, a variety of options. It has always had a dynamic nature, constantly undergoing change. However, in the 1960s and 1970s, there was a dramatic increase in the dynamism and open-weave of culture. Indeed, such was the extent of change that, in many aspects of life, the traditions and habits of past generations were left behind. Rather than one or a few sets of new patterns emerging, it seemed each individual was developing his or her own cultural patterns.

There were many influences that converged at this momentous period in Western history. Among them were increased globalisation and cultural pluralism in the Western world, of which religious pluralism was one part (see, for example, Kurtz, 1995). In concrete terms, increased world travel brought people in touch with many ideas and cultures, as did the mass media.

With new, effective methods of birth control, spiralling costs of bringing up children in the Western world, and new confidence that the great majority of children would live to maturity, family sizes contracted in the 1960s (P. L. Berger,

B. Berger, & Kellner, 1974). Within smaller families, parents sought to meet the needs and interests of each child rather than expect their children to fit in with the needs of the family as a whole. Hence, the focus of life became the individual, rather than a social unit.

From the perspective of their personal needs and interests, and aware of the range of possibilities, young people began constructing life as a series of scenarios, as evolving biographies, rather than as copies of previous generations. This process has been described by one social theorist as seeing the self as a reflexive project (Giddens, 1991). Life was open. From the simple things such as the patterns of eating to the basic structures of family life and the relationships between males and females, every aspect of life was seen as negotiable.

Religion had provided, in each culture, basic frameworks for how people saw the world. Through those frameworks, the structures of life and society had been justified and their rules given prescriptive force. While science had increasingly taken the primary role in Europe in providing details of the framework since the Renaissance, the idea that God had created the universe and human society and had ordained both the laws of nature and the moral rules for society persisted among the majority of European populations and their diasporas until the 1960s.

Within the changed nature of culture, the very idea of there being one basic framework for seeing the world became untenable for many people (Bruce, 1999). The awareness of the plurality of cultures meant an awareness of the many frameworks for seeing the world and the many ways of justifying the structures of life and society. There was no need to adopt one worldview to the exclusion of all others. If an individual chose a particular worldview or set of cultural patterns, it was on the basis of personal preference.

Within this context, religion has re-emerged in the form for which I have used the term 'spirituality' within the reflexivity of modern social life, a resource that people use as they find it personally helpful. Some individuals choose the certainty provided by conservative religious movements (Giddens, 1994). Others choose to explore the variety of spiritual resources associated with Eastern religions, the New Age, and nature religions. For both groups, spirituality is no longer the tradition into which one is born and which provides the framework for cultural life. Rather, it is a set of resources from which one can choose according to personal needs and tastes.

This individualistic approach in the religious or spiritual dimension of life has been evident in several ways. For example, the National Church Life Survey (1996) of the church attendees of most denominations in Australia found that there was considerable movement in and out of churches and between churches of different denominations, particularly amongst younger people. For example, of those worshipping in a Pentecostal church in 1996, 28 per cent had transferred in from another denomination within the last five years and 15 per cent of that number had transferred out to another denomination. Ten per cent of them had begun attending without previous involvement in a church elsewhere, but 17 per

cent of that number had drifted out and were no longer worshipping anywhere (Kaldor et al., 1999).

For many people, an individualistic approach meant pursuing religion outside of organisational structures. There has been widespread disaffection with religious organisations with only 39 per cent of Australian adults expressing much confidence in religious organisations (Bellamy et al., 2002).

This disaffection is partly reflected in the increasing proportion of Australians describing themselves as having 'no religion': from 0.4 per cent of the population in 1961 to 15.5 per cent in 2001. Analysis showed, however, that this failure to explicitly identify with any religious group did not mean that all spirituality was rejected. Of those who described themselves as having 'no religion' in the Australian Community Survey (1998), almost half (49%) said that having a spiritual life was important to them. A similar proportion of them said they believed in God or some sort of spirit or life-force (Hughes, 2004a).

The individualistic approach has been evident in some of the new religious and spiritual groups as they organise themselves in shop-front styles, rather than seek to build communities. For example, practitioners of yoga and Eastern meditation hold classes in adult education centres. They orient themselves to the provision of resources for the individual, rather than build communities of people who share their beliefs and commitments. The Australian Community Survey (1998) found that 12 per cent of Australian adults had practiced Eastern meditation in the year prior to the survey. Only 7 per cent of those practicing, however, identified themselves as either Buddhist or Hindu. For most, meditation was another practice, a technique, that might be helpful to them as individuals, not something deeply rooted in a religious community requiring a change in their identity.

Religion and spirituality have not disappeared under the weight of the processes of secularisation, but have re-emerged in more individualistic forms among the younger generations. Nevertheless, the salience of these emergent forms should not be over-emphasised. The Australian Community Survey (1998) asked about the importance of a spiritual life in the context of a range of twenty-two life principles. One third of the sample of the adult population said that spiritual life was 'very important' to them. Indeed, 4.5 per cent of the sample said that 'having a spiritual life' was the most important principle of life. However, for the majority of people, spirituality came at the bottom of the list. Peace, honesty, friendship, social justice, politeness were much more strongly affirmed. Indeed, out of a list of twenty-two values, 'a spiritual life' was number 20 in rank order of importance (Hughes, Bond, Bellamy, & Black, 2003).

Religion is an important part of the identity of just 21 per cent of the Australian adult population, rating below ethnicity, education, occupation, income, gender and personality. It is important mostly to recent immigrants for whom religion and ethnicity are closely related and to those few Australians who feel that the religious group to which they belong has some exclusive claims to truth (Hughes, Black, Bellamy, & Kaldor, 2004). There is little evidence in Australia of religious identity providing a basis for the 'cultural wars' found in some other countries.

What does this Mean for Religious Education?

The analysis above points to a context that has the following characteristics:

1. an openness to spirituality, although the spiritual life is not high on the list of personal priorities;
2. a minority of the population actively and frequently participating in organised religion, but a majority suspicious of religious organisations;
3. an assumption among almost all young people that they will personally decide what to believe and practice.

The several arenas in which religious education occurs in Australian society will inevitably address those aspects of the Australian context somewhat differently. Religious organisations have the duty to explain to those who attend them what they believe and why they encourage certain practices. Nevertheless, they will recognise that, within the pluralist Australian context, children, including those raised within the context of a religious community, will make their own decisions about faith and practice in due course.

Some religious schools in Australia are run explicitly for members of a particular religious organisation or group and some require that parents of students attend worship within that group. In terms of religious education, the sociologist might comment that however carefully parents and schools might seek to insulate children from the multiplicity of influences in the wider culture, they are unlikely to be successful (Hughes, 2002). It would be realistic for these organisations to prepare children to make their own decisions about faith and practice in the context of an awareness of the plurality of the wider culture.

Other religious schools cater for children from many backgrounds. While parents send their children to religious schools in the knowledge that the school will encourage commitment to certain beliefs and practices, such schools should respect the variety of backgrounds from which the children come and the pluralistic context in which they live. If the Australian cultural context lays on young people the responsibility of making their own decisions about belief and practice and the development of their own spirituality, young people should be prepared for that.

Most church-run schools in Australia have retained some confessional elements relating to Christian faith and their particular denominational heritage, including services of worship that take place within the context of school life. However, there has been a movement away from confessional approaches and towards description of the variety of religious belief systems and practices and open-ended discussions of ethical and social issues in religious education (Buchanan, 2003). Understanding the variety of religions is important not just in terms of preparing students for their own decisions but helping students to understand the people who live around them.

Preparation for making decisions about directions in life and faith and understanding the decisions and orientations of others should be part of education in

government-run schools as well as church-run schools. Students in these schools will be faced with the same issues as they find their place as adults in the same pluralistic cultural environment as students of church-run schools. Parents will have decided on their preferences and will naturally have a considerable influence on their children. But such influences will not necessarily equip their children for making their own decisions. At the same time, it is not the place of government-run schools in an avowedly multi-cultural society to encourage particular forms of spirituality.

Various approaches to religious education are currently practiced in Australian schools. Some take a phenomenological approach concerned not just to describe the variety of religions but to understand the universal nature of religion itself (Marvell, 1982). However, there is still debate within religious studies as to whether such a universal essence of religion can be identified. Does such an approach do justice to the various components of religion to which Smart has drawn attention (e.g. Smart, 1997). As Jackson (1997) has asked, does such an approach do justice to the variety of religious experiences and expressions?

In an attempt to find the relevance of religious education in a postmodern pluralist situation, it has been suggested that religious education revolve around the exploration of personal narratives. Advocates of such an approach, such as Clive and Jane Erricker (2000), start with the spiritual, emotional and moral needs of the students. The aim of religious education is to facilitate the children's own construction of a spirituality, rather than to encourage them to adopt an ideology or meta-narrative which has been packaged by a particular religious organisation.

This approach accords well with the finding noted above that, in Australia, most students approach religious faith from a personal and individualistic perspective, choosing what they want from the various traditions and religious resources. However, as Jackson (2004) notes, this approach would not be acceptable or readily understood by those children who come from backgrounds where religious traditions are seen as real descriptions of the world and where the tradition is accepted as a whole package. Among those in Australia who would not appreciate such an approach are many recent immigrants (Hughes, 2004b) as well as some from conservative religious backgrounds. In some way, the variety of religious and spiritual traditions, with their different epistemological stances, needs to be respected.

Combining the strengths of the postmodern approach of the Errickers in its existential interests and aims, with the strengths of the descriptive and phenomenological approaches which seek to take the variety of religious experiences, practices and belief systems seriously, is the 'religious literacy' approach to religious education. Andrew Wright (1996), for example, argues that

the mark of the religiously educated child ...would be his or her ability to think, act and communicate with insight and intelligence in the light of that diversity of religious truth claims that are the mark of our contemporary culture (p. 175).

Jackson adds to Wright's perspectives the recognition of 'the inner diversity, fuzzy edgedness and contested nature of religious traditions as well as the complexity of cultural expression and the change from social to individual perspectives' (Jackson, 2004, p. 87).

Wright and Jackson, along with others, see religious education as allowing children to identify and articulate their already held spiritual values, commitment and worldviews. It also involves clarifying and refining these spiritual commitments (Jackson, 2004). However, most Australian students do not have clearly articulated religious or spiritual commitments. There are many functional alternatives within Australian society that provide a basis for a sense of identity, place and purpose. There are many resources to which Australian students turn to deal with the problems of life or to find a sense of peace and happiness (Hughes, 2004c; Hughes & Black, 1999). Given this variety, it would seem appropriate that what has been called religious education occur within the broader framework I would entitle a 'spiritual literacy approach'.

With the aim of helping young people to evaluate, develop, clarify and commit to specific ways of living in the world, of which religious ways provide specific alternatives, this 'spiritual literacy' approach has a descriptive component. But it is not just about knowledge of the religious traditions. It aims at building skills in making decisions about life, religious faith and spiritual resources. It also aims at developing the skills of translating commitment into action. Nevertheless, it is different from confessional approaches in that it does not assume that students already have a commitment to a specific community or will move into a specific community of faith.

Three major components are necessary for spiritual literacy, similar to those which have been identified as necessary for making moral decisions (Wilson, Williams, & Sugarman, 1967): knowledge, skills of evaluating, and skills of translating commitment into action.

Knowledge of Resources and Possibilities

Several areas of knowledge and skill are important to spiritual literacy. The first is knowledge about the options: the resources and the possibilities. To make decisions about spiritual resources, young people need information about them. Detailed description of beliefs and rituals of all major religions may not be necessary, but knowledge that these options are available and how people have found them to be helpful in life and in society is apt.

In general, priority should be given to those religious traditions that have had the most influence on the historical and cultural background from which the young people come and which have contributed most to the context in which they live. If such education keeps close to the world of the students themselves, it will focus on the ways that religions, philosophies and ways of life are experienced, rather than on the details of the traditions. It will draw from the experiences of those people who have chosen those options and used those resources. It will provide

opportunities for students to assimilate these options and possibilities into their own frameworks of thinking.

In its descriptive content, the 'spiritual literacy approach' will focus not only on the Western expressions that most world religions have developed. It will also be important to cover, at least to some extent, some of the new religious movements. It will be even more important to look at the options of hedonistic life-styles, family-oriented life-styles, the natural world as a source of peace, and travel as a means to finding one's identity.

Skills of Evaluating

To make choices, students must be trained to evaluate, to identify what is good and what is bad, what is worthwhile and what is worthless. Such skills involve knowledge about the roots of revelation and authority in religion, about the implications and consequences of adopting a particular religious stance, and about those forms of reasoning that are pertinent to the acceptance or rejection of religious beliefs and practices. Faith choices are not simply leaps into the unknown. While human beings cannot agree conclusively on the superiority of any particular religion, the evaluation process is not irrational. Rather, the evidence and the issues to be considered in evaluation are so many and so complex that the evaluation process cannot be readily brought to a conclusion. Yet, some choices fit more easily into the world that is known through observation and experience, while other choices are evidently unsatisfactory.

Similarly, the choice of way of life is not simply a matter of taste. Choices have consequences for the individual and for the wider society. Do those who choose to seek peace and wellbeing through travel, or through the accumulation of possessions, for example, really find what they are looking for? Does the drug scene provide a solution to human problems?

People often make their own choices as a result of personality orientations or the influences of peers or family. Yet, there are reasons why some options can be more readily dismissed than others. It is important that young people are fully prepared for the responsibilities of the decisions that they will inevitably make.

Translating Commitment into Action

Beyond skills of making decisions about faith are the skills of translating one's commitments into actions. This is a considerable challenge in a formal educational environment, but might be approached through the development of a variety of small group activities within a school or other social context through which those commitments could be applied. Different groups might explore yoga, Eastern meditation, and Christian forms of meditation and prayer. Other groups might seek cross-cultural experiences, and, in small and manageable ways, seek to live within a different community for a while, absorbing and reflecting on its values and lifestyle, its beliefs and rituals.

Groups might explore commitment to social justice and ways of engaging the wider community in such issues. Or a group might work for the wellbeing of a group of people with special needs, putting into practice the ideals of compassion common to many religions. Another group might explore the spirituality of nature and its implications for living in accord with principles of a sustainable environment.

The Aims of Spiritual Literacy

At the heart of the whole educational enterprise is the wellbeing of individuals and communities. Both primary and secondary education prepare young people to meet the demands of living in the adult world in ways that are beneficial to their own wellbeing and that of the wider society. The contemporary Australian context places on young people the demands of living reflexively in relation to spirituality as well as many other aspects of life.

We are now in the midst of epoch-making changes in culture and the very nature of religion. Given the fact that contemporary culture has 'imposed' on the individual the necessity of making personal decisions about religious faith and spirituality as well as many other choices for life, the need is more urgent than ever for education that will prepare students for those choices. The reflexivity in the spiritual domain that is demanded of students in the Western world requires the development of knowledge, skills of evaluating and the ability to translate commitment into action. To do that, religious education, perhaps best described as the education of the human spirit or spiritual literacy, must focus on the choices of life and the skills in making personal choices in belief and practice for the wellbeing of individuals and society.

Acknowledgements

The Australian Community Survey (1998) conducted by researchers from Edith Cowan University and NCLS Research was made possible by a Collaborative Grant from the Australian Research Council, and the support of ANGLICARE (SYDNEY) and the Board of Mission of the Uniting Church (NSW). The research has been jointly supervised by Prof Alan Black and Dr Peter Kaldor. The research team included John Bellamy, Keith Castle and Philip Hughes. More details of the survey can be found in John Bellamy, Alan Black, Keith Castle, Philip Hughes and Peter Kaldor (2002) *Why People Don't Go to Church*, Adelaide: Openbook.

The Wellbeing and Security Survey (2002) conducted by researchers from Edith Cowan University, Deakin University, NCLS Research and ANGLICARE (NSW) was also made possible by a Linkages Grant from the Australian Research Council and the support of ANGLICARE (NSW). The research was jointly supervised by Prof Alan Black, Prof Robert Cummins and Keith Castle. The research team included John Bellamy, Philip Hughes, Peter Kaldor and Sue King.

RELIGIOUS EDUCATION AND CITIZENSHIP IN POSTMODERN SOCIETIES

Fernand Ouellet

University of Sherbrooke, Canada

Introduction

Intercultural education is generally recognised as an important component of citizenship education. In the last decade, there has been a growing interest in citizenship education in many democratic countries together with an explosion in the number of publications on the subject. This renewal of interest has several possible explanations: the difficulty of maintaining a climate of learning in schools located in depressed areas (Costa-Lascoux, 2000); the ‘perverse effects’ of multi-cultural policies that give insufficient attention to the basis of social cohesion upon which an opening to diversity can be built (Ouellet, 1992; 2002a); and the anxieties raised by the deep transformations of a society in crisis. Galichet (1998) claims that this interest appears regularly ‘each time society is uncertain about its foundations, facing problems and dissensions threatening its existence and raising questions about its legitimacy’ (p. 1). According to Galichet, the legitimacy of the values crisis is one of the fundamental issues of citizenship education, the second being what he calls the ‘scandal of inequalities’.

In this chapter, I shall suggest that an exploration both of symbolic systems and of questions of meaning can help students to face this crisis in the legitimacy of values. First, I shall show that the crisis is part of a deeper crisis of politics in postmodern democracies. Citizenship education is generally seen as an attempt to prepare young people to face that crisis. However, the implementation of citizenship education in the school curriculum is made more difficult because of the extent of disagreement on the aims of such a program. In the second part of this chapter, the reconciliation of key values underlying the main initiatives in this area will be suggested as a means to resolve that problem. In the last part, I shall refer to the present debate on this issue in Quebec, and suggest some of the conditions to be respected if religious education is to make a significant contribution to inter-cultural and citizenship education.

The Crisis in the Legitimacy of Values within Contemporary Western Societies

Galichet (1998) argues that the changes affecting Western democracies are so deep and pervasive that it is no longer possible to rely on classical approaches when it comes to determining the legitimacy of the values underlying citizenship education. He provides an interesting analysis of the process leading to this crisis. According to him, in the classical republican concept, there was only one principle of legitimacy: 'universal suffrage built upon the idea of human and citizens' rights constituting the preamble and the leading thread of all democratic debate' (Galichet, 1998, p. 134). This principle of legitimacy, he states, can be subdivided into three fundamental principles which seem harmoniously integrated:

- *theoretical* reason, i.e. what would be called today, expertise. It determines and delimits the field of what is possible;
- *aesthetic* reason, i.e. the confrontation of the judgments, exigencies, hopes of those who would be called today the 'militants' (of political parties, but also of associative movements). It feeds and focuses the debate by defining – in multiform and contradictory ways – the desirable;
- finally, *practical* reason, symbolised by elections at universal suffrage and the representation which results from it. It decides what will be effectively realised and accomplished.

The present legitimacy crisis, in his view, comes primarily from recent changes, which have destroyed the harmony between these principles postulated in the classical vision:

- expertise, heir of the former theoretical reason, seems itself divided and torn apart: on all burning issues – pollution, AIDS, etc. – experts confront each other and each camp has its own opinion, so that the expression 'battle of experts' indicates the extent to which since Condorcet, science has become an issue instead of being the tribunal which, for a while, scientists dreamed it was;
- universal suffrage too has been split with the diversification of the levels of democracy (local, regional, national, European, indeed global with the multiplication of international conventions having priority over national rights). Everyone knows there are conflicts between these levels and that they cannot always be resolved;
- citizen mobilisation takes a growing importance with the extension of the political field towards issues such as urbanisation, health, and the environment which directly affect daily life. This has given rise to militant resistance movements. Sometimes these movements are instigated by associative movements; sometimes they are purely spontaneous. For instance, more than once, high school manifestations have forced the legal powers to retreat and abandon projects formally approved by parliament (Galichet, 1998).

According to Galichet, these endless conflicts between experts, militants and politicians partially invalidate the classical model used to establish the validity of common moral norms: the constant fluctuation of public and private morals. He gives the example of hygiene:

In the manuals of the end of the nineteenth century, hygienic practice was presented as a social, indeed a moral duty, and dirtiness was associated with alcoholism, and alcoholism was itself associated with theft and depravity [....] These practices have progressively been transferred to the field of personal initiative. Each couple can freely choose among the proliferating panoply of child rearing manuals on the market (Galichet, 1998, p. 137).

The Crisis of Politics and of Citizenship in 'Postmodern' Democracies

Galichet's reading of the contemporary crisis of values is interesting, but it must be placed in the wider context of the crisis of politics in modern democracies. The idea of citizenship is a modern project: the emancipation of individuals from traditional hierarchies, and their autonomous control of their collective destiny were at the centre of this project (Gauchet, 1998; Schnapper, 2000). However, in a perceptive analysis of the transformation of American society, Manfred Bishoff (1999) shows that this control by citizens of their collective destiny has less and less meaning in the contemporary context of labor rights. In the present 'postmodern' context, collective decisions are less and less in the hands of citizens. The practice of citizenship has been progressively destroyed in the double process of a *politicisation of economics* and of an *economisation of politics*.

When the state started to intervene in the economic field, it fell progressively under the control of the economic lobbies of businesses on the one hand and of the labor unions on the other. Moreover, the incorporation of the state within the organisational system has in practice meant its subordination to capitalist economy. The fragmentation and dispersion of the sovereign power of the state and the obliteration of the distance between the modern state and civil society have had serious consequences for the functioning of democracy. The state has lost the capacity to constitute itself as the place of reference, arbitration and representation for the multiple particular and contradictory interests that exist. It is no longer the protector of the 'general interest'. The voice of citizens has less and less importance. Henceforth, only associations (or pressure groups speaking for them) or businesses (curiously named 'moral persons') are actually acknowledged.

In this context, the state is increasingly relegated to the roles of simple mediator and guarantor of the contracts signed by various organisations which function as autonomous and self-governing sub-systems. Their integration within society is

no longer, as in modernity, realised on the politico-institutional level, but on a *decisional-organisational* level (Freitag, 1994). These sub-systems constitute what Bischoff calls 'the social system of postmodernity':

Citizenship's dissolution thus goes along with the dissolution of political power. Postmodernity has replaced both by a number of instances and places of organisational participation which form a system in which the only social and 'political' existence of the individual is through his participation in organisations which have been substituted to him and to the state in the very person of the *social subject* (Bischoff, 1999, p. 420).

In the light of these analyses the crisis underlying the present interest in citizenship education appears still deeper than the one to which Galichet refers in his history of citizenship in France. What has become problematic is the idea of citizenship itself; and also the idea of politics, understood formerly as the control by citizens themselves of their collective destiny. Marcel Gauchet (1998, 2002) shares this conviction that the present situation of democracy is radically different from what it was in the period of triumphant modernity and that the present crisis is completely different from the 'modern crisis'. At the center of this present crisis, according to Gauchet, there is a disequilibrium created by the present hegemony of human rights, which impose themselves on the collective consciousness 'as the only tool available to think of coexistence and to guide the work of the collectivity on itself' (Gauchet, 2002, p. 347). This disrupts the equilibrium between the three essential components of any democracy: the judicial, the political and the socio-historical. Thus 'human rights' becomes an ideology which contributes to the process of making more obscure the way democracy functions:

In short, [human rights] advantageously replace the sciences of society and the theory of history, summarising the essence of what there is to know about what constitutes human communities and what they can hope to be. This evangelical simplicity is not the least of their seduction (Gauchet, 2002, p. 348).

Gauchet is deeply anxious about the future of democracy in a society with no mobilising project, one where politics is discredited and where human rights occupy all the space. He sees a link between the present crisis of politics and what he calls the 'exit of the religious', the victory of autonomy over heteronomy. This very victory explains why today democracy has lost momentum:

Even for a consciousness deeply convinced of one's debt towards the divine, the incarnation in a spiritual authority of this world of a dependency on the beyond does not mean anything for anyone. Even as a symbol of nostalgia, it does not mobilise any inspiration. At the same time, the image of autonomy which proceeded from it has lost its dynamic spring. It has been trivialised

through its triumph. It does not have as its objective a difficult ascension; it is now nothing more than the primary and down to earth data of our condition (Gauchet, 2002, p. 348).

We live now in a disenchanted world. We must say goodbye to what was the main spirit of the political debate during the period of triumphant modernity: the struggle against the religious visions which deprived people of their capacity to decide by themselves their collective destiny:

It has become incongruous and ludicrous to mix up the idea of God with the norm of human society, and even more to dream of some conjunction between the necessities of the earth and the inspiration of heaven. [...] Nothing in our experience, whether it is in knowledge, moral rule, art or politics has any kinship or communication of any sort with anything beyond human beings. [...] In other words, autonomy has won; [...] and that changes everything. (Gauchet, 2002, P. 86–87).

This victory of autonomy over heteronomy radically modifies the nature of relations between political powers and religion. The state cannot rely on one set of particular religious beliefs to legitimise its policies. Nevertheless, it must find legitimacy, and refer to values put forward by religious groups of varying convictions. Willaime gives a good description of the new importance given to religion in the public sphere:

This socio-religious configuration creates a new situation where the religious is no longer present in its pre-modern form of traditions resistant to swaggering modernity. [...] If democracy has been historically in conflict with religions, are we not presently witnessing a situation reversal where religions could bring welcomed support to democracies in their quest for legitimacy? (Willaime, 2004, p. 209, 258)

Willaime (2004) gives many examples of the greater presence of religion in public space. According to him, many citizens welcome the interventions of religious leaders in defense of the principles of democracy, even if ‘they do not accept any intervention of the Churches in their private life or any attempt to control it’ (p. 258). In this new situation, the classical republican approach does not work any more. What is needed is a form of laicity which does not try to eliminate all references to religion in the public space and in public institutions. In the post-modern situation, religion cannot be confined to the private sphere. It is no more possible today to view laicity as ‘an alternative system to religions’. It appears rather as a principle for the regulation of religious convictions present in civil society (Milot, 2002).

The New Configuration of Belief in Postmodern Societies

Gauchet’s analysis throws an interesting light on the particularities of the present period of history and on the profound sources of this crisis in the legitimacy of values by which it is characterised. However, it is not only the relation of

politics and religion which has been transformed by the victory of autonomy over heteronomy in post-modern democracies. This victory has equally radically modified the individual's relations to belief. The relationship of the individual to belief typical of pre-modern societies has already been deeply modified in the modern situation of the last two centuries:

Hence that paradox, that faith has the tendency to become more intransigent and more imperialist than when it was the 'faith of our fathers' by being unconsciously invaded by the individualist values of modernity [...]. In that phase, when it stops being customary and becomes obligatorily the choice of a person, it can only have meaning if it claims to be universally imperative as unique and exclusive truth (Gauchet, 1998, pp. 128–129).

In the context of triumphant modernity, belief is frequently intolerant; and it is understandable that the promoters of democracy preach tolerance. In post-modern democracies, the central value is no longer tolerance but pluralism, 'not the simple resignation to the fact that some people do not think like you', but:

the integration by the believer, in relation to his own belief, of the legitimacy of other beliefs [...]. This intimate relativisation of belief is the characteristic product of our century, the fruit of the penetration of the democratic spirit within the spirit of belief itself (Gauchet, 1998, pp. 129–130).

All this leads to a radical transformation of the relation of the individual to religion. Religion does not represent any longer a transcendent realm imposing itself on individuals; now, it has only an instrumental value for their personal growth. The otherworld is put at the service of this world. In this way, religions tend effectively to align themselves with secular philosophies and wisdoms. Religion is now on the same level as the secular wisdoms, 'the good life in this world' (Gauchet, 1998, p. 149). This is another index of the victory of autonomy over heteronomy. In post-modern democracies, it is not the content of beliefs which is important, but the contribution they make to the individual project of giving meaning to one's life:

What counts, in this case, is not theism or atheism, nor transcendence or immanence, nor this worldly or otherworldly orientation, but the capacity of providing a global view of the world and of human beings, susceptible of giving ultimate justification to individual and collective options. Apart from this, whether the place of the metaphysician is taken by a materialist in despair with our solitude in the universe, by a respectable humanist or by a spiritualist confident in the excellence of creation, is of little importance as long as there is metaphysics (Gauchet, 1998, pp. 144–145).

Nowadays, morals, as the 'capacity of providing for oneself the reasons orienting one's conduct [...], has become central for the auto-constitution of the individual' (Gauchet, 1998, p. 146). However, contrary to the expectations of some prophets of secularisation, this transformation of the individual's relation to religion has not meant the disappearance of religion, but rather a diversification of the spiritual

demand. Many individuals have departed from the 'believing line' (Hervieu-Léger, 2001, p. 71) of their own religious tradition. They try to give meaning to the events and to the world around them in joining in spiritual tradition which has a multiplicity of forms.

Hervieu-Léger (2001) agrees with Gauchet's analysis on this point. Like other sociologists, she observes the 'individualisation and subjectivisation of belief' in contemporary societies. Inquiries have shown that only two percent of Swiss citizens and six percent of French agree with the following statement: 'All religions are respectable, but only mine is true'. She notes a '...disqualification of the traditional mode of validation of the religious truth' and 'a weakening of the familial structure of religious transmission which previously linked an individual to a patrimony of symbolic goods received in heritage and which had the responsibility of transmitting these to the following generation' (Hervieu-Léger, 2001, p. 128). She quotes the 1990 inquiry into the values of French citizens which revealed that only four percent of parents placed religious faith first of the fundamental values they wished to transmit to their children.

Hervieu-Léger provides interesting comments on the new forms of belief in this new context. Those beliefs are oriented toward this world, since 'the obsessive care for the other world seems about to disappear'. Eighty-six percent of French citizens believe that 'the meaning of life is to take the best out of it'. Religion, she states, '...interests our contemporaries in so far as it 'does good', a good that can be felt by everyone in the various aspects of their life on earth' (Hervieu-Léger, 2001, p. 77).

In this context, of the weakening of traditional religious institutions and of the subjectivisation of belief, the question of religious and moral education at school takes on a new meaning. The struggle between the partisans of a confessional school system and those of a secular one, offering no teaching on questions of meaning and on religion, belongs to another time. We are now witnessing a 'laicisation of laicity' (Willaime, 2001, p. 221) that becomes more open to a teaching of the religious fact in schools. Many partisans of a secular education recognise that the ignorance of the rising generations about the religious traditions of their country and of the world presents serious risks for democracy, for relationships between members of pluralistic societies and for understanding between nations. This concern raises the question of citizenship education and of the place in that education for an exploration of symbolic systems and a reflection on questions of meaning.

Citizenship Education in 'Postmodern' Democracies

Obviously, these profound transformations of 'post-modern' democracies have repercussions on the way citizenship education can be conceived today. Galichet (1998) provides some interesting clues for the definition of what citizenship should be in this new situation. In the post-modern context, citizenship education can only be learning to manage these contradictory legitimacies which tear apart societies and individuals. 'Henceforth, citizenship education cannot be separated

from conflict education and conflict management. What is at stake here is not only a conflict of opinion or of interest, but also a conflict of legitimacies or norms' (Galichet, 1998, pp. 142–143).

Society is no longer characterised by 'a coherent and well-determined corpus of values, but rather by multiple and exclusive norms' (Galichet, 1998, p. 143). It is then not to be expected that there will be a complete correspondence between teachers' values and those of various groups of citizens. Neither can it be expected that citizens will profess a kind of common morals, which would be those of their group. Yet one cannot be satisfied with the relativist and individualistic acknowledgement that 'everyone has his own values', since it would mean 'the negation of all education, and, moreover, also of all thinking' (Galichet, 1998, p. 144). In the present context, it is not sufficient to promote the recognition and respect of the other. It is also necessary to learn how to shake 'identity bumptiousness' (Galichet, 1998, p. 144), and to become interested in the other beyond differences and value conflicts. Galichet advocates a 'conflict pedagogy' (Galichet, 1998, p. 144) as a solution to the crisis in the legitimacy of values. This pedagogy is in harmony with a conception of citizenship education where the study of controversial issues occupies a central place (Crick, 1998; Lorcerie, 2002). Such an approach to citizenship education appears particularly well adapted to the situation of tension between many legitimate conceptions of citizenship (Pagé, 2001). It can recognise the inevitable tensions between the diverse conceptions of citizenship and the preoccupations/values underlying initiatives in this area (Ouellet, 2002b). It is in line with recent philosophical discussions on deliberative democracy and on the means to reach a *modus vivendi* on controversial issues about which it will never be possible to reach a consensus (Bonin, 2001; Duhamel & Weinstock, 2001; Gutmann & Thompson, 1996; Pourtois, 1993; Weinstock, 2000; 2001).

Citizenship and Citizenship Education: A Diversity of Conceptions

The implementation of programs of citizenship education in the school curriculum faces many obstacles (Costa-Lascoux, 2000; McAndrew, 2004). Among those obstacles, the diversity of conceptions of citizenship makes it difficult to reach an agreement on the nature of this new school subject.

Pagé (2001) distinguishes four conceptions in the writing of scholars describing citizenship as it is experienced by citizens today: 1) the *liberal* conception, which insists on *the rights protecting citizens' freedom* to invest in their personal, familial and professional achievements, without too much concern for civic participation, except when these rights are threatened; 2) the *pluralist deliberative* conception, which insists on *participation in the political community's deliberation*, the only guarantee that the decisions which are taken for the common good will be acceptable compromises for citizens of various allegiances; 3) *differentiated civil citizenship*, which also insists on *participation, but only in civil society*, where citizens believe they can more efficiently contribute to the creation of common goods satisfying the

converging aspirations of the communities or groups to which they belong; 4) the *unitary national* conception which favors the affirmation of a *strong collective identity* as the basis of society's cohesion, and for the respect of citizens' rights. According to Pagé, it is not possible for the researcher to opt for one or the other of these four theoretical conceptions of citizenship, since they are all 'legitimate in view of the fundamental norm of integral equality of all citizens in a democratic society' (Pagé, 2001, p. 50). They represent a 'diversity of formulas of citizenship which citizenship education should explore as legitimate ways to experience citizenship' (Pagé, 2001, p. 10). Only empirical research can determine which of these formulae wins the support of citizens.

The development of a program of citizenship education requires that these various concepts of citizenship be taken into account. However, this diversity of conceptions can make more difficult an agreement on the goal of such a program. A disagreement on such a fundamental question is likely to weaken any attempt to give this subject more importance in the school curriculum.

A recent study on the early implementation of a program of citizenship education in England and Wales, namely that of the Crick Report and its impact on religious education is a good illustration of this problem (Watson, 2004). The Crick Report (1998) attempted to define the orientations of this program. However, according to Watson, it did not adequately define the program's aims. The report consequently can be used to support both a radical, critical vision and a conservative vision of citizenship education. For those who read it from a critical perspective, the report aims at the 'empowerment of independently-minded young people in a complex, diverse, global context' (Watson, 2004, p. 264). From a conservative perspective, citizenship education's main objective would be 'the control of young people's behavior and the unification of a pluralist society under one nation' (Watson, 2004, pp. 264–265). Educators are then caught in a dilemma: should citizenship education be used to reinforce the status quo or to question some aspects of present social arrangements? The religious education experts involved in the inquiry were generally hostile to a narrow and conservative conception of citizenship education which tried to instill moral, social and political values, instead of questioning them and 'worrying about national unity instead of dialoguing with diversity' (Watson, 2004, p. 266).

This difficulty can be alleviated if we try to identify the main values underlying any initiative in this area. These initiatives must find an equilibrium between three main values: openness to diversity, social cohesion and equality. Citizenship education can be defined as an educational initiative aiming at a reconciliation of eight preoccupations/values: the preservation of cultural diversity, the adaptation of institutions to diversity in all its forms, social cohesion in a context of pluralist values, critical participation in society and in democratic deliberation, equality and equity, solidarity with oppressed groups, and the preservation of biological diversity and sustainable development (Ouellet, 2002a). These values can be used as standards to evaluate the various initiatives claiming the citizenship education label, and the learning goals of these initiatives.

Religion Education: An Important Form of Inter-Cultural and Citizenship Education

The religious options of individuals and of groups of conviction constitute a particularly sensitive zone where there is deep disagreement in contemporary Western societies. Moral and religious values constitute one of the spheres where the passage from modernity to post-modernity has wrought the deepest transformations. An education that does not prepare citizens to face such transformations would certainly be incomplete. Yet, how can it do this in a situation where it is necessary to respect both the secular nature of the schools and state neutrality towards religious and secular life stances? This is the question I should like to explore briefly in the light of recent developments in the public school system of Quebec.

Very often, those who are interested in religion and religious education are deeply committed to a specific religious tradition. Many advocates of religious education in public schools rely on a religious vision of the spiritual development of the child, and of the school mission in this area. Any form of religious education that does not adopt such a perspective runs the risk of being discredited. Nonetheless, in 1999, a special Committee of the Ministry of Education recommended the replacement of confessional religious education by a program of 'cultural teaching on religions'. (Gouvernement du Québec, 1999, p. 67). This recommendation has been rejected by the advocates of confessional religious education. However, recent research (Milot & Ouellet, 2004) has shown that many parents, teachers and religious leaders agreed with this recommendation.

In 2000, the Quebec government opted for a compromise. Confessional religious education was retained for Catholics and Protestants at the primary level and for the first three years of the secondary level. A program of moral education was also offered as an option for all primary and lower secondary pupils. A new program of ethics and religious culture was to be created for the last two years of high school. At all levels, the time for religious education was reduced almost by half. This requires derogation from the Canadian Charter of Rights, since it gives a 'privilege' to Catholics and Protestants. This clumsy compromise has created a crisis, since it was perceived by many teachers as a move towards the elimination of any teaching on religion in schools.

In its recent advice to the minister of education (Comité des affaires religieuses [CAR], 2004), the Committee of Religious Affairs recommends the replacement of the system of options between religious education and moral education by a common program of 'religion education' and moral education. There would be no more an option between religious education and moral education: both would be compulsory for all students. As defined by the Committee of Religious Affairs, 'religion education' differs both from confessional religious education and from the teaching of the religious fact as defined by the Debray Report (2002). The contribution of this program to personal development, and to citizenship education, is the main line of argument put forward by the Committee to justify the substantial investment that the implementation of such a program will require.

The Committee of Religious Affairs defines four essential areas of learning that would be the focus of this program:

- Enabling students to take a stance in relation to the universe of beliefs, which presupposes a clear understanding of their own options.
- Promoting knowledge and acknowledgement of others, thereby enabling others to feel that they are recognised for who they are.
- Leading them to reflect on their own beliefs, thereby enabling them to acquire the tolerance they need to recognise that the convictions of other people are deserving of respect.
- Teaching them moderation in the social affirmation of their identity, which, based on reciprocity, facilitates relationships with people who subscribe to different beliefs (CAR, 2004).

The recommendations of the Committee of Religious Affairs agree on many points with the views developed by Robert Jackson (1997; 2004a; 2004b) in the British context. In the post-modern context presented briefly here, it is clear that religion education has an important and original contribution to inter-cultural and citizenship education in these four areas of learning. A democratic state has the responsibility to create the conditions that would make it possible.

However, in Quebec as elsewhere in the Western world, the place that should be given to a teaching on religions in the curriculum is still a very controversial issue. It is still too early to say what the response of the Quebec government will be to the recommendations of the Committee of Religious Affairs. As the advice of this Committee shows very clearly, the Quebec educational system is presently at a crucial juncture for the future of religion education in public schools. We must hope that the decisions which will be taken concerning the renewal of the derogatory clauses to the Charter of Rights will finally place that debate where it should be: on the pedagogical ground.

The recent (at the time of writing) electoral debate in the United States has shown that religion is still an important reality in 'post-modern' societies. More than ever, citizens must have learnt in school how to make sense of that reality in order to be prepared to live in today's and tomorrow's world.

HUMAN RIGHTS AND RELIGIOUS EDUCATION: SOME POSTCOLONIAL PERSPECTIVES

Liam Gearon

Roehampton University, England

Introduction

Underpinning all conceptualisations of human rights in modern times is the founding Universal Declaration of Human Rights adopted and proclaimed by the General Assembly of the United Nations (UN) in 1948:

as a common standard of achievement for all peoples and all nations; to the end that every individual and every organ of society, keeping this Declaration constantly in mind, shall strive by teaching and education to promote respect for these rights and freedoms (UN, 1948).

Decades later, Fukuyama's (1992) much discussed sound bite about 'the end of history' made claims that this ideal of how a society should operate was now genuinely accepted universally—liberal capitalism had 'won' the Cold War and liberal democracy based on a value system of shared human rights was now the unchallenged model for all societies. Yet the decade that followed Fukuyama's vast claims proved problematic and challenging for any notion of human rights as a universally accepted social and political reality.

Indeed, the horrors which followed in the 1990s—East Timor, Kosovo, Kuwait, Rwanda, Somalia, the former Yugoslavia, and those beyond 11 September 2001—do seem to militate against Fukuyama's thesis. On the surface, Fukuyama's would seem an uncomfortable and even untenable position. Yet, as the history of human rights indicates, this benchmark arose not from any great moral certainty but because of the absence of such (Johnson & Symonides, 1999; Morsinky, 1999). In short, the post-Holocaust years had shaken the international community into constituting or legislating for an understanding of a common moral standard. And post-September 11, revival of an ancient notion of the 'clash of civilizations'

(Huntington, 1992) might seem to be confirmed. Today, especially with world conflicts fragmented into regional and local ethnic violence, the pragmatic need for this common moral framework remains as necessary as ever, however challenged are notions of universal virtue (Macintyre, 1985; 1988). Even a 'post-modern' thinker like Rorty (1989), arguing that there is no non-circular reason not to be cruel, agrees that to be cruel is the worst thing that one human being can do to another. Indeed, philosophers of education recognise that extremes of cruelty and violence are the main source for calls to a moral education from the general public (Haydon, 1999) and the avoidance of human cruelty remains a form of categorical imperative. Its violation, the occurrence of atrocity in war or peace, still has the power to shock, even if the worst excesses of cruelty and abuse sometimes induce a sense of powerlessness in the distant television observer (cf. Bourdieu, 1998, on television as media oppression). Even if there are issues with the idea of moral principles (Fish, 1999), there remains, then, in pragmatic terms, a consensus that this crowded earth needs a form of basic and legal norms to organise and guide its various and diverse communities. Based around the rule of international law and universal human rights, it is this supposed consensus that remains the source of contestation and conflict, against a historical backdrop where human rights discourse has been used and abused for the interests of nation states. Building on considerations from other published work in religious, citizenship and human rights education (Gearon, 2002; 2003a; 2003b; 2004), I present some outline considerations for religious education amidst this human rights culture in the United Kingdom (UK) and internationally.

A Human Rights and Religious Education: Outline Parameters

The best known aspects of human rights are those under the heading of the International Bill of Human Rights which includes the founding Universal Declaration of Human Rights, the International Covenant on Economic, Social and Cultural Rights and the International Covenant on Civil and Political Rights (Langley, 1999). And there are a number of accessible, non-technical guides to human rights and the United Nations machinery that upholds human rights in international law (Forsythe, 2000; Robertson, 1997; Ryan, 2000), if fewer written principally for educators (Gearon, 2003a, cf. de Forest, 2004). In terms of the historical development of human rights in modern times, Wellman (1998) suggests a 'generational approach': a first generation of civil and political rights; a second generation of economic rights; and an emergent third generation of 'human solidarity' rights. But he argues too that the proliferation of rights is more often empty rhetoric rather than moral progress; and it is a thesis which the early years of the twenty-first century might seem to confirm.

Other critics (Chomsky, 2000; 2002; Mills, 1998) suggest human rights can be contested as cultural imperialism from New York and Geneva or as a form of new moral sovereignty imposed by the West. Not surprisingly, some non-Western societies, especially those organised around religious or ideological principles, agree

with such a view. Yet Fukuyama's end of history argument still holds: human rights, however contested, remain the international benchmark for behaviour in the world today, even if the world so often falls short of its own ideals. Thus, in 1993 the United Nations World Conference on Human Rights at Vienna reviewed global progress on human rights. Five years later, on the fiftieth anniversary of the 1948 Declaration, the UN High Commissioner for Human Rights presented a formal Report outlining key issues for the global community and in a grim concluding paragraph commented:

The international community must conclude that five years after Vienna, a wide gap continues to exist between the promise of human rights and their reality in the lives of people throughout the world. At the beginning of the twenty-first century, making all human rights a reality for all remains not only our fundamental challenge but our solemn responsibility (UN, 1998a, §104).

This significant distance between the utopian ideals of the global community and the dystopian realities that so many people in the world actually experience is arguably the key issue for discussions of human rights and human rights education today.

The historic landmark in UK law was the Human Rights Act (1998) which, from October 2000, brought into direct effect within UK law the 1950 European Convention on Human Rights (Leckie & Pickersgill 1999; for legislation affecting other continents see Forsythe, 2000). The Home Office (2000) rightly describes this as 'one of the most significant pieces of constitutional legislation enacted in the United Kingdom' and 'a key part of the Government's program to encourage a modern civic society where the rights and responsibilities of our citizens are clearly recognised and properly balanced'. It will, the Home Office suggests, have:

a vital role to play in building a new human rights culture for the UK, defining this culture as a 'modern society enriched by different cultures and faiths, given unity by a shared understanding of what is fundamentally right and wrong...where people understand that rights and duties are two sides of the same coin, recognise the duties citizens owe each other and the wider community, and are willing to fulfil them' (Home Office, 2000, pp. 1–2).

In these national and international contexts, education is regarded as a crucial context for the promotion of human rights. This was made explicit in some detail in the Vienna Declaration and Plan of Action at the 1993 World Conference. The crucial point here is that education is seen as central in the development of an international human rights culture. The UN General Assembly continues, then, to be convinced of the importance of human rights education as a comprehensive, lifelong process integral to the promotion of human rights themselves, officially proclaiming 1995–2004 as the United Nations Decade for Human Rights Education (UN, 1998b, 1999).

Religious education has a particular potential to address and promote all 'generations' of human rights: civil and political; social, cultural and economic; and those related to human solidarity. In order to achieve this potential, however, religious education needs to take more account of the political implications of teaching and learning in the representation of religious traditions. Evidence of an international perspective on such issues has been led by Kung's work on a global ethic (Kung, 1995; Kung & Schmidt, 1998). Yet Kung's (1995) attempts to promulgate an authoritative platform for a global ethic through the 'Parliament' of the World's Religions, if well-intentioned, remain questionable. However maligned the UN and its achievements (Ryan, 2000), religious educators need to take more heed of the international, historically rooted and democratic processes integral to the development of universal human rights. Religious traditions are subject themselves to international law, and the tensions that such can create are as important from an educational perspective as the many instances where religious traditions can cohere with secular moral systems like universal human rights. It is important that religious communities as well as educators should not invest their own moral reflections with unfounded democratic status; and that they should take account of international legal frameworks. The relationships between traditional religious and moral codes and secular ones are too little explored in education, despite the fact that they can be the source of much tension.

So, in the United Kingdom at least, religious education remains, for all intents and purposes, almost entirely unengaged politically; or has done so at least until recently (cf. Gearon, 2001; 2004; Jackson, 2003; 2004; SHAP, 2003). Thus Michael Grimmitt's (2000) useful survey of pedagogies of religious education, for instance, presents the work of those who have been responsible for undertaking, with their colleagues, some of the most important and influential research and development in the UK during the last twenty five years. including, apart from Grimmitt himself, Alan Brown, Trevor Cooling, Clive and Jane Erricker, David Hay, Robert Jackson, and Andrew Wright. Here is not the place for detailed discussion of this significant pedagogical diversity but the risk of generalising is worth taking, especially if it will lead to further debate. There is a conspicuous absence of a political dimension to most of the approaches presented in the survey. So we have anthropological approaches which look at small scale societies from an ethnographic perspective but with less concern for macroeconomic and socio-political issues (Jackson, 2000). We have supposedly global approaches to tradition which neglect the imperialist missionary enterprises of the past (Brown, 2000). We have conceptual modes of religious development that fail to identify either the mechanism of political power or the imposed models of Western nationalism which lie behind so many cultural constructions (Cooling, 2000; Wright, 2000). This is certainly not an attempt to undermine these contributions to religious education theory or practice. Yet the absence of a significant political consciousness in these approaches to religious education is clear. One natural way to counteract this neglect, in terms of pedagogy, is by a heightened awareness of human rights education within the subject. This itself can be more fully developed as a rationale for citizenship education (Gearon, 2004).

For religious education, universal human rights become inevitably more important in a world where human rights increasingly become a dominant and cross-cultural legal discourse.

Human Rights and Religious Education: Some Post-colonial Perspectives

Where we begin is an uncomfortable starting place: we have to balance religious education's often overly utopian agenda with the often dystopian global realities. Such realities include especially human rights and their abuse; and in particular the part religions have played, and continue to play, in such abuse. Religious educators need to avoid, of course, a simplistic either/or thinking in relation to the historical political engagement of religious traditions—themselves often at the forefront of struggle for human rights and social justice. But the assessment of religious traditions in relation to universal human rights may lead to political critiques. Religions do retain an occasional, if marked, political ambivalence in relation to distant, recent and even contemporary, historical realities when it comes to universal rights. However, from the approaches to pedagogy outlined in Grimmitt (2000), it is quite apparent that religious education has lacked, and continues to lack, both the astute historical depth and the sense of political reality that would easily allow such a consideration. One of the reasons for this is that the subject, understandably, does not wish to cause offence when, amongst other virtues, it proclaims tolerance. What I want to do is present the case for taking more account of the most basic insights of post-colonial criticism as a means of clarifying inherent power relations within and between religions, states and cultures; and to do so through a focus on religious education in relation to human rights.

Yet, at least in the UK, it is precisely such political issues that are seemingly beyond the anodyne definitions of religion given by official bodies such as the Qualifications and Curriculum Authority (QCA) and in their Model Syllabuses for Religious Education, useful as these might be in broader and more simplistic terms (QCA, 1998a; 1998b). How were religious educators to find any guidance in a document uncritically written in collaboration with the Faith Communities' Working Groups (QCA, 1998c), on the critical (that is, often unpleasant) imperial histories and repressive present realities of religion? It is understandable that educators no longer impose the agenda entirely from outside the traditions, and no one wishes to give overt offence. But there must be some means of critical engagement with traditions as living historical entities. For all its attempts to embody individuals within historic tradition(s), Wright's (2000) otherwise excellent work on a proposed critical religious education remains without historical or political consciousness. The models of rationalism proposed by Wright not only are of a Western construction (no fault in itself) but have also too often been used to denigrate the non-Western 'other'. Later official documents do, however, seem to be giving more credence to post-September 11 realities, with references to human rights occurring more frequently (QCA, 2004).

If we are to have a critical consciousness in religious education it must be both historical and political. We cannot always try to seek unblemished religions or pure

traditions. Indeed good phenomenology (Smart, 1989) always tries to place religious culture in social and political context. So often, though, in religious education, the seemingly malfunctioning, impure manifestations of a religion are ignored or proclaimed as simply aberrations, false political representations, impure forms of this religion or cultural constructions. Yet, arguably, as the religion manifests itself, these are part of what the tradition is as a whole. We may extend this analysis by suggesting that while religion does have a positive political role in the promotion of human rights and indeed suffers at times because of this involvement—religions continue to suffer immense persecution for instance (Marshall, 2000)—religious traditions have also actually been a culpable force in the international denial of human rights, especially in the repression of women and indigenous peoples, a process particularly notable in the history of imperialism (Harlow & Carter, 1999; Hastings, 1999).

Ayton-Shenker's brief but important UN Report, *The Challenge of Human Rights Diversity*, sums up the contemporary potential for such conflict:

...[the] confluence of peoples and cultures is in an increasingly global, multi-cultural world brimming with tension, confusion and conflict in the process of readjustment to pluralism. There is an understandable urge to return to old traditional cultures, fundamental values, and the familiar~ seemingly secure of one's identity. Without a secure sense of identity amidst the turmoil people may resort to isolationism, ethnocentrism and intolerance (Ayton-Shenker, 1995, p. 1).

Ayton-Shenker argues that cultural relativism (the word fundamentalism is not used) is a potential threat to universal human rights, and states the UN position: that the rights of an individual state or tradition cannot override rights established by majority international consensus. She argues that this hard-won consensus is a legal safeguard, not the province of any particular region or set of cultural traditions:

...human rights facilitate respect for and protection of cultural diversity through the establishment of cultural rights embodied in instruments of human rights law. These include: the International Bill of Human Rights; the Convention on the Rights of the Child; the International Convention on the Elimination of Racial Discrimination; the Declaration on Race and Racial Prejudice; the Elimination of all Forms of Intolerance and of Discrimination based Religion or Belief; the Declaration on the Principles of International Cultural Co-Operation; the Declaration on the Rights of Persons Belonging to National or Ethnic, Linguistic Minorities; the Declaration on the Right to Development; the Convention on the Protection of the Rights of All Migrant Workers and Their Families; and the ILO Convention No. 169 on the Rights of Tribal Peoples (Ayton-Shenker, 1995, pp. 1–2).

Arguably, it is precisely because religions themselves are some of the worst offenders—historically through imperialism and today through anti-democratic forms of fundamentalism—that religious educators need to take seriously dystopian

global realities of which religions, and related issues of conflict over cultural identity, are a root cause (Gustafson & Juviler, 1999). Post-colonial criticism presents harsh claims about the long-term effects of imperialism and colonialism: states destabilised, economies defrauded, human rights abuses perpetrated, even institutionalised—long after decolonisation, decades after the historical facts of ‘independence’. Post-colonial analysis, far from uniform, has at least this as a common task: to examine critically, and to a greater or lesser extent challenge, those power structures that were and are present between states whose interaction historically involved a coloniser/colonised relationship. The economically privileged Western world does not fare well in this analysis. Key figures like Césaire (1997[1955]), Fanon (1967[1961]) and Said (1994, 1995[1979], 1997) have thus done much towards developing understanding of the cultural, economic and political interplay of power relations between peoples, societies and cultures. Elsewhere I have assessed these thinkers as indicative of a threefold development of postcolonial thinking (Gearon, 2001; also Gearon, 2000): first, the radical anti-colonial—and especially anti-European and anti-American—rhetoric of Césaire’s *Discourse on Colonialism* from the 1950s; second, the radical nationalism of Frantz Fanon’s *The Wretched of the Earth* from the 1960s; third, Said’s transnational post-colonial theory from the 1970s, 1980s and 1990s, from *Orientalism* to *Culture and imperialism*.

The specific place of religious rights in relation to human rights has also been emergent as a field of analysis in the past thirty years or so (Gearon, 2002). Here a key theological reflection, written from within a South African context but of much wider applicability, is Villa-Vincencio’s (1999) *A theology of reconstruction: Nation-Building and human rights*. Villa-Vincencio elucidates his review of harmful theological histories with a frighteningly abundant number of pertinent examples:

The history of Christian crusaders in the ‘old’ world, conquistadors in the ‘new’ and the sense of manifest destiny among North American settlers are different manifestations of a similar theologised mission of conquest. Each is closely related to a theology of empire or nation-building. In more recent times, the missionary arm of British imperialism came close to totally destroying the cultural and religious identity of millions of colonised people. Theological support for Hitler’s Third Reich contributed to the annihilation of six million Jews (Villa-Vincencio, 1999, p. 19).

It is precisely these sorts of realities with which religious education, in the UK at least, has never really come to terms. This may be because of the difficulty here of Britain’s facing its own imperial past when it wishes rightly to promote tolerance and understanding in an integrated multicultural present.

In terms of historical and political analysis, though, Fanon’s revolutionary stance is unambiguous:

The recession of yellow fever and the advance of evangelization form part of the sheet. But the triumphant communiqués from the missions are in fact a source of formation concerning the implantation of foreign influences in the

core people. I speak of the Christian religion. The Church in the colonies is the foreigner's Church. She does not call the native to God's ways but to the ways of the white man, of the master, of the oppressor. And as we know, in this matter many are called but few chosen (Fanon 1967[1961], pp. 31–32).

Fanon's call, like Césaire's, is a call to violent uprising at a time in the early 1960s of decolonisation and the re-assertion of national cultural identity. The issue of violence is so often treated in religious education through its dialectical antithesis, non-violence; in the colonial context this always means Mahatma Gandhi and, in civil rights terms, Martin Luther King. These are excellent case studies but they do not present the full picture: what, for instance, of violence (*vis-à-vis* Fanon; *vis-à-vis* the Middle East, *vis-à-vis* China-Tibet; *vis-à-vis* Iraq) perpetrated by religious traditions themselves (or the violence religious traditions suffer at the hands of anti-religious ideology)? Mission and evangelisation are still current today. These matters of conversion are not simply of historical interest: for the cultural force of divergent worldviews still clamour for voice and space and the ensuing conflicts so often have ramifications in the public world of politics brought to us now so immediately by 24–7 media.

Writing with a less revolutionary post-colonial agenda, Said (not without critics for this) moves beyond the narrow nationalisms of Césaire and Fanon to a more accommodating stance in which 'world institutions are seen as working together' (Said, 1994, p. 341). But it is a world in which imperialism has been transformed rather than eradicated, a world in which the new imperialisms are ever-manifest, often as inequalities of the power structure—political and theological, economic and cultural—which facilitated the abuse of human rights in the first place (Addo, 1999; Cahil, 1999). The Christian churches were integrally involved in the history of this imperialism. They remain actively involved with this broad understanding of human rights, and especially with the new forms of economic imperialism. (Atkin & Evans, 2000; Christian Education Movement[CEM], 2000; Clement, 1998; Hogan, 1998). As Said comments, imperialism 'did not end, did not suddenly become past', once the dismantling of the classical empires had begun:

Accumulation on a world scale; the world capitalist system; the development of underdevelopment; imperialism and dependency, or the structure of dependence; imperialism: the repertory is well known in economics, political science and sociology...(Said, 1994, pp. 341–342).

The precisely elaborated and reasoned curriculum agenda has yet to follow. The process has been accelerated in the UK with the introduction of citizenship as a National Curriculum subject (Gearon, 2003b). Internationally religious education can be seen as being forced into consideration of events which show that religious traditions are not content to rest quietly in the privatised margins of power and that the rise of the public face of religion in modern/ postmodern times is now more than an intellectual curiosity (Gearon, 2002, 2004).

Conclusion

I have tried to raise questions for an enhanced political awareness for religious education through human rights as but *one* important aspect of historical and contemporary international relations. Arguably in the twenty-first century, religious education will only be able to fulfil a developed role, including a strong relationship with developing areas like citizenship, if it continually reminds itself of the political dimensions of religion and the necessity for religious education to contribute actively to a raising of political as well as religious consciousness. The best models for emulation in such a political religious education are those which look at the place of religion in the context of an international values consensus which, however imperfect in practice, has been agreed by democratic process. An excellent example of such is Paul Marshall's (2000) innovative and ambitious study of *Religious freedom in the world*—the right to religious freedom, for example, is still denied by many authoritarian regimes, some of whom profess religious ideals of equality and tolerance.

One of the unstated flaws of religious education is its overly ambitious aims—such have included the transformation of spiritual, moral, social and cultural consciousness (Copley, 1997, 2000). Where such laudable aims fail is in idealistically neglecting the harsh global, political, so often dystopian, realities. The political context for religious education is nowhere better set than within the context of post-colonial criticism. The challenge is for religious education to play its part in evaluating critically historical as well as new forms of imperialism and the denial of rights which such engender. As religious educators, we need here to take a hard look at religious traditions in order to examine honestly the clashes between their ideals and those reached by international democratic consensus; and the pronouncements of Kung (1995) and Kung and Schmidt (1998) are useful only if they are contextualised in the wider structure of international relations and relevant non-government organisations active in the field (Forsythe, 2000).

Just as religions themselves have always had prophetic traditions that have offered a voice for the voiceless, so an understanding of the involvement of these same traditions in dystopian political realities encourages a greater sense not only of ambivalence but also of urgency and relevance to religious education's fine utopian ideals.

ETHNOGRAPHY, RELIGION AND INTERCULTURAL EDUCATION

Eleanor Nesbitt

Institute of Education, University of Warwick, England

Introduction

This chapter is based on the following principles: education entails providing a safe and stimulating environment as well as the teaching and the facilitation of learning within it and it involves not only the curriculum but also what is extracurricular. Consequently, intercultural education must encompass both, and it is certainly not restricted to particular subjects in the curriculum that might seem to be especially germane such as, in the United Kingdom (UK), religious education. Education that is intercultural enables all concerned—and certainly educators and students—to question stereotypes and so to think critically about the meaning of such terms as culture, religion, ethnicity and race. Intercultural education affirms human diversity and has as its goal greater communal harmony as well as individual enrichment.

The goal of moving towards greater communal harmony is grounded in the view that mutual respect, and indeed friendly, open-minded interest in others, are fostered by having a sound basis for understanding social diversity. Sensitively respectful open-mindedness to one's neighbours' assumptions, preoccupations and priorities is a prerequisite for insights which extend one's capacity for appreciating difference and so for forging friendships. Such a capacity is integral to individual enrichment. Another term for this socially-oriented expansion of personal horizons is education. In other words effective education ('leading out', as a glance at the Latin root reminds us) is inherently and necessarily intercultural.

The needs of an increasingly interconnected global society require that education should be intercultural in all schools in all societies, whether or not the school, its local community or the country to which these belong are generally regarded as culturally diverse. In any case even the most 'monocultural' of schools and localities is culturally diverse in terms of gender, generation, social class, interest groups, even if it is not ethnically or obviously diverse.

I shall briefly summarise the ‘Warwick studies’ before explaining how ‘ethnography’ and ‘religion’ are to be understood in the context of RE and culture. After that I shall suggest how insights arising from the Warwick studies can be applied to teacher training. Another Warwick publication elaborates this by exemplifying practical implications in the context of the school curriculum, ‘pastoral care’ and school ethos (Nesbitt, 2004, especially pp. 154–66).

The Warwick Studies

The ‘Warwick studies’ are a cluster of projects of varying scale. They consist of a series of externally funded projects which commenced in 1983, under the direction of Professor Robert Jackson, and also include pieces of research conducted at Masters and doctoral level by our graduate students.

For more information about the research projects of the 1980s and 1990s, which looked at the lives of young Hindus, Christians, Sikhs, Jews and Muslims see Nesbitt (2001, 2004). For one of the more recent projects, concerned with the values education programme for mainstream schools that has been developed in association with a Hindu-related New Religious Movement, see Arweck and Nesbitt (2004).

Among the studies carried out by students at the University of Warwick is Sissel Østberg’s authoritative examination of the processes underway in the identity formation of young Norwegians of Pakistani Muslim family background (2000a, b, 2003). Recent doctoral research by Bill Gent examined the educational significance of the experience of young Muslims, in part of East London, in their Islamic supplementary classes (2006). These classes include both *madrasa* and *hifz* classes. In *madrasas* (or, more correctly, *maktabs*), which are attended by many Muslim children, pupils learn how to read the Qur’an in Arabic. *Hifz* students, a much smaller constituency, are committed to learning to recite the Qur’an in its entirety from memory. Gent investigated the complementary role of such classes in the wider ‘learning community’.

All these Warwick University-based studies, conducted over two decades, have been ethnographic.

Ethnography

Ethnography is literally, in its classical Greek roots, nation- (or people-) writing and it has come to have several related meanings in contemporary European languages. The term is used for a qualitative style of social research that relies mainly upon field studies. For these studies the principal tools are interviews and observation. Where possible the interviews are not rigidly structured but are flexible enough to allow the interviewee to share ideas and experiences in depth. The observation often involves the observer in sharing in the life of the community concerned.

To varying degrees the observer is a participant, and so it is not surprising that, increasingly, ethnographic researchers reflect upon the ways in which, as interviewers and participant observers, they influence the data that they collect. The

way in which a question is framed affects the type of responses that interviewees offer. What they say will also depend in part on how they perceive the interviewer in terms of gender, age, social standing, ethnic community and so on. The extent to which members of a community perceive the observer to be 'one of us' or 'different from us' affects their interactions, at least with the observer. Among the growing number of ethnographers who have published their musings on the complex inter-relationship between themselves and 'the field' are Lubna Nazir Chaudhry (1997), S. C. Heilman (1973, pp. ix-xiii), and Dhooleka S. Raj (2003 especially pp. 10-13). Searching reflection of this sort is essential to the researcher's reflexivity.

Ethnography as we know it today has developed from the forays of enquiring administrators in nineteenth-century colonial settings, and the investigations by Western anthropologists in (usually non-European) societies in the first half of the twentieth century. These studies involved longer journeys for the field worker than the University of Warwick studies have done, and a longer immersion in the field than some of the Warwick studies. Indeed, Martin Stringer (1999), in a study of Christian congregations in the UK, endorses the view that ethnography necessarily entails prolonged immersion in the community concerned. This is certainly the ideal, but my contention is that small-scale qualitative studies can also be accurately called ethnographic. Thus, small-scale studies (lasting perhaps one term), of the sort that our students at the University of Warwick conduct as part of their MA in Religious Education course, are ethnographic insofar as the students are trained in the practical and ethical issues and conduct their enquiries both reflectively and reflexively. Moreover, an ethnographic approach to life, whether as a student or an educationist or both, is possible by looking critically for one's own buried assumptions, while looking enquiringly at another person's (Nesbitt, 2004, especially pp. 5-7).

Intrinsic to this ongoing reflectiveness is what my colleague Robert Jackson terms an interpretive approach. Jackson has elucidated and developed this in many publications (notably 1997 and, more briefly, 2000), by discussing an anthropologically-based study of religions that encourages learners and teachers to make conscious connections. One set of connections links their own experiences and those of members of another group; the other set involves recognising the ways in which 'parts' (e.g. a denomination, a personal belief or a religious rite or a scripture) relate to the 'whole'—in this case a 'religion' or a 'faith tradition'.

Religion

Although this section's concern is 'culture', it is the overlapping—and similarly fuzzy, fluid—concept of 'religion' that is dominant in this chapter. 'Religion' and 'faith' are terms which are often used in English interchangeably, although the spectrum of meaning for one does not exactly match the spectrum of meaning for the other. By many religious educationists the longer terms 'faith tradition' and 'religious tradition' are used in preference to 'religion' in the hope that 'tradition' suggests something less bounded and reified. The Warwick studies have focused upon religion, in the sense of focusing on the experience of young people who

identify themselves by a religious label such as 'Hindu'. As members of particular faith communities (Sikhs, Hindus etc.) their religion was an aspect of their identity and culture which they readily voiced. Their family's first language and country of origin were other aspects, which they tended to conflate with their 'religion'. Thus some children regarded 'language' and 'religion' as equivalent terms and used, for example, 'Sikh' and 'Punjabi' or 'Hindu' and 'Gujarati' or 'Hindi' interchangeably. (Looked at from another angle, it is a contemporary Western tendency to disaggregate experience—and culture—artificially.) When one young person spoke of his religion as something which could not be changed in the same way as one could alter one's nationality and passport he probably spoke for many others.

Young people were selected for the purposes of the studies conducted in the 1980s and 1990s young people were selected out of those who attended regular activities which were explicitly linked to a faith community. These activities included (for Christians) Sunday school, an institution now known by a variety of names, and for young Muslims supplementary classes for learning to read the Qur'an.

The Warwick studies' focus on 'religion' (rather than primarily on culture) went far beyond these activities and was, indeed, almost as wide as the young people's daily life. The studies recorded and reported aspects as diverse as their attendance at supplementary classes (held in community centres and places of worship) and celebrations in their Jewish, Muslim, Hindu, Sikh or Christian community, and their ideas about God and about what happens after one dies. They took into account, among other things, their participation in religious education lessons in their state schools, their assumptions about diet, and their experiences of racism.

The decision to investigate the experience of young people from the UK's 'principal religions', rather than from 'cultural groups', followed naturally from the fact that syllabuses for religious education in English and Welsh schools are based on the twin assumption that there are six 'world religions' and that these are distinct from each other. This framework for viewing society is now, arguably, further justified by the signs that religion is an increasingly evident form of self-identification. In the UK, government discourse and strategy have shown an upsurge of interest in faiths since 11 September 2001, and the Council of Europe has also been prompted to examine the relevance of religion for education (Council of Europe, 2004).

At the same time the Warwick studies' focus on 'religion' raises several issues. One objection to using religion as a basis for selection is that our young people did not include those who are unaligned with any religion and so answer 'I am nothing' to the question 'What is your religion?' (Rudge, 1998). In many schools in the UK, and in some other parts of Europe, such young people are in the majority.

A second problem is that of artificially 'isolating out a Hindu sample, rather than studying an existing social matrix' (Searle-Chatterjee, 2000, p. 503). It suggests a 'pre-existing identity'. This 'isolating out' is problematic both because it assumes that 'religion' and 'Hinduism' can be separated out from the rest of an individual's or a group's experience and also because it assumes that there is an unproblematic

boundary between religious constituencies. According to this argument we damage our understanding of society by defining and selecting out 'religion' and its assumed bearers.

Insights from the Warwick Studies

However, it was this very experience of examining the experience of young people, with whom contact had been made through their families' religious organisations, which undermined, and so challenged, any tendency that we might have initially had to conceptualise religions as homogeneous, bounded or discrete. Moreover, as the basis on which Jackson's interpretive approach was developed, these studies have provided tools which may be applied to more 'secular' communities and settings. The Warwick studies left no doubt that some of the imagined boundaries between, for example, 'Sikh' and 'Hindu' are arbitrary and porous, and that, whether pupils identify with a faith community or not, their values and attitudes (for example, on gender, diet or leisure) are formed to varying extents by influences via the media (for example, soap operas and popular music). Such influences override any imagined boundaries between individuals who identify themselves as 'Hindu' or 'Catholic', 'religious' or 'non-religious'. Nesbitt (2004, pp. 21–34) illustrates the cross-community interplay of factors regarding dietary attitudes and practices.

Diversity

What has also been clear, in study after study, is the diversity of individuals who might share the same religion-related designation. Among Hindus, for example, not only were there differences of gender, generation and personality but also of ethnicity (as Punjabis or Gujaratis, with mother-tongues, cuisine, devotional styles that belonged to specific regions of India) and of *sampradaya*. *Sampradaya* is sometimes translated as 'sect', a word, imbued with the history of European Christianity, which does not convey the sense of *sampradaya* as a succession of gurus and their devotees. Britain's Hindus include devotees of the living 'god-man' Sathya Sai Baba, of Swaminarayan and Pushtimarg (two specifically Gujarati *sampradayas*) as well as those influenced by the Arya Samaj (a predominantly Punjabi *sampradaya* with a rather Protestant resistance to worship focused upon images of deities) and many other teachings and groupings. Members of some faith communities (for example the Muslim families in Birmingham) presented their faith as an undivided unity, but diversity along lines such as ethnic background, *tariqa* (i.e. a Sufi order), and exposure to Western-style education provided clues to a divergence of assumptions and aspirations (see e.g. Smalley, 2002).

The Warwick research has also disclosed the fluidity and change underway among adherents to a particular faith. During the research period some Sikh families were strongly influenced by the political violence that beset Punjab in the 1980s and early 1990s (see McLeod, 1997). In the eight years between two phases of the study of

young Hindus, some reported movement from being non-vegetarian to vegetarian by themselves or by other family members (Nesbitt, 2004, pp. 21–34). Some young people from Christian families (which could be described as Evangelical and charismatic) described the changes associated with ‘asking Jesus into their lives’ or being ‘filled’ with the holy spirit (Nesbitt, 2004, pp. 35–49).

Challenging Boundaries

Evident too are overlaps between the assumptions and practices of Punjabis who identified themselves variously as Hindu and Sikh. The issues concerning the historical reasons for ‘religions’ (in this case ‘Hinduism’ and ‘Sikhism’) being defined in the way that they are can be explored elsewhere (Nesbitt, 2005; Oberoi, 1994). One overlap between supposedly separate communities concerned festivals. For example, not only Hindus but also many Sikhs celebrate Diwali, the autumn festival of light, and Raksha Bandhan, the festival in August when sisters honour their brothers by tying a special ornate thread round their wrist. Moreover, society as a whole, and above all most primary schools, ensure that children of all faith backgrounds and none are involved in preparation for Christmas and, to a lesser extent, Easter unless vigilantly non-Christian parents make a very definite stand. Young British Hindus and Sikhs whom I interviewed spoke of their enjoyment of Christmas meals and Christmas presents (Nesbitt, 2004, pp. 52–54).

Another overlap was the matter of caste, since in the UK young people from South Asian families belonging to the lowest castes suffer prejudice from Sikhs probably more often than from Hindus (Nesbitt, 2004, pp. 98–112). It should be explained that the ‘caste system’ is a social hierarchy that is rooted in the Hindu tradition, with which it is often identified, but that South Asians of other faith communities are also implicated in a number of ways. For example, in a particular part of India Muslims or Christians may be from families which are still associated with the ‘low’ caste to which their forbears belonged. Families that immigrated to the UK from Punjab (in North West India) identify with different religious labels. For a marriage to be arranged (or at least approved) by older members of a family frequently means not only that marriages should take place between coreligionists but also within the same hereditary community or caste. Not surprisingly, Punjabi families living in the UK may still feel and voice certain prejudices and preferences that are based upon their perceptions of another Punjabi’s caste. Children, with no first-hand experience of India, still use caste-based stereotypes which on occasion fuel incidents of playground name-calling.

Widespread media coverage, backed by the work of some scholars, pictures young people from ethnic and religious minorities as being torn between the two cultures that they attempt to straddle (e.g. Anwar, 1998; Ghuman, 1994). Without playing down the pain or the ingenuity of many individuals, the studies at Warwick have suggested a more complex scenario in which young people demonstrate their multiple cultural competence (Jackson & Nesbitt, 1993, see p. 75) and their integrated plural identity (Østberg, 2003, pp. 218ff).

Terms and Concepts

The Warwick studies also revealed that individuals from different faith backgrounds used certain apparently shared words and phrases differently from each other. One of these was 'God' and this is explored in Nesbitt (2004, pp. 66–80). The following quotation from an interview with a ten-year-old Sikh boy illustrates two issues. (It needs to be explained that in colloquial English in some parts of the UK 'ain't' is used in lieu of 'aren't'): 'Sikhs ain't allowed to smoke. Our Gods ain't smoking, that's why'. Here we find God in the plural, as commonly happened when Sikhs or Hindus were speaking. Speakers moved from the singular to the plural and back without any concern. The statement also shows how, as was the case with many Sikh interviewees, 'God' served for 'Guru', one of their ten historical spiritual masters. For both Hindus and Sikhs the word 'God' in fact covered a spectrum of meaning that overlapped with Judaeo-Christian understandings of God, but included, for example, living human 'incarnations' of God. Thus a Hindu might refer to Sathya Sai Baba or another living spiritual leader or guru as 'God'.

Similarly 'baptism', when used by Sikhs, referred to the rite more correctly known as *khande di pahul* or *amrit sanskar* i.e. initiation with the two edged sword (*khande*) or the holy water (*amrit*) life cycle rite (*sanskar*) (Nesbitt, 2004, pp. 66–80). Likewise, Sikhs used the word 'priest' for the *granthi*, the person who attends to and reads from the scriptures, regardless of the fact that the English word has, on the one hand, strongly Christian connotations of vocation and ordination (and a job-description that includes pastoral care for a flock), all of which are absent from the Sikh tradition and, on the other hand, the connotations of a hereditary priestly class (as in the Hindu tradition).

Thus fieldwork reveals ways in which minorities incorporate English words into their articulation of their faith, and (conversely) instances of English words that are gaining new areas of meaning. Clearly teachers need to be aware of the ways in which their own understanding and use of particular terms may differ from their students'. Words may be shared to a greater extent than meanings, and the very fact of sharing words obscures differences in understanding.

Culture and Choice

The Warwick studies also highlighted the need to question assumptions that are made, by teachers among others, about their pupils' cultures and choices. If we take a young person's diet—for example, a diet that excludes all meat or that excludes the flesh of particular animals—it is easy as educationists to talk about this in terms of that young person's 'culture', or we may use the words 'tradition' or 'religion'. If so, we are assuming that this is a collective matter, an example of an ethnic or religious minority conforming to its own customs. Alternatively, someone may use the language of 'choice' and 'decision' and so of 'agency' (James & Prout, 1997). In these terms young people decide what they will eat and the attitudes that they have towards eating some food and avoiding others are their individual preferences. Our four ethnographic studies of young Hindus showed a spectrum of

attitudes and practice and the inadequacy of using either the language of 'tradition' or of 'choice' or 'agency' (Nesbitt, 2004, pp. 81–97) These individuals' behaviour resulted from interacting factors and might differ in varying social contexts or at different stages in life. Several had moved from being non-vegetarian to being vegetarian, and—in some instances—had returned to eating meat, and their reasons were not all specifically Hindu or Indian. Our research endorses an understanding of culture as multiple, contextually informed decisions by individuals, rather than as either simply an individual's or a group's inheritance or as their new creation (Nesbitt, 1995).

Educational Insights from Supplementary Classes

In 2004 Gent reflected upon the challenges to educationists of values that underpin the Islamic supplementary classes which he has studied as an ethnographer. Rather than strengthening Western prejudice against Muslim practice, his data are an encouragement to European educationists to re-evaluate more positively the role of memorisation in mainstream schooling and the degree of agency exercised by young Muslims who opt for rigorous out-of-school application to learning to recite the Qur'an.

Gent's work will contribute to the small but growing body of research on supplementary classes—studies which not only raise issues for main stream educationists but also inform our understanding of minorities. Thus the Norwegian anthropologist, Nora Stene Preston's, work on the experience of young Coptic Christians in a London congregation discloses the reasons why a faith community may encourage the dominance of English over the first language (in this case Arabic) of the parents' generation (1998).

Teacher Training

It is important that trainees be made aware of insights from ethnographic study of faith communities. Through a critically receptive reading of the ethnographers' reports they can encounter the meanings of 'faith' and the nature of cultural change in a range of communities. In this way their first hand experience is deepened and extended. So, Marie Gillespie's empirical study of young Punjabis (mainly Sikhs) in West London detects interactions between their consumption of the popular media and their construction of who they are (1995). Meanwhile Kathleen Hall's Leeds-based ethnography sets young Sikhs' identity-formation in the multiple frames of national and local politics (2002). Both accounts challenge any teacher's tendency towards reifying (and freezing in a time warp) supposedly discrete 'faith communities'.

At the same time, the benefits of adopting an ethnographic approach more generally are relevant to educational practice. As such they need to be included in both initial teacher training and continuing professional development. Here, however, there is the problem of competition for trainees' and teachers' time from

the many other components of teacher training. In the UK, where both religious education and citizenship are statutory elements of the curriculum, one way forward is for a 'cascade' process, whereby trainees and participants in in-service training who specialise in these subjects are grounded in an ethnographic approach and encouraged to share this with colleagues. Thus, in primary schools, the co-ordinator of religious education has a responsibility for providing some in-service training for non-specialist colleagues whose timetable also includes religious education, and this facilitates the spread of information and ideas. However, the inspection- and assessment-driven character of primary and secondary education provides a continual challenge to this sort of dissemination.

From colleagues in Initial Teacher Education in the UK come practical suggestions for inducting trainees into an ethnographic approach. At Winchester University in the South of England Dr Anna King reports setting a group exercise when introducing trainees to my book (Nesbitt, 2004). In groups of four, the students questioned each other on subjects such as diet, marriage and God. From each group a respondent reported back, and the interviewees commented on how faithfully they felt that they had been represented. The class discussed the questions that had been chosen, the accuracy and sensitivity of the listening and the nature of reflexivity.

Trainees were both moved and intellectually stimulated (King, 2004, personal communication [email], February, 2005).

The ethnographic approach that I am advocating as a strand in training will involve, firstly, developing a deliberate stance of questioning what one takes for granted, while being open to others' assumptions. Often members of a majority community have particular difficulty in even identifying their assumptions about, for example, individual autonomy, gender roles or humour. Or, their acute awareness of a historical struggle, perhaps for female emancipation, may make it all the harder to enter imaginatively into the thought-world of, say, a recently arrived minority community whose attitudes and practices appear 'backward' and 'repressive'.

Secondly, an ethnographic approach will require that one subjects curriculum materials, whether published or home-made, to ongoing critical appraisal. Questions to ask will be: Do the text and the images reinforce particular stereotypes? Look for the portrayal of women, men, members of visibly different ethnic groups. Does the material generalise unnecessarily? Is it out of date? A recurrent instance in the UK is the depiction of Inuit (labelled as 'Eskimos') as living in igloos, hemispherical homes built of snow.

Thirdly, an ethnographic approach will become the basis of a style of pedagogy that encourages pupils to 'build bridges'. At the University of Warwick, closely related to the ethnographic studies, Jackson's interpretive approach was exemplified in curriculum books, the Warwick RE Project. Two examples provide the flavour. Pupils were helped to connect a Pentecostal child's experience of the Holy Spirit with the narrative of Pentecost in the Biblical book of the Acts of the Apostles (Everington, 1996, see p. 28). Later they were invited to make a connection between an important event in their own lives and the preparations that Paul, a Roman

Catholic boy, was making for his confirmation (Everington, 1996, see p. 32). This involves the pupils in acquiring the ethnographic skills of (a) reflecting on what they are learning about the young Pentecostal's or Roman Catholic's experience and concepts in the light of their own and (b) reflecting on their own experience and concepts in the light of the young Pentecostal's or Roman Catholic's. But this attention to 'bridging' between 'parts' and 'wholes' (and between different 'parts'—such as the child's experience and Jesus' first century followers' experience of the Holy Spirit) and between oneself and others should not be restricted to the study of religion.

Intercultural education requires its wider application. As stressed at the outset, the whole curriculum and indeed the school's ethos need to be planned to maximise their potential for intercultural education. For example, those with responsibility for school management will need to reconsider criteria for recruitment to teaching and auxiliary staff. Consideration of 'equal opportunities' and representation of minority or less privileged groups will also be necessary.

Conclusion

Religion's inseparability from culture, both historically and in the contemporary world, means that field studies of faith communities are relevant to resourcing intercultural education. In particular they provide insights into the plurality of individuals' identities. We risk forgetting the increasing cultural plurality of the individual, whether as a result of the influence of the media and of personal contacts, social mobility, intermarriage or spiritual questing (Nesbitt, 2003). As we have seen, education about diversity must not stop with an assumption of diverse societies that consist of fairly distinct, homogeneous 'communities', but must take account of individuals' capacity to integrate a variety of group identities (such as Pakistani, Muslim and Norwegian or Asian, British, Hindu and Scottish). Reflective practice requires educationists to consider their own plurality—perhaps as a politically liberal, non-religious, fair-complexioned person who is involved in particular types of sport, music or other leisure activities—and how personal plurality interacts with other people (who are themselves also plural) in a variety of contexts (for example, in school, in one's family, in one's preferred social setting).

Anyone seeking further assurance of ethnography's key role in education is commended to access the exposition by Francesca Gobbo of Turin University (2003). Any reader who is interested in exploring further the contribution that an ethnographic approach can make to intercultural education, or who wishes to gain a fuller picture of the Warwick studies, is recommended to look at Nesbitt (2004). The examples mentioned above of studies conducted in England (and Norway) are intended to illustrate the power of the particular individuals, groups and behaviour that one observes locally to challenge generalisations. Such examples also affirm and celebrate young people as agents rather than as passive receptacles of 'religion' or 'culture'.

UNDERSTANDING RELIGIOUS DIVERSITY IN A PLURAL WORLD: THE INTERPRETIVE APPROACH

Robert Jackson

University of Warwick, UK

Introduction

The interpretive approach outlined in this chapter was originally developed for use in religious education (RE) in publicly funded community schools in England and Wales, where the subject is primarily concerned with helping pupils to gain a critical and reflective understanding of religions. The approach has subsequently been developed further in the UK, and has also been used in Norway, Germany, Canada and Japan as well as in a Council of Europe project on bringing the dimension of religious diversity to intercultural education across its 46 member states (e.g. Council of Europe, 2004, 2007). The approach forms the basis of the theoretical framework for pedagogical studies being conducted as part of a European Union Framework 6 research project on religious education by a consortium of ten European universities (Jackson, 2006; Jackson *et al.* 2007).

This chapter is concerned with describing the methodology of the approach, showing how it developed from ethnographic studies of children from religious groups (some of which are outlined by Eleanor Nesbitt in the previous chapter) and developed further through curriculum development and school-based action research. Though the approach draws on the social sciences, it does not reduce religious education to 'sociology', but provides rather a means to personal engagement with religious ways of life. However, it does bring from recent social science practical techniques for interpreting the worldviews of others, and a concern with issues of reflexivity. This last point is important, since arguments against drawing on pupils' own personal views in religious education (see the chapters by Grelle on the USA and by Estivalezes on France below, for example) tend to assume that this element is derived from religious or theological sources, rather than from social science disciplines such as recent social and cultural anthropology.

It should be noted that the interpretive approach does not claim to be a total method for the subject—it does not claim that all the processes of religious education rely on the social sciences—and it can be supplemented fruitfully by other methods and approaches e.g. philosophical, textual, artistic and historical. Those who have developed the approach have made use of such complementary methodologies.

The interpretive approach developed from three related strands of work at the University of Warwick. The first was a series of studies of individuals from various religious groups in Britain, with a concentration on studies of children and processes of transmitting religious culture. The second was a concern with issues of method in relation to practice and theory, which related both to the research studies in the field and to religious education in classrooms. These studies led to a critique of some of the ways in which religions have been portrayed and interpreted conventionally in the history of religions and in religious education. Questions derived from fieldwork, relating to the inner plurality of religions, to the personal yet group-oriented nature of religious expression and to the relationship between the researcher and the object of study, led to a synthesis of experience based on ethnographic studies and theory from a number of disciplines and fields in the social sciences and humanities. Recent debates in social anthropological theory, religious studies and cultural theory, for example, were reviewed in relation to methodological issues in ethnographic fieldwork and in religious education. The third was the development of an approach to religious education (which continues to be developed) in the light of all the above. Its initial development was partly through an experimental curriculum development project (the Warwick RE Project) and partly through on-going work in RE that draws on further field studies of various kinds and relevant theory. Work up to 1997 is reported in *Religious education: An interpretive approach* (Jackson, 1997). Further developments are reported in *Rethinking religious education and plurality: Issues in diversity and pedagogy* (Jackson, 2004a: see Chapters 6 and 7) and in *Education and religious diversity: The interpretive approach in an international context* (Jackson, forthcoming). Although the work was designed originally as a contribution to ‘secular’ religious education in publicly funded schools in England and Wales, it has been applied within faith-based education (e.g., Coleman, 2005) and it is applicable internationally both to religious education (or its variants) and to fields such as intercultural education, citizenship education, values education and social studies, which incorporate studies of religious diversity (Council of Europe, 2007; Jackson, 2003, Chapter 1; 2004a, Chapter 8; 2004b).

Developing the Approach

Ethnographic research specifically on children, and the development of curriculum material associated with it, began at the University of Warwick in the 1980s (e.g. Jackson & Nesbitt, 1986) and continued through the 1990s (e.g., Jackson, 1989; Jackson & Nesbitt, 1990; 1993; Nesbitt, 2004). The Warwick RE Project was the curriculum branch of a research project entitled ‘Ethnography and Religious Education’ funded by the Economic and Social Research Council (ESRC Project

Reference number R000232489). It is important to point out at the outset that the main pedagogical methods and principles associated with the project are not inextricably bound up with ethnography but are associated with theory from various sources in the humanities (e.g., philosophy and cultural history) and social sciences (especially social or cultural anthropology) and with methodology that is influenced by hermeneutics. The hermeneutical method is the key element, and it can be applied in the absence of ethnographic fieldwork.

The aims of the project included increasing knowledge and understanding of the 'transmission' of religious culture to children and young people within families of four religious traditions in Britain using ethnographic methods; developing a theoretical framework for transposing ethnographic sources from the project into religious education material; and developing books for teachers, drawing on the project's theoretical work in religious education. The first aim was achieved through a series of ethnographic studies of children from different religious backgrounds (See Nesbitt's chapter above and e.g., Nesbitt, 1995a and b; 2004, Chapters 3 and 5). The theoretical background to the project plus an account of wider possibilities for the approach (aim 2) were published as *Religious education: An interpretive approach* (Jackson, 1997), while the third aim was achieved through the publication of the Warwick RE Project. The theoretical work developed during the ESRC study raised issues of *representation, interpretation and reflexivity* (Jackson, 1997).

Representation

The approach is critical of Western, post-Enlightenment models of representing 'world religions' as schematic and homogeneous belief systems, whose essence can be expressed through a series of propositions or doctrinal statements (Said, 1978; 1993; Smith, 1978). The project does not abandon the use of the language of 'religions', but is critical of approaches which essentialise or stereotype them. The approach is equally critical of simplistic representations of cultures and of the religion/culture relationship. Recent debates in social/cultural anthropology and other social sciences are used to develop more sophisticated models of the representation of cultures, cultural processes and ethnicity (e.g., Barth, 1981; Baumann, 1996; Clifford, 1988; Eriksen, 1993; Geertz, 1973; Said, 1978). Cultures are presented as internally contested and fuzzy edged, while individuals are seen as capable of contributing to the reshaping of culture through making personal syntheses which might utilise various cultural resources, including their own ancestral traditions. Thus 'culture' is seen as both a possession and a process.

A model for representing religious material is developed which encourages an exploration of the relationship between individuals in the context of their religious and cultural groups (Tajfel, 1981) and to the wider religious tradition. The tradition is seen as a tentative but contested 'whole', and it is recognised that different insiders (and outsiders) might have varying understandings of the nature and scope of the Hindu or Christian traditions, for example. The model offers a view of religions which acknowledges their complexity and internal diversity, including their varying

interactions with ‘culture’. The personal element in religions is emphasised, with religion being presented as part of lived human experience. The approach is not relativistic in relation to truth, aiming for a procedural epistemological openness and acknowledging varying and often competing truth claims (e.g., Jackson 1997, see pp. 122–126).

Interpretation

In developing a methodology for interpretation, some of the claims of ‘classical’ phenomenology of religion as interpreted by some writers on religious education were rejected (Sharpe, 1975), especially the view that it is possible to put one’s presuppositions into ‘parentheses’ and that the use of empathy is straightforward. The interpretive methodology does have some elements in common with Jacques Waardenburg’s ‘new style’ phenomenology (Waardenburg, 1978), but it relates closely to work in recent interpretive anthropology. Rather than asking learners to leave their presuppositions to one side, the method requires a comparison and contrast between the learner’s concepts and those of people being studied. The approach requires a backwards and forwards movement between the learner’s and the other’s concepts and experiences. Sensitivity on the part of the student is regarded as a necessary condition, with empathy only being possible once the terms and symbols of the other’s discourse have been grasped.

The application of the model of representation outlined above requires moving back and forth between individuals in the context of their groups and the wider religious tradition. The work of the American anthropologist Clifford Geertz (e.g., 1973; 1983) influences the method. However, some aspects of Geertz’s work are criticised, such as his lack of direct involvement of insiders in editorial roles and his sparing use of quotation from his interviewees—examples of Geertz’s lack of attention to issues of power (Clifford, 1988; Crapanzano, 1986).

As Wilna Meijer has pointed out, the approach is not only relevant to studies of contemporary religion; it can also be used ‘historically’, in revisiting lost or forgotten aspects of tradition and facilitating young people’s reappraisal of it. (Meijer, 2004). Her observation is consistent with the project’s approach to ‘edification’ (see below under reflexivity).

The interpretive methodology of the project was also influenced by the project team’s experience of ethnographic fieldwork (see Nesbitt, 2004 and Nesbitt’s chapter above). Studies of children from different religious backgrounds in Britain stimulated methodological reflection and were used as a primary source for curriculum development.

Reflexivity

A number of issues concerning reflexivity—understood here as the relationship between the experience of students and the experience of those whose way of life they are attempting to interpret—were raised by the project’s ethnographic

methodology and applied to religious education. Three aspects of reflexivity were identified as applicable to religious education. First, learners are encouraged to review their understanding of their *own* way of life (edification). Secondly, they are helped to make a constructive critique of the material studied at a distance; and thirdly, they are involved in reviewing their methods of study. Clearly, the more the teacher is aware of the religious and cultural backgrounds of students, the more sensitive and focused the teaching can be. This approach also requires methods that allow students to gain insight from their peers and to be able to examine different ideas of truth held within the classroom. The 'content' of RE is not simply material provided by the teacher, but includes the knowledge and experience of the participants and an interactive relationship between the two. Teachers working with children from diverse backgrounds need the skill to involve children directly in designing and evaluating methods of study.

Edification

One of the key aims of religious education, as understood in the English and Welsh curriculum, is to help pupils to reflect on their studies of ways of life that are different from their own in some ways. It is illuminating that anthropologists have written about how their studies of others have prompted some form of re-assessment of their understanding of their *own* ways of life (e.g. Leach, 1982, see p. 127). The term 'edification', adopted from the American philosopher Richard Rorty, was used to describe this form of learning (Rorty, 1980). This concept has some features in common with Michael Grimmitt's idea of 'learning from' religion but is not identical to it (see Grimmitt, 1987, p. 225; Jackson, 1997, see pp. 131–132).

This reflexive activity is not easy in practice to separate from the process of interpretation. Interpretation might start from the other's language and experience, then move to that of the student, and then move back and forth between the two. Thus the activity of grasping another's way of life is inseparable in practice from that of pondering on the issues and questions raised by it. Such reflexive activity is personal to the student and teachers cannot guarantee that it will happen. They can, however, ensure that such activity is not stifled and can provide structured opportunities for reflection. It is also the case that making this type of connection often helps to motivate students to participate more fully in RE. As Harold Loukes found in the 1960s (Loukes, 1961), and as Kevin O'Grady has demonstrated in his action research with secondary pupils in the north of England (O'Grady, 2005), a religious education disconnected from pupils' own questions and concerns is very likely to fail to engage and to motivate them. Whatever differences there might appear to be between the student's way of life and the way of life being studied, there may also be common features or points of contact or overlap. What might appear to be entirely 'other' might link with one's own experience in such a way that new perspectives are created or unquestioned presuppositions are challenged. Edification need not only result from studying religions or cultures other than one's own.

As Wilna Meijer has noted (see her chapter above), the study of *one's own* ancestral tradition, in religious or cultural terms, can also give new insights in re-examining one's sense of identity. The anthropologist Barbara Myerhoff demonstrates this very well in her study of elderly people in a Jewish community in the USA, showing how her academic studies re-awakened her own interest in questions of Jewish identity (Myerhoff, 1978). In the case of religious education, young people might see religions, including the one of their own history, from a new perspective. Ethnographic source material, plus data from locally conducted studies, could provide a basis for this, as could historical material (whether from local or wider sources).

Being edified by studying religious material does not imply *adopting* the beliefs of followers of that religion. It does imply recognition of the similarities and differences between all humans and of the inherent relationship between the identity of each person and the manifestation of differences. Moreover, it builds upon a genuinely positive attitude towards diversity, seeing the meeting between people with different beliefs and cultural practices as enriching for all, and seeing individual identity as being developed through meeting 'the other'. 'Recognition' in this sense can lead to a more positive approach to multi-cultural societies, both at the individual level and from the perspective of the state, leading to an active accommodation of differences, while upholding and strengthening shared values and a common human identity.

Constructive Criticism

Reflexivity involves being able to engage critically with material studied. The management of such critical work is a sensitive pedagogical issue, especially in pluralistic classrooms. Criticism can also be applied fruitfully to method. Just as researchers should spend time reflecting on the effectiveness and the ethics of the methods they have used, so a critique of the RE methods should be part of its content. This methodological self-awareness can reveal issues of representation and can also stimulate creative ideas for improvement, in the presentation of findings to others, for example. Methodological reflection can also help students to become more aware of bias in the techniques used in other forms of presentation. Once they have engaged in some methodological self-criticism they might better undertake a critique of the representation of Islam in popular newspapers, for example.

The Warwick RE Project

The first educational outputs using the interpretive approach were books for pupils and teachers, known collectively as the Warwick RE Project, and developed from ethnographic field data and theory. Project team members had various roles, with some members taking on more than one. These included supervising and conducting ethnographic research and curriculum development; contributing

theoretical and methodological ideas; arranging meetings to provide an on-going review of progress; and contributing to the project's writing programme. The main role of the ethnographers was to conduct field studies and disseminate findings. Ethnographers liaised with the curriculum developers providing them with field notes, audio-taped interviews and slides and introducing them to selected families in order to extend their involvement with the project. Ethnographers also provided background briefing material for use by curriculum developers in writing books for pupils or teachers' resource books. The curriculum developers were introduced to the project's methods and theory and to ethical issues such as confidentiality. The co-ordinator of curriculum development liaised with all participants, organising limited trials of material in schools (Everington, 1996a, b), and contributing to the project's writing programme (Everington, 1993a, b; Jackson, Barratt & Everington, 1994).

The project team aimed to find ways to connect the experience of children in communities with the practice of RE in schools. Our ideas and materials *could* have been developed for in-service training of teachers or for use in initial training. However, we eventually settled for a curriculum project. The key goal was to *experiment* with applying some of the theoretical ideas and some of the ethnographic data from our studies in books for children and young people, rather than giving comprehensive coverage to religions, which was not feasible given the project's budget and time scale. The following is a brief summary of the content and pedagogical approach of the texts written for pupils.

Pupils Aged 5–7 Years

For 5–7 year olds, each children's book focuses on a single child from one religious group. The stories of two Christian girls, a Jewish boy, a Muslim girl and a Buddhist boy are based on studies conducted by members of the project team, each illustrating how children learn through participation in religious activities within the family (Barratt, 1994a, b, c, d, e). There are two versions of each pupil text, one printed in the *Teacher's Resource Book* to be read by the teacher and used as a basis for discussion (Jackson, et al., 1994), and a simpler text to be read by pupils reproduced in the children's books. The process of interpretation is also introduced in the *Teacher's Resource Book* which helps children to relate concepts, feelings and attitudes encountered in the stories to their own language and experience. Terms, actions and objects identified from the pages of the story books are grouped under general headings as 'key ideas'. These general concepts suggest areas where bridges can be made from pupils' experience of life to the experience of the children introduced in the story.

'Edification' is introduced through raising questions in relation to the pupils' own experience. These explorations and discussions aim to broaden children's horizons and stimulate thought and reflection. The bridging discussions include ideas for encouraging children to make their own contributions spontaneously. Children are encouraged to explore their own ideas, emotions and attitudes, and

to recognise similarities and differences between their own experience and that of children in the stories.

Pupils Aged 7–11 Years

With 7–11 year old children, the focus is on several young people associated with various Christian membership groups, and the emphasis moves to learning and reflection in groups associated with the family's religious practice. The book for 7–9 year olds introduces children from Salvation Army and United Reformed Church backgrounds (Barratt & Price, 1996a). The discussions cover topics from ethnographic source material and include 'joining', 'learning', 'believing and worshipping', 'prayer and praise', 'the Bible', 'living as a Christian', 'sharing' and 'caring for others' (Barratt & Price, 1996b). In the book for 9–11 year olds, three children from families with different ethnic histories are introduced, from Roman Catholic, Baptist and Pentecostal backgrounds (Everington, 1996c). Readers encounter each young person taking part in activities within the family and in different parts of their church communities. The material is arranged under the headings 'learning', 'preparing', 'responsibilities' and 'traditions'. Extracts from interviews are combined with an author-narrated text, illustrated with original photographs. Links are made to other parts of the Christian tradition and the *Teacher's Resource Book* provides advice on method and offers information and activities for pupils, moving between the language and experience of the children portrayed in the text and those in the classroom (Everington, 1996d).

Pupils Aged 11–14 Years

For 11–14 year olds, the emphasis is on engaging with the comments and reflections of young people linked to various groups within the religions. Each book features four British teenagers, two girls and two boys. *Muslims* focuses on young Muslims with a Pakistani family ancestry (Mercier, 1996), *Christians* introduces young people with Church of England, Greek Orthodox, Quaker (Religious Society of Friends) and 'New' Church backgrounds (Robson, 1995), while *Hindus* introduces young people whose lives relate to various aspects of Hindu tradition and whose family ethnic background is Gujarati Indian (Wayne, Everington, Kadodwala & Nesbitt, 1996). As well as providing general information about the young people and their interests, each text concentrates on aspects of their religious life, and includes extracts from interviews with them and photographs taken during fieldwork. The books cover topics related to religious practice in contemporary Britain, all suggested by the material collected during fieldwork.

Pupils are provided with activities related to each unit of work. '*Making it clear*' tasks check that students are familiar with the basic facts and ideas featured in the unit. '*Working it out*' activities help students to relate material from one of the

three 'levels'—individual, membership group or tradition—to material drawn from another 'level' so that each sheds light upon the other. *'Building bridges'* activities ask students to draw from their own experience or ideas in order to interpret material presented. Students are asked to focus on personal knowledge and experience for comparison and contrast with material from the religious tradition. The familiar is used to make sense of, or to gain insights into, the unfamiliar.

'Thinking it through' activities encourage students to use material from a religious tradition as a stimulus to reflect upon matters of personal concern. As the teachers' notes state, the aim is 'to encourage students to examine or re-examine aspects of their own understanding in the light of questions, issues or experiences which are encountered in particular religious traditions, but which also have universal significance' (Wayne, et al., 1996, p. 4)

The books had a wide distribution and usage, and are now sold out. All who were involved in the Warwick RE Project probably had some mixed feelings about the books and about the labour intensive experience of producing them. However, a great deal was learned through the exercise, and the materials have been widely used.

Developments of the Interpretive Approach

The Warwick RE Project illustrates a particular application of the interpretive approach. Whereas its pedagogical method started from a consideration of individual young people portrayed in the curriculum texts in the context of their families and communities, the interpretive approach can start at any point on the hermeneutic circle.

Starting with Key Concepts

For example, instead of starting with portrayals of particular individuals, the approach can begin with an overview of a tradition dealing provisionally with some of its key concepts, followed by a consideration of specific examples of individual or group life. This approach was used in writing a book for teacher education students and teachers entitled *Approaches to Hinduism* (Jackson & Killingley, 1988). The book starts with an overview of the Hindu tradition, but the limitations of such summaries are pointed out to readers. A treatment of some specific elements from the tradition follows, using a series of case studies of individual Hindus based on ethnographic or biographical studies. The intention was that the introduction should make the case studies intelligible, while the case studies provided non-generalisable details of religious life. The latter point up the limitations of the overview and extend an understanding of the Hindu tradition. There is scope for further developments along these lines giving closer attention to issues of interpretation and reflexivity.

Starting with Students' Questions and Concerns

The approach can also start from the questions and concerns of students, move to individuals or groups within a tradition or to general ideas from a tradition, and then back again to the student. Two examples will be given here.

Case Study One: Buddhism in the Lower Secondary School

The first is a project conducted by Amy Whittall with lower secondary students from a school in Birmingham who had previously done very little on Buddhism (Whittall, 2005). All activities covered at least one of the elements of representation, interpretation and reflexivity. As students had little prior knowledge, they were encouraged to raise questions about Buddhism, and were given time to discuss these in groups and to explain why they were of interest. The groups focused on two questions they would like to address. They were then asked to record their tentative answers to the two questions drawing on any previous knowledge. The answers formed their hypothesis.

Students were then given time in lessons to decide how they would investigate the answers to their two questions. They were able to choose the methods used, the resources needed, the tasks for individual group members and the homework set. As part of the process, students were required to be involved in a dialogue with Buddhist sources. Some groups wrote to Buddhist communities and then analysed the replies in comparison with 'textbook answers'. Other groups spoke to Buddhist children in other year groups in the school. All groups were encouraged in each lesson to discuss their work with students who were investigating different aspects of Buddhism. This helped them to build up a bigger picture of the tradition into which their questions fitted as a part (i.e. *representation* and *interpretation*).

The reflexivity element was achieved when students wrote their final reports. They were asked to consider if they had learned anything about *their own* ideas from their studies and, in particular, whether they could see any connections between their own ideas and those of Buddhism. One student, for example, considered how the idea of *nirvana* in Buddhism and that of paradise in Islam appeared similar in some ways, but not others. Finally, students were encouraged to review their hypothesis. They were asked to analyse how accurate they had been in their initial ideas and to try to explain this. Had they, for example, drawn on knowledge about other faiths and applied this to Buddhism? Had they made correct or incorrect assumptions? The process enabled students to analyse how they had used their knowledge of religious diversity and applied this to one specific tradition.

Throughout this work, students were involved in a process of moving inside and outside of the religious tradition, making conceptual links and drawing on previous knowledge (*representation* and *interpretation*). Every individual was challenged at a level appropriate to them so that the work met the varying academic needs of the students. Students gained an emergent picture of the Buddhist tradition as well as engaging in a process of comparison between ideas from Buddhism and their own

ideas. Classroom work utilised the skills of analysis, reflection, and investigation and students showed increased motivation through their individualised learning and hermeneutical activities.

Case Study Two: Aspects of Islam

This example shows a development of the interpretive approach through the use of action research in a secondary school in Sheffield in the north of England (O'Grady, 2005). A group of 12–13 year old students worked together with Kevin O'Grady, a teacher/researcher, to plan and assess a topic on Islam. Meanwhile, the teacher/researcher also gathered data on factors in their motivation to learn. The school had almost no Muslim students despite its location in a large, culturally diverse city and the students had little prior knowledge of Islam. Before the teaching started students added their own questions to the pre-set school scheme of work and also wrote down their preferences for styles of learning.

The first few lessons were planned taking these ideas into account, and at two further points in the topic the consultation was repeated. Students additionally reflected on what they had learned from the lessons. The teacher/researcher kept his own log of observations throughout. Towards the end of the project the students were interviewed in small groups about the process as a whole. There was evidence that involving students as collaborative researchers and planners of work had increased their motivation.

The key concepts of the interpretive approach were used as follows. With regard to *representation*, students became aware that stereotypes of Islam, as found commonly in the media, for example, did not match the diversity of the religious lives of real people. In relation to *interpretation*, students learned how to compare and contrast Islamic concepts with ideas from their own experience, and explored some of these similarities and differences through drama. With regard to *reflexivity*, bringing students' own questions and ideas into a dialogue with the Islamic material prompted students to reflect on their own values and cultural assumptions, generating some genuine intercultural understanding. There was no face-to-face dialogue, since no Muslim students were present in the class, but there was still a 'dialogue with difference' that built self-awareness and cultural understanding, as the following example shows.

In a lesson about family life, the students formed drama groups and most prepared sketches about what they believed to be important in family life. One group researched Islamic beliefs about family life from a variety of texts and noted five key factors on a poster for display. Each sketch was performed and then discussed, and the students indicated points of contact with the poster about Islam. There was a discussion about extended families. Students shared their own experience of traditional working class patterns of extended families in the local area, and how they valued especially the care for the elderly that this provided. In comparing this with their earlier assertions about Muslims 'sticking together in large groups in one area', the students reappraised their view. Muslims became less exotic through

the experience of cultural comparison. Several interview responses illustrated the students' experience of increased self-understanding through the interpretation of Islam:

The link is because, when we learn about different religions, you find out who *you* are...whether you're Christian, or some people don't want to be different things...you find out who you are inside.

We learn about Muslim life, then about whether it relates to us, in our life.

In Islam, they have set rules, like you should always help your elders, and it's made people think that we should always help our parents, too.

Another key element of reflexivity in this example is the importance given to the students' own voices at the centre of enquiry. Other examples of developments and adaptations of the interpretive approach, and its application in an international context, are given in Jackson, forthcoming. An example of a dialogical approach, developed from the interpretive approach by Julia Ipgrave, is given in Jackson, 2004a, Chapter 7.

Teacher Training

There is no space here to deal in detail with issues of teacher training, but some general points can be made. Teachers using this approach could be from any religious background or none. However, in terms of attitude, a necessary condition would be sensitivity and a positive attitude towards difference and the ability not to impose particular views upon others. Clifford Geertz would expect a similar sensitivity and openness from a cultural anthropologist studying another cultural scene (Geertz, 1983). I have called this quality 'epistemological openness', allowing pupils to enter debates and enabling them to position *themselves* (Jackson, 2004a). This is not a relativist position and leaves questions of religious truth open to debate (Jackson, 1997, see pp. 122–126).

Teachers would also need to treat pupils as co-learners, and to give them some agency in selecting particular topics or designing and refining methods of study (see, the discussion of O'Grady's work in Jackson, 2004a, Chapter 6 and of Ipgrave's work in Jackson, 2004a, Chapter 7; see also Jackson, forthcoming).

Teachers would need some education in the study of religions that introduced them to the debates about the representation of religions in Western literature since the European Enlightenment. This would not need to be extensive, so long as it was on-going. Teachers would need to experiment with ways of representing religions that emphasised the personal elements in religion and challenged the idea of religions as homogeneous systems of belief. They would also need a similar flexibility in approaching debates about 'cultures', 'ethnic groups' and 'communities'. Access to some small scale, local ethnographic studies would be

an advantage (see, for example, some of the studies reported above by Nesbitt, and in Nesbitt (2004) and by Østberg in her chapter below) or to autobiographical accounts and personal stories from members of religious groups. The important point is to learn principles rather than seek mastery of large amounts of data in a short space of time. The approach lends itself to learning *with* students in a spirit of joint research. Some knowledge of the cultural and religious backgrounds of their classes would also enhance teachers' sensitivity.

Teachers would also need practice in comparing and contrasting their own concepts and past experiences with related but (often) different concepts and experiences found in concrete examples of religious practice. They would then need to practise this 'bridging' skill with pupils. To enhance the bridging process, teachers would need to work with pupils in identifying the issues that concern them. Teachers need to use their professional judgement in relation to particular classes and the social circumstances of the school in deciding whether to start with explorations of students' own concerns and values (see, for example, the discussion of Eriksson's work in Jackson, 2004a, Chapter 6) or with overt material from religious sources (as with the Warwick RE Project materials or with an overview of key concepts).

Conclusion

This chapter has outlined an interpretive approach to religious education, illustrating it specifically through the example of the Warwick RE Project, but also indicating wider applications of the approach. The approach sees religions as dynamic and changing, and as a series of relationships rather than rigid and homogeneous systems of belief. Understanding is increased through studying the cases of individuals, in the context of their religious and cultural groups, in relation to various constructions of the wider religious tradition. The approach also requires the student to use familiar or analogous concepts and experiences in a process of comparison and contrast between one's own worldview and that of others being studied. The source material for such studies can be of various kinds, but ethnographic studies that point up the complexity of religious and cultural interactions and challenge stereotypes are one particularly useful source.

The interpretive approach includes the possibility that students might have their own views deepened through the study of other positions, whether outside or related to their own traditions. It also offers opportunities for students to apply their critical faculties skilfully and sensitively to material studied and to engage in methodological self-criticism and creative approaches to presentation, using the arts for example. The approach also recognises that students' own experience can and should be part of the subject matter of religious education, and that there is the possibility of developing new ideas through the interaction of pupils from different backgrounds. Pedagogically, the more aware teachers are of beliefs and values embedded in the religious and cultural experience of students, the more they can take account of pupils' concerns and can provide teaching and learning situations which are designed to foster communication between students from different backgrounds.

The interpretive approach is inclusive of participants from different religious and non-religious backgrounds, providing the opportunity for different religious and cultural positions to be understood in a methodologically sound, self-critical and non-relativistic way. It also acknowledges the potentially transformative character of such studies, while equally recognising the limited and partial effect of schooling in the overall experience of the young. There is scope for developing the interpretive approach in different ways, starting at any point on the hermeneutic circle. In countries where there has been deep ethnic or religious division it might especially be appropriate to begin with students reflecting on their own traditions, presuppositions and attitudes towards others. There are also possibilities for developing the approach in relation to the interface between religion and other curriculum fields such as values education, citizenship education and intercultural education.

DYNAMICS OF RELIGIOUS CULTURE: ETHOGENIC METHOD

Mary Elizabeth Moore

Candler School of Theology, Emory University, USA

Introduction

The study of religious cultures is always done with a purpose—to preserve or transform the cultures studied, to understand a misunderstood community, to address issues of particular concern to scholars or religious leaders, or to contribute to a body of research on a particular topic. What, then, is the purpose of the Ethogenic research introduced in this chapter? It can have any of the specific goals named above, but its underlying purpose is *to study the dynamics of religious formation and transformation, and patterns of educational and religious practice, in culturally diverse religious communities*. The concern is not so much with the qualities of a particular community at a moment in time, but with the processes by which communities construct, transmit, critique, recreate, and transform themselves and their members in relation to the larger world. The concern, further, is with diverse forms of culture—cultures shaped by ethnicity, age and generation, denomination, class, region and other cultural realities—and how these cultures teach, or shape and reshape human lives.

The purpose of this chapter is to explicate the Ethogenic method, providing conceptual rationale and methodological detail to guide future work. In twenty years of collaboration with others, I have studied religious life and education in ethnically diverse parishes and congregations, seeking to understand processes of formation and transformation, dynamics of religious culture, and future possibilities for religious and educational action. More particularly, I have used the method to study youth ministry in diverse Christian communities, changing functions of Sunday schools, urban ministries, and educational processes within congregations struggling with controversial decisions. Studies thus far include eight congregations of six ethnic groups in the United States and one in Africa; the eight also represent five Protestant and Roman Catholic denominations and traditions (Moore, 1993; 1998a; 1998b; 2001; 2003; 2004; Moore & Moore, 1993).

This research is challenging because religious communities are changing bodies, shaped and reshaped by cultural interactions within and beyond themselves. Some early research has simplified this task of cultural study by focusing on types and qualities of culture, or influences upon culture. Our Ethogenic studies add distinct contributions to this research. First, they contribute an emphasis on social interaction and movement to previous research on religious communities. Second, they contribute social complexity to studies of faith formation, countering individualistic and universal assumptions about developmental structures, community life, and moral principles, whether principles of justice or care. Our work focuses more on cultural particularities, recognising that some qualities are common to many cultures and some are not. Third, this research contributes to understanding and developing educational and religious practice within complex cultural and multi-cultural matrices. Such work is sorely needed, for cultural analysis of religion has grown slowly in the United States. In religious education, the movement toward analysing religious communities and schools has been especially slow, even when general educational literature on diversity was burgeoning (Armstrong & Barton, 1999; Banks, 1997; 2002; 2004; Banks & Banks, 1995; Beauboeuf-Lafontant & Augustine, 1996; Bowers & Flinders, 1990; Cajete, 1994; Gardner, 1993; 1999; Gay, 2000; Goldberg, 1994; hooks, 1989, 1994; Sleeter & Grant, 1987; Sleeter & McLaren, 1995; Wlodkowski & Ginsberg, 1995; Woyshner & Gelfond, 1997; Young, 1990).

A fourth contribution of Ethogenic research is to generate further research. Our early studies need to be replicated and expanded. They also need to be compared with other religious education research, much of which focuses on *diversity* in relation to social and religious patterns (Andree, Bakker, & Schreiner, 1997; Conde-Frazier, Kang, & Parrett, 2004; Foster, 1997; Foster & Brelsford, 1996; Heimbrock, Scheilke, & Schreiner, 2001; Hobson & Edwards, 1999; Jackson, 1997; 2002; 2004; Moore, 2001; 2003; Wright, 2004). Other comparative research needs to focus on *particular* religious and cultural communities (Boys, 2000; Hess, 1997; David Ng, 1996; Donald Ng, 1988; Østberg, 2002; Schuster, 2003; Wimberly & Parker, 2002). These bodies of work, enhanced by Ethogenic research, can contribute to richer religious and educational life, enhancing cultural sensitivity and intercultural, inter-religious understanding and practice.

Assumptions

In the light of earlier research, the challenge now is to deepen public understanding of cultural formation, entanglement, conflict, critique, and transformation. This requires honest exploration of culture, and the recognition that researchers are not clean slates as they enter cultural study. They bring assumptions grounded in their contexts and theoretical pre-judgments. Honesty about assumptions helps people hold diverse agenda together, discouraging hegemonic cultural claims and opening paths for more adequate research and deeper human understanding. It opens space for diverse researchers to influence one another in shaping religious and educational

practice. Further, honest discourse counteracts tendencies to isolate cultural diversity research into a few ethnic and interest groups, obscuring its relevance to religious education at large. I have framed the following assumptions in relation to faith communities, the focus of our research to date; however, the assumptions also apply to studies of schools and other communities.

The first assumption is that faith is understood and formed differently in diverse religious traditions, and even in diverse communities of one tradition. Such differences are often foundational, not merely superficial. Even if people worldwide have similar cognitive structures (sometimes assumed by psychologists and anthropologists), one can find what Victor Turner (1974) calls 'wide diversities of cultural experience' (p. 3). The assumption of diversity seems obvious, but many efforts to regularise public religious practice, or Christian practice across a denomination, reveal hegemonic assumptions. Many religious leaders develop theories about how faith is formed and apply these theories in every situation. The result is inadequate—an application of one educational approach across quite diverse communities.

A second assumption is that differences among faith communities are as important to designing education as any generalisable features that may exist. Differences can be gifts to the broader human community, such as the emphasis in many Native American communities on revering creation, or in African-American communities on liberation. Such gifts are not cultural curiosities; neither are they the same in every community, not even in every Native and African-American community. They do reveal critical parts of the human story, however. Cross-cultural sharing reveals these gifts and their nuances, sometimes even helping people discover similar gifts within themselves. Native American reverence for creation often inspires reverence in others; Black stories of deliverance encourage others to persist in social critique and hope.

The point of view offered in this chapter is that human nature is pluralistic. We are not all of one kind, but we do have connections with one another so that one person or culture can influence others. This idea corresponds with Raimundo Panikkar's (1982) analysis of the archetype of the monk, or the human quality of monkness. This human quality may be found in many people, but it takes vivid and concrete form in monastic religious communities. Monks who live in these communities embody the quality of monkness, thereby awakening these qualities in others. Monks are not archetypes to be imitated, but they reveal the archetype of monk and call it forth from others. Might we similarly refer to archetypes of earth-relatedness and liberation-seeking? While Ethogenic research is not aimed at identifying or arguing for archetypes, the spirit of this question suggests an important perspective on human differences and similarities. To tap cultural uniqueness, both on the surface and deeply embedded, education needs many forms—forms that address people in their uniqueness and enable them to address one another.

The third assumption is that faith communities are complexly related to religion and culture. Much work in modern religious education has focused on the unique lives of individuals, but studying communities uncovers larger social patterns. Such patterns are embedded in a community's life, where beliefs, values and

practices form a kaleidoscope of colour. No shape or colour can be removed without distorting the larger picture. Communities are multi-faceted; consistent with Victor Turner's (1974) description of human imaginative and emotional life as 'always and everywhere rich and complex' (p. 3; cf: Ammerman, 1997). Indeed, this complexity interplays with the entire social fabric, a fact often ignored by religionists and anthropologists. Victor Turner, for example, had no early interest in religion. Then he realised that he could not understand a culture without its religious ritual: 'Eventually, I was forced to recognise that if I wanted to know what even a segment of Ndembu culture was really about, I would have to overcome my prejudice against ritual and start to investigate it' (Turner, 1974, p. 7).

Culture also influences religious life; thus, one cannot understand a community's religious life or religious education without understanding the broader culture, including the structures, interaction patterns, shifting movements, and values of a society. Again, Turner (1974) discovered such connections among the Ndembu people of north-western Zambia (Central Africa), for Ndembu rituals were performed in relation to social crises (see p. 10). The *Isoma* ritual, for example, was to help a woman with a history of miscarriages and stillbirths to bear children. Because childbirth problems were attributed to the woman's failure to honour her deceased mother or maternal, female ancestors, the problem was understood communally; the woman had violated the social order. Rituals were performed to help the woman *and* to restore social relationships (see pp. 11–13).

Another example of the social dimensions of ritual is the Ndembu twinship ritual, or *Wubwang'u*. Because procreation was valued in Ndembu society, twins were seen as a blessing, but milk and food were not abundant, so twins were also seen as a curse. The community, with its responsibilities for childcare, shared the blessing and misfortune. The *Wubwang'u* ritual thus charged the community in its role (see pp. 40–45). In so doing, the ritual acknowledged the blessing-curser contradiction and other contradictions in Ndembu life, such as male and female, matrilineal descent and patrilineal living patterns, sterility and fruitfulness, and sexual disordering forces and social order (see pp. 78–79). These examples reveal the rich textures of a community's life and its complex relationship with religious and cultural values.

The fourth assumption is that human beings are interconnected, mutually influential with one another and their common physical environment. Much work on education and faith formation has heretofore focused on universal qualities and processes in individuals. This is particularly true in moral and faith development research and, to some extent, in writings on spiritual formation. Similarly, many psychologists, sociologists and anthropologists have based their theoretical systems on universalist assumptions. Consider, for example, Sigmund Freud, Carl Jung, Talcott Parsons, Claude Levi-Strauss, and Mircea Eliade. Particularly influential in religious communities have been the moral development theories of Lawrence Kohlberg and Carol Gilligan and the faith development theory of James Fowler. My purpose, with the Ethogenic method, is not to assume, discover, or prove the existence of universal principles and cognitive structures. The assumption, rather,

is that cultures and individuals are part of a human community linked in visible and invisible ways, thus creating mutual influence.

To claim universal patterns or structures is misleading. It can be useful to explain why people in diverse cultures are similar, as in patterns of parental love or patterns of human growth from childhood to adulthood. The problem is that universal patterns are inevitably superimposed on all experience, and deviations are regarded as exceptions or, worse, aberrations. A more fruitful approach to human commonalities is to recognise interconnections in the human family—through procreation, migration, cultural exchange, and the sharing of similar physical qualities and a common earth. Such interconnections account for common patterns and structures without reference to universals. Indeed, the patterns and structures are often generalisable because people influence one another through historical and spatial relationships. Human commonalities are thus explained, not by eternal givens, but by the influence of dynamic, interactive relationships.

Ethogenic Method: Listening to Stories

In the Ethogenic method, the goal is to attend to a community's story—the complexities of its everyday life, revealing a dynamic interplay of beliefs, values, and practices. This involves close listening and observation of community life. The method is shaped by ethnographers' participant observation and the Ethogenic method of Rom Harré and his colleagues. In participant observation, the basic ethnographic tool of anthropologists, researchers engage in the life of a community over time, carefully describing what they see and hear. During this period of research, they generally avoid roles and relationships that impede their ability to observe community life in its fullness. Robert Bogdan (1972) defines participant observation phenomenologically as: 'research characterised by a prolonged period of intense social interaction between the researcher and the subjects, in the milieu of the latter, during which time data, in the form of field notes, are unobtrusively and systematically collected' (p. 3). Our research has been engaged in such intense, prolonged interaction in congregational settings, using field notes to gather observations. Further, the research involves checking and discussing our findings with communities that are studied, thus following the reciprocal ethnography of Elaine Lawless (1994) and seeking the mutual influence and empowerment that she describes (1994; 2001).

The research is also Ethogenic. Rom Harré and others developed the Ethogenic method as an alternative to positivist research in the social sciences (Harré, 1976; 1979; Harré & Langenhove, 1999; Harré & Moghaddam, 2003; Harré & Secord, 1972; Smith, Harré, & Langenhove, 1995). Harré, a philosopher of the social sciences at Oxford University, was critical of the artificiality, supposed objectivity, and limited scope of much research in psychology and sociology. In response, he developed a research method based on the naturalistic observation approach of Niko Tinbergen (1972) and Konrad Z. Lorenz (1981; Lorenz & Leyhausen, 1973). Tinbergen and Lorenz studied animals in their natural settings

(ethology), observing, describing, analysing and explaining their behaviour. Harré and others developed similar research with humans, observing people in the natural complexity of daily life situations. In addition, the Ethogenic method includes listening to people explain their behaviour, drawing upon the linguistic capacity of humans to explicate the origins and reasons for their actions. Researchers assume that 'some insights into the genesis of that behaviour can be obtained by studying the accounts that are given by the actors themselves' (Harré & Secord, 1972, p. 152).

Note that the emphasis of Ethogenic method is to discover influences and origins of social behaviour and to understand the dynamics of social interaction, more than to graph the life of a people. The method thus fits within the genre of ethnography that focuses on dynamic social interaction. This is a subtle point. Although all ethnographers care about social dynamics, some who study religious communities have sought primarily to identify and essentialise enduring patterns of community life, rather than to study complex interactions and transformations over time.

Our research is described here as Ethogenic (in the family of ethnography) because researchers focus on complexities, interactions, and transformations. The approach includes observing a community's internal interactions and its interactions with the larger society, the earth, and the Holy. It also includes gathering accounts from individuals and groups in the community, listening to their different perspectives on community life. These accounts are gathered in various ways, including formal interviews, observations, questionnaires, and informal conversations. Then, a team negotiates the complexities and differences to discover the community's story, with all of its diversity. Many participants offer these accounts and a few community representatives help negotiate the accounts into a whole. The Ethogenic approach can thus be described as: narrative, inter-subjective, flexible and open, unobtrusive, and self-conscious.

Narrative

The emphasis of our Ethogenic research is on listening to and observing people's stories, inviting the community to be storyteller and teacher. The research team spends time in many aspects of community life, interviewing and observing as stories unfold. After each interview or observation period, the researcher records visual observations and verbal exchanges as thoroughly as possible. We use a tape recorder when we can do so without disrupting natural interactions.

Three aspects of this narrative approach receive particular attention. One is gathering stories from many people—young and old, females and males, leaders and followers, individuals and small groups. A second aspect is observing multiple stories of community life—social interactions, symbols and liturgies, community action. A third aspect is weaving the several stories into one communal story. In so doing, researchers assume that all the accounts are true accounts, representing some part of the community's experience or interpretation. Rather than searching for the *real* story behind so-called distorted accounts, we search for a communal story that represents collective truth, including diverse, sometimes conflicting, experiences and perspectives. For these reasons, representatives of each community help

negotiate the overarching story before public sharing. The negotiating process is an effort to bring mounds of data into a truth-telling narrative, but not a homogenised one. The community's story is intended to be a picture of the whole, including disputations. Further, we involve diverse people in this negotiation process to avoid domination by one person or group. Even so, the final story will only be an approximate picture of the community's life at a moment in time, inevitably influenced by the community observed, researchers, and negotiators. When our research team analyses the 'final' narratives, we recognise these ambiguities.

Inter-Subjective

Another quality of the research is inter-subjectivity. As stated above, the effort is not to find an objective truth behind a collection of subjective stories. The attempt is rather to view every situation and person as a subject with a story to tell. Every account offers meaningful perspectives on a community's life, though individuals construct their accounts according to their unique filters, needs and desires. Because the view of each person reflects his or her experience and understanding of reality, each story must be woven into the community's story. Researchers attend to these various accounts, knowing that no one perspective will be true and others false. An actual event is only accessible through multiple subjective accounts, which are negotiated to yield a more adequate community account (Harré, 1976; 1986; Harré & Moghaddam, 2003; Harré & Secord, 1972; cf. Josselson & Lieblich, 1995; 1996).

To gather these several accounts, the research method includes collecting life history material from several members of a congregation. Robert Bogdan (1972) recognises that the value of life history is to reflect a person's view of the world and of his or her life. This is the principal interest of a participant observer (see p.69), as it is of an oral historian (Gluck & Patai, 1991; Ritchie, 2003). Each person, according to Bogdan, has a unique career, including social roles and definitions of self and world. The person will therefore interpret community life both through the community's collective experience and through his or her unique career and individualised meanings. The negotiation of many meanings will give a fuller picture of the whole.

These ideas are compatible with the symbolic interaction school in the social sciences that has influenced Ethnogenic theorists, such as Harré, and phenomenological ethnographers, such as Bogdan. In both methods, attention is given to the interpretive processes that people use to describe and explain events. Since all concrete experience is filtered through an interpretive process, the interpretations or meanings that people give to a situation give access to that situation, though inevitably an incomplete access.

To be inter-subjective, our research teams listen to many different individuals and groups in a congregation. They also listen to one another, working in multicultural and religiously diverse teams. Collaboration minimises the tendency to shape observations and analysis according to the visions and biases of one scholar.

Though one author often serves as the primary analyst and writer of a community's story, that person regularly tests findings and narratives with the research team and members of the community.

Flexible and Open

To say that the Ethogenic research method is flexible and open sounds somewhat vague, for no research is completely inflexible and closed. In fact, the purpose of research is to make new discoveries, which means that research is by definition open to new knowledge. What is important to our Ethogenic research is that the research design itself is flexible, and is sometimes changed in the process of doing a study. Indeed, this is characteristic of participant observation research in which situations are allowed to guide research method (Bogdan, 1972, see pp. 18–19; cf. Bogdan & Bicklen, 1982; Taylor & Bogdan, 1984). In our research, we develop a detailed research design in advance, but make changes as situations shift. For example, interviews are oriented around pre-established questions, but an interviewer may change the questions or simply listen when an interviewee seems eager to share something else.

Another example of flexibility and openness is the conscious effort of our research teams to postpone hypothesising about religion, education, and culture. This clears space to generate hypotheses and theoretical models in the field and to discover variations in community life (Bogdan, 1972; Taylor, Bogdan, & Lutfiyya, 1995). The intention is to suspend pre-conceived beliefs and categories as much as possible, and to be as open as possible to new ideas and categories as they emerge. Although the research does not begin with theories and hypotheses, it does begin by asking researchers to identify pre-conceived beliefs and attitudes regarding the subject and subjects under study. It also includes periodic checks when researchers identify and record their emerging perspectives and hypotheses. In these ways, we seek to be conscious of values, prejudices, and prejudgments, and eventually to analyse them, but not to be led by them into premature theory building.

Unobtrusive

The fourth quality of this research method is unobtrusiveness. As researchers, we participate in natural ways within each community, getting acquainted with people without calling unnecessary attention to ourselves. Following common guidelines for participant observation, we relate with many persons and groups, rather than identify with select groups. We usually avoid designated roles and responsibilities in the communities as well. The temptation to develop personal relationships or influence congregational life does arise, especially for a team of researchers who are teachers and ministers. We seek, however, to 'fit comfortably into the setting' and establish rapport without interfering with our primary function as observers (Bogdan, 1972; Bogdan & Bicklen, 1982; Taylor & Bogdan, 1984). In the rare cases when a researcher has had roles in a community (such as interim pastor), we reflect on these roles in our analysis. The primary research purpose is to observe and

learn from, not to shape, these congregations. Although we know our presence will have some shaping influence, the intention is to keep our influence to a minimum during times of data collection.

Self-Conscious

No research method is devoid of researcher bias, for people have expectations about what they will discover, as well as preconceived ideas and categories. Further, their participation inevitably affects the situation and their observations of it. Thus, our method provides two ways to heighten self-consciousness. First, we follow the standard participant observation technique of recording observers' comments in field notes, bracketed and designated with [OC: ...]. This allows us to acknowledge reactions, responses and hypotheses for the sake of honesty and also for later exploration and testing. After all, the researcher is part of the situation and needs to observe herself or himself as well as others. Sometimes one's own reactions lead to insight into the situation. Second, we work in a research team, which includes a time to identify preconceived beliefs, as described above. We continue this process periodically during and after data collection in each community. We ask one another what beliefs we have about religion, education, and the ethnic group(s) we are studying, as well as what hypotheses are emerging. We record these conversations in field notes, both to heighten self-consciousness and to be a part of the data that we later analyse.

In sum, the basic research method is characterised by narrativity, intersubjectivity, flexibility and openness, unobtrusiveness, and self-consciousness. These guide the specific methodological steps to which we now turn.

Gathering Many Stories Into One

The method is divided into six phases—preparation, story collecting, analysis, storytelling, interpretation and theory building, and proposals for practice. The purpose of the preparation phase is to form a research plan with a selected community(ies) and to prepare the research team with background on the ethnic group and research method. The purpose of the story collecting phase is to listen, watch and record. In the analytic phase, we seek and interpret patterns in the collected stories, and, in the storytelling phase, we gather the many stories and analytic discoveries into one collective story. The fifth phase—interpretation and theory building—is designed to contribute to theological, social scientific, and educational theory. The concluding phase—proposals for practice—is a movement back into practice at the conclusion of analysis and interpretation.

Preparation

The first part of preparation is the practical process of arranging the research with a community. This involves: (1) contacting the community through a pastor or major leader; (2) presenting the project and requesting permission from the community

or administrative body, using consent forms for individuals and for the community as a whole; (3) collecting written documents (such as congregational histories, newsletters, service bulletins, and annual reports); and (4) collecting information about upcoming events and people to interview, as well as suggestions for what to include in the study. In these early contacts, researchers record field notes, which become part of the data. The second part of preparation is for the research team. This includes gathering socio-historical background of the cultural group(s) being studied (through selecting readings related to the subject of research); training in the research method; and reflection on pre-conceived ideas and hypotheses (discussed above).

Story Collecting

Preparation leads into story collecting—listening, watching, recording. Several methods are employed here, the order being adjusted for the congregation's convenience. The research team does seek to complete several observations in the community before beginning the interviews, thus becoming familiar with and to the community.

One method is to do field observations in community life, especially in worship, study and fellowship gatherings, business meetings, and settings suggested by community members. Field notes include attention to the building and grounds, symbols, use of space, and special places. Observations are also made of the patterns of relationship during these gatherings, during informal times, and in diverse locations and contexts.

In observing community rituals, researchers have several questions in mind: what are the ritual events, when and where do they take place, who is involved with what roles, what emotions are displayed, what symbols are used, and how do participants interpret them. These questions are consistent with concerns of Turner (1974), especially in regard to the dual importance of observing and translating rituals. Turner tried, for example, 'to discover 'the Ndembu inside view', how the Ndembu themselves felt and thought about their rituals' (p. 11, cf. 15). Exegeting rituals with community members can uncover subtle meanings that observers easily miss. Our research team seeks to get inside views of communal rituals and practices, even familiar ones.

In addition to observations, we conduct several interviews. One interview is with an administrative body, focusing on the community's mission, strengths, central values, needs, and hopes for the future. We also interview an education committee, inquiring about educational purposes, areas of satisfaction and dissatisfaction, understandings of faith, and approaches to faith formation. Finally, we interview a group of staff and lay leaders, preferably after participating in a staff meeting as a quiet observer. The questions for this group include: demographic data (gender, age, social class, occupations and education levels); significant events in the congregation's history and in the larger community (collected on a timeline); significant places, symbols, and stories of the congregation; descriptions of the congregation's

beliefs, values, and practices; and the leaders' roles. Other sources of demographic and historical data are also used (such as annual reports), but a leadership team is usually a reliable source for general data for faith communities smaller than 400 members (Carroll, Dudley, and McKinney, 1986).

Adding to the group interviews, we conduct individual interviews with representative children, youth, and adults of varying ages, genders, and life situations. In these interviews, we ask questions regarding the individual's faith journey, including significant people and life events. We also inquire how the person experiences the community and describes the community's beliefs, values, and practices.

Finally, data collection includes the community's written documents—histories and at least six months of newsletters and bulletins. These materials are used particularly to discern the beliefs, values, practices, and issues of the community over time.

In all observations and interviews, researchers record field notes soon after the event. The team does not read and discuss the collected notes, however, until data collection is well underway. This gives time for concentrated listening before the active work of analysis begins. In addition to regular field notes, researchers keep a record of words and phrases that are used frequently or in novel ways (Bogdan, 1972). The glossary is used later as data regarding the community's language.

Analysis

We turn next to analysis, where our purpose is to discern and interpret patterns in the collected stories. As described earlier, we make notes on insights as they emerge, but we do not study these until we have done several observations. Then we proceed through primary, secondary, and concluding stages of analysis.

Primary: Analysis begins formally when the research team studies a collection of field notes to identify elements and patterns, proceeding until *all* data are taken into account. This analysis asks five questions of the data: (1) frequent words and phrases; (2) symbols; (3) frequent actions and activities; (4) patterns of interaction; and (5) themes. The first three are first-order analyses, and the last two build upon them. Thus, the team asks the questions in order, but moves back and forth as they make new discoveries.

After each analytic session, someone on the research team collates the results. The team then reviews field notes in order to discuss and alter the analyses in subsequent meetings, considering new data as it is collected. Out of this process, a list of community patterns and themes emerges, which includes points of commonality, difference and disputation within the community. These reflect all of the data gathered, which, in turn, reflect a particular time period in the life of a complex, ever-changing community.

Secondary: Where relevant to research purposes, the research team also asks supplementary questions of the data. We may ask, for example, what educational approaches and assumptions people identify explicitly or embody implicitly, or

what approaches to youth ministry they practice. We sometimes add questions corresponding to the four dimensions of Carroll, Dudley, and McKinney (1986)—program, process, social context, and identity. The Carroll team found that analysis along traditional disciplinary lines was less fruitful than analysis focused on these dimensions (see pp. 9–14). Typical of these questions are the following, varied according to the purposes of a study:

1. What are the structures and activities by which faith is supported, nurtured, and formed or transformed?
2. How do the community's interactions contribute to the formation and transformation of faith, and to educational and religious practice?
3. How does the social context contribute to the same?
4. What is the identity of this community, and how does that identity help shape individual persons and the community's beliefs, values and actions?

In the study of schools and communities of mixed religious traditions, such questions are worded more generally, such as: What are the structures and activities by which people learn about religion and values? The use and choice of supplementary questions is determined by the purpose and context of a particular study.

Concluding: The final step of analysis is grouping themes and patterns discovered in the earlier steps. This stage prepares researchers to gather data into a communal story and, later, to engage in more thorough interpretation and theory-building.

Storytelling

The integrative phase of research is storytelling. The purpose is to re-present the life of each community in a way that authentically reveals its life, bringing together the collected accounts. The assumption is that no story ever exhausts the religious experience or linguistic accounts of that experience; however, storytelling is an appropriate way to express the life of a community as a complex whole. Since religious experience is always larger than what is conscious, and since people never even have access to the whole of consciousness, our hope is not to tell *the* community's story, but to tell *an* authentic story of that community.

Analysis done in the previous phase is the source of this story, yet the story form preserves the narrative quality of community life—a complex of relationships within a particular place and period of time. The Ethogenic method thus draws narrative from critical inquiry, seeking to re-integrate the parts with each other and with place and time. This resembles the approach of Carroll, Dudley, and McKinney (1986), who describe narrative as a way to convey the human drama, and critical inquiry as a way to decrease self-deception (see p. 46; cf. Josselson & Lieblich, 1995; 1996).

The storytelling phase takes account of as much data as possible, offering the kind of 'thick description' described by Clifford Geertz (1973, p. 12; cf. 1983). This

means taking account of different perspectives on faith, formation, transformation, and community. No attempt is made to reconcile all accounts, or to reconcile the several congregational stories into a homogenous whole. In fact, pluralistic versions of faith and community life are expected. We assume a world in which pluralistic perspectives always exist and in which one perspective is not necessarily truer than another. The philosopher Nelson Goodman (1972) echoes the earlier discussion on this point: 'There are very many different equally true descriptions of the world...None of them tells us *the* way the world is, but each of them tells us a way the world is' (pp. 30–31). Storytelling in this research is an attempt to describe a community's multiplicity *and* commonality. This is why representatives help read and revise their community story. We want these to be *their* stories and to represent the fullness of their communal life.

In writing these stories, researchers are aware of the possible salutary benefits for the participating communities. Stories can be important to a community's self-understanding and future action, as recognised by others who study religion in community life. Elaine Lawless (2001) recognises the empowering potential of narrative. Carroll, Dudley, and McKinney (1986) emphasise how a congregation's story encourages identity formation. And Cornel West, a neo-pragmatic philosopher, describes the role of narrative in metaphysical reflection and its pragmatic results: 'Acceptable forms of metaphysical reflections are those of synoptic narratives and overarching vocabularies that provide enhancing self-images and enabling coping techniques for living' (West, 1986, p. 56). The hope of this project is that participating communities and readers will experience such benefits.

Interpretation and Theory Building

The fifth phase of research is to interpret and construct theory, drawing theoretical constructs from the communities' lives. This work offers insights and questions for revising and constructing larger theories, and it poses hypotheses for further research. For example, one of our theoretical insights has been that historical patterns continue to influence the beliefs and values of a religious community over time, both consciously and unconsciously. This insight is supported by the communities we studied, and can be compared with research on cultural carry-overs, as found in studies of the African diaspora. Such comparisons lead naturally into further research and reflection.

The process of interpretation and theorising includes many elements, selected according to the purposes of a particular study. These often include: comparative study with literature in the field; critical dialogue with existing theories of education, ethics, and theology; and evaluative interpretation of the communities (e.g., their life-giving, dangerous, and context-related qualities). In all of these forms, theory-building is marked by mutually critical dialogue with the social sciences, education, and theology, by probing the empirical insights and normative questions raised in the community stories, and by opening doors for further study.

Proposals for Practice

The final phase of Ethogenic research is to draw out proposals for practice. In a real sense, this entire research method is a circle of practice, beginning with the study of practice in communities and cultures, and ending with proposals for practice. This last phase is when educational, ethical, and religious prescriptions are appropriate. These prescriptions may be drawn from theoretical insights of the previous phase, or directly from the community stories. Drawing from the theoretical insight named above, a practical proposal is for communities to explore their historical patterns, both to discern actions that fit their communal heritage and to critique their community's natural patterns. Drawing from the community stories, a practical proposal is to search the communal narratives for models, inspiration, or warnings. In studies of religious education, this includes proposals for teaching, for structuring learning communities, and for engaging religious and cultural diversity, whether within one tradition or across diverse traditions.

Conclusion

Presenting the Ethogenic method in this chapter has value for readers who wish to replicate or evaluate the research. It is also valuable for religious or educational communities who wish to study themselves. Ethogenic method is one that allows researchers, educators, and religious leaders to see into the dynamics of community life. The storytelling, theorising, and practical propositions can then contribute to constructive reflection with living communities. The discourse itself will be a source of wisdom, from which significant ideas and actions can be generated for the wellbeing of the larger human community. The idealistic hope is that the stories, ideas and actions that emerge will guide religious and educational leaders toward fuller understanding of diverse communities and cultures and toward life-giving action.

RELIGION EDUCATION IN SOUTH AFRICA

David Chidester

University of Cape Town, South Africa

Introduction

In South Africa teaching and learning about religion in public schools is a rapidly changing and exciting educational field. South Africa is fortunate to have a Constitution, a Department of Education, and from 1999 through to 2004, a Minister of Education, Professor Kader Asmal, who was clearly committed to advancing human rights. Accordingly, as a matter of principle, any policy with respect to religion in school education must be consistent with constitutional values and the social imperatives of building a culture of human rights in post-apartheid South Africa. Education about religion, in this context, is being pursued in a human rights framework.

With respect to religion, government policy in general has adopted a 'co-operative model' for relations between the many religions and the state instead of arrangements based on theocratic establishment, anti-religious antagonism, or strict separation (see Sachs, 1992). By marking major public occasions with prayers from different religious traditions, the government has acknowledged the potential for the many religions of the country to co-operate in building one, unified, South African nation. In public education, however, the Department of Education has made a principled distinction between the many religious interests, which are best served by the home, family, and religious community, and the national public interest in education about religion, religions, and religious diversity in South Africa. This division of labour is reflected in the Revised National Curriculum Statements published by the Department of Education during 2002:

Religion Education...rests on a division of responsibilities between the state on the one hand and religious bodies and parents on the other. Religion Education, therefore, has a civic rather than a religious function, and promotes civic rights and responsibilities. In the context of the South African Constitution, Religion Education contributes to the wider framework of education

by developing in every learner the knowledge, values, attitudes and skills necessary for diverse religions to co-exist in a multi-religious society. Individuals will realise that they are part of the broader community, and will learn to see their own identities in harmony with others (Department of Education, 2002a; 2002b).

The term 'religion education' can be located in a distinctively South African history of resistance, exile, and return. Basil Moore, who was instrumental in the publication of the first collection of essays in black theology (Moore, 1973), went into exile, studied in Britain, and eventually became Professor of Curriculum Development at the University of South Australia, where he developed guidelines for 'religion education' (Moore, 1991; Moore & Habel, 1982). Returning for an extended visit to South Africa in the early 1990s, Basil Moore renewed his religious contacts with black theologians but he also introduced his work on 'religion education' to many South African educators. The new policy of the Department of Education recalls Basil Moore's principled distinction between the religious interests of 'religious education' and the educational objectives of 'religion education.' Adopting a policy of religion education, rather than continuing earlier policies of religious instruction, the Department of Education has emphasised educational outcomes, as well as social benefits, in teaching and learning about religion, religions, and religious diversity.

Although the department developed this principled position on educational grounds, the Minister of Education had also consulted widely with religious leaders during the period between 1999 and 2002. In September 2002, Minister Asmal formed a reference group of stakeholders from different religious backgrounds, the Standing Advisory Committee for Religion in Education, for ongoing consultations about the role of religion in schools. Clearly, the policy intends no hostility to religion. At the same time, the department recognises the importance of including beliefs, values, and convictions not necessarily derived from religion. For this reason, the curriculum statements have specified that religion education will include 'belief systems and worldviews.' Neither attacking nor promoting religion, religion education has been formulated as a significant part of the school subject, Life Orientation. As an examinable subject in its own right, Religion Studies has been introduced for grades 10–12, which in South Africa would mean age groups ranging between 16–18 years old. All of this was achieved, however, by overcoming the legacy of apartheid education and by negotiating a way forward in the midst of religious controversy.

Policy

Against the background of a historical legacy that privileged a certain kind of Christian religious instruction in schools, the new policy of religion education has not always been understood. In June 2001, for example, Deputy Minister of Education Mosibudi Mangena delivered a speech on the future of religion in South African public schools to the annual conference of the Students' Christian Union.

Affirming both the national unity and religious diversity of South Africa, the Deputy Minister outlined the new policy for religion in education. Simply, the policy was based not on religious interests but on constitutional values and educational objectives. Within the constitutional framework of a democratic South Africa, the role of religion in the public schools must be consistent with core constitutional values of a common citizenship, human rights, equality, equity, freedom from discrimination and freedom of religion, conscience, thought, belief, and opinion. On educational grounds, public schools have a responsibility to teach about religion and religions in ways that are different from the religious education, instruction, or nurture provided by the home, family, and religious community. In contrast to the promotion of particular religious interests in the 'religious education' of the past, this new policy of 'religion education' advances educational goals of teaching and learning about religion, religions, and religious diversity (Mangena, 2001).

Nothing can be said so clearly that it cannot still be misunderstood. In an article covering the speech for *The Teacher*, the headline shouted provocatively, 'Keep God out of the public schools, says Mangena' (Naidu, 2001). Of course, Deputy Minister Mangena said nothing of the sort—rather than making theological or atheological claims, he outlined an educational policy that was consistent with South Africa's Constitution.

Instead of advancing a religious (or antireligious) position, this educational policy is underwritten by crucial constitutional provisions that guarantee both the freedom for religious expression and the freedom from religious coercion. Recognising the vitality and diversity of religion in South Africa, which is clearly protected along with conscience, thought, belief, and opinion (15[1]), the Constitution also guarantees freedom from religious discrimination or discrimination on the basis of religion (9[3]) (South African Government, 1996). Inevitably, the promotion of a particular religion, a set of religions, or a certain religious perspective involves the public schools in religious discrimination by advancing privileged religious interests and discrimination on the basis of religion by disadvantaging learners from 'underprivileged' religious backgrounds. In keeping with the provisions of the Constitution, educational policy must be dedicated not to the teaching, promotion, or propagation of religion but to teaching and learning about religion, religions, and religious diversity in South Africa and the world.

Although the distinction between the teaching of religion and teaching about religion often seems to be misunderstood in media coverage, public debates, and religious opposition to the new educational policy, international standards have increasingly been based upon the recognition of the difference between the promotion of religion and education about religion. Under the auspices of the United Nations High Commissioner for Human Rights, the consultative conference on religion in school education that was convened in Madrid during November 2001 took this distinction for granted. The report prepared for that conference assumed the basic difference between teaching about religion in schools and the teaching of religion in the catechisms or theologies of religious communities. By definition, according to this report,

Religious Education should be conceived as a tool to transmit knowledge and values pertaining to all religious trends, in an inclusive way, so that individuals realise their being part of the same community and learn to create their own identity in harmony with identities different from their own. As such, religious education radically differs from catechism or theology, defined as the formal study of the nature of God and of the foundations of religious belief, and contributes to the wider framework of education as defined in international standards (Amor, 2001; see Hera & Maria Martínez de Codes, 2002).

Consistent with this definition, South Africa's new educational policy for teaching and learning about religion is inclusive, enabling learners to explore their own identities within the diversity of South Africa. Departing from the compulsory Christian religious indoctrination of the apartheid era, the new policy proposes educational outcomes in teaching and learning about religious diversity that promote empathetic understanding and critical reflection on religious identity and difference. According to this new policy, religion education, supported by clear educational outcomes, curriculum statements, and assessment criteria, can serve important educational outcomes while also working to increase understanding, reduce prejudice, and expand respect for human diversity.

History

Religion Education represents a dramatic departure from the religious education, instruction, or indoctrination of the past. Under the apartheid regime, with its commitment to Christian National Education, a narrow set of religious interests captured religious education. Although all education was supposed to inculcate a Christian national ethos, religious education, assuming a Christian, Bible-based character, sought to produce distinctively religious outcomes. Religious education was driven by a particular kind of Christian confessionalism and triumphalism, a confessionalism that required pupils to embrace prescribed religious convictions and a triumphalism that explicitly denigrated adherents of other religions.

In the old regime, religious education was directed towards compelling learners to make a confession of faith. According to a manual for Biblical Instruction published as recently as 1990, learners were expected to embrace a particular version of Christian faith. Not merely acquiring knowledge, 'Children must personally accept, and trust for their personal salvation, the triune God introduced to them in the Bible' (Department of Didactics, 1990, p. 30). Similarly, a syllabus for Religious Education asserted that the aim for the 'devout teacher' was to ensure that learners, 'through belief in the Holy Trinity,' were able 'to affirm the Apostles' Creed with sincerity and conviction' (cited Chidester, Mitchell, Phiri, & Omar, 1994, p. 15).

Along with these confessional interests, Religious Education and Biblical Studies under apartheid promoted a Christian triumphalism. As the manual in Biblical

Instruction insisted, 'a public school must show tolerance and respect for differing doctrinal convictions, as long as there is no denial of Jesus Christ as the Messiah' (Department of Didactics, 1990, p. 19). In a widely used textbook for Religious Education and Biblical Studies, this Christian triumphalism resulted in claims to a privileged religious ownership of the nation and its public schools by proclaiming that South Africa 'is a Christian country and it is only right that our children be taught in the Christian faith—also in our schools' (Kitshoff & Van Wyk, 1995, p. 182). Abandoning any pretence of tolerance or respect for difference, the textbook asserted bluntly that a 'child who follows the Christian faith is more likely to behave in a moral way than a non-Christian or an un-religious child' (Kitshoff & Van Wyk, 1995, p. 170).

In a constitutional, democratic, and religiously diverse South Africa, this kind of religious education, with its indoctrination of Christian children and denigration of adherents of other religions, certainly cannot be sustained. But what are the other possibilities? Preparing for the democratic transition as early as 1992, the National Education Policy Investigation (NEPI) considered the options. In its report on the curriculum, the NEPI insisted that a democratic South Africa had to abandon the previous system of religious education in which particular religious principles were explicitly taught in Christian religious instruction and implicitly taught throughout the entire curriculum in the name of Christian National Education. As the NEPI found, such an agenda for religious education, instruction, or indoctrination established religious discrimination and religious coercion in education.

Recognising the need for change, the NEPI considered three options: First, the state could eliminate religion entirely from the school curriculum, but neglecting such an important feature of South African life would not do justice to the importance of religious diversity in our history and society. Second, we might establish parallel programmes in religious instruction, developed by different religious groups, but such a parallel model, entrenching a kind of 'religious apartheid,' would still embody religious discrimination and religious coercion, since all students would be required to study a single-tradition religious education programme devoted to particular religious interests. Third, we might introduce a programme of multi-religion education that would teach students about religion rather than engaging in the teaching, confession, propagation, or promotion of religion. Guided by clear educational objectives, teaching and learning about religion and religions in public education promises social benefits of increased tolerance and understanding of diversity (National Education Coordinating Committee, 1992).

Since the publication of these findings of the National Education Policy Investigation, debates about religion and public education have generally revolved around the question of whether or not a compromise could be worked out that accommodated both options two and three, mixing separate programmes of religious instruction, which serve religious interests in the promotion of a state-sanctioned, implicitly supported set of religions, with teaching and learning about religion, religions, and religious diversity. After a decade of research, consultations, and

ministerial commissions, the Department of Education finally found that such a mixture of the teaching of religion and teaching about religion was an educational contradiction rather than a viable compromise. As part of the *Manifesto on Values, Education, and Democracy*, the Department of Education (2001) announced its policy of Religion Education. In the revised curriculum, open for public scrutiny and debate, it published the primary educational objective of religion education, within a constitutional and human-rights framework: 'The learner should be able to demonstrate an active commitment to constitutional rights and social responsibilities and shows sensitivity to diverse cultures and belief systems' (Department of Education, 2002a; 2002b). Public controversy ensued, raising important issues, not only about educational policy, but also about the spirit of the nation.

Controversy

In response to the new curriculum, some Christians in South Africa, especially those with ideological, organisational, and financial links with conservative Christian groups in the United States, vigorously objected to the policy for religion education. Through an organised, coordinated campaign, they argued that the new policy violated both their human rights and their constitutional rights to freedom of religion. This campaign drew together apparently separate organisations—a Christian organisation for home schooling (Pestalozzi Trust), a Christian organisation for evangelising Africa (Frontline Fellowship), a Christian political party (the African Christian Democratic Party), and other Christian groupings—in common cause against the new policy, curriculum, and learning outcomes. Looking back on this controversy, it might be useful to reflect briefly on how opposition has come from a range of different Christian points of departure. At the risk of simplifying, we can identify four different Christian positions—Reconstructionist, Protectionist, Ecumenical, and Interfaith—that have expressed very different religious interests in opposing the new policy.

First, as the most vocal opponents, Christian Reconstructionists have mobilised letter-writing campaigns, media events, and public meetings against the new policy. Culminating in a public meeting in the Western Cape at the Christian Centre on 9 October 2001, these opponents advanced the argument that teaching and learning about religion, religions, and religious diversity, which is an educational rather than a religious activity, was actually promoting a religious worldview. Summarising the meeting of 'concerned Christians' at the Christian Centre, the reporter noted that the principal problem with the new policy was its 'active promotion of a single set of values under the guise of tolerance' (Christian Centre, 2001). These values, which were glossed as relativism, situational ethics, and the equality of all religions, were castigated as the basic elements of a New Age religion. The reporter declared:

This set of implicit values is present in most New Age systems of thought. Teaching and assessment based on these values effectively constitutes state

promotion of a religious worldview in itself (secular humanism). This is in total contradiction with the constitutional provision of freedom of religion (Christian Centre, 2001).

Although the promotion of relativism, situational ethics, and the religious equivalence of religions nowhere appears in the policy, 'concerned Christians' at this meeting could nevertheless discern the implicit traces of a religious worldview, the religion of 'secular humanism,' which was allegedly being established in public schools as an act of religious discrimination against Christians (Christian Centre, 2001).

Although this campaign certainly drew in parents who were concerned about the direction of educational policy in South Africa, the argument that education about religion 'implicitly' promoted a religious worldview—the religion of secular humanism—was derived from right-wing Christian organisations in the United States of America. Insisting that 'secular humanism' has been defined as a religion by the United States of America Supreme Court, Christian opponents of the new educational policy in South Africa have been misled by right-wing Christian campaigns in America that have actually failed to sustain that case, especially in their attempts to exclude science textbooks that do not explicitly promote the biblical account of creation on the grounds that they thereby implicitly promote the 'religion of secular humanism.'

In the case of the Pestalozzi Trust, this organisation for home schooling was explicitly linked, not only to a conservative Christian parent organisation in the United States of America, but also to the work of R. J. Rushdoony, the American founder of Christian Reconstructionism. Advocating a literal interpretation of the Bible and a literal adherence to biblical law, Rushdoony inspired the Chalcedon Foundation, the Institute for Christian Economics, the Rutherford Institute, and other right-wing Christian organisations in the United States. Rushdoony was a champion of religious apartheid. 'Segregation or separation,' he wrote, 'is a basic principle of Biblical law with respect to religion and morality' (Rushdoony, 1973, p. 294). In defence of religious apartheid, Rushdoony opposed any form of civil toleration of religious difference, because 'the believer is asked to associate on a common level of total acceptance with the atheist, the pervert, the criminal, and the adherents of other religions as though no differences existed' (Rushdoony, 1973, p. 294). Under the influence of such religious prejudice, Christian Reconstructionists urge South African parents to prevent their children from being exposed to 'foreign' religions, forgetting that those religious and other belief systems are not foreign but flourishing in South Africa.

Disregard for adherents of other religions informs not only theory but also political practice among Christian Reconstructionists. According to a prominent disciple of Rushdoony, Gary North, Christian Reconstructionists are justified in manipulating democratic, constitutional means for Christian ends. 'We must use the doctrine of religious liberty to gain independence for Christian schools,' North wrote, 'until we train up a generation of people who know there is no religious neutrality, no neutral law, no neutral education, and no neutral civil government'

(North, 1982, p. 25). Once that programme in Christian religious education was far enough advanced, North declared, then the students it produced would 'get busy constructing a Bible-based social, political, and religious order which finally denies the religious liberty of the enemies of God' (North, 1982, p. 25).

Certainly, Christian Reconstructionism, with its manipulative rhetoric, religious apartheid, and anti-democratic tactics, cannot provide any basis for educational policy in a diverse and democratic South Africa. Nevertheless, during the second half of 2001, most of the media attention given to the new curriculum was framed by the religious agenda of Christian Reconstructionists.

Second, Christian Protectionists, who have also gained some media attention, have been trying to retain the religious benefits of the old system of religious education. Wanting to preserve the status accorded to a particular kind of Christian religious and biblical instruction under the apartheid regime, these opponents of the new policy have an agenda that is different than the American-influenced 'concerned Christians.' Nevertheless, on many points, these defenders of the old order have made common cause with arguments advanced by the Christian Reconstructionists. In a widely distributed statement by Professor Pieter de Villiers, Chair of the South African Society of Biblical and Religious Studies, the new educational policy is attacked, not as a New Age religion, but as a 'new ideology in school religion' (De Villiers, 2001). The organisation that Professor De Villiers represents, which until recently was the 'Society for Biblical Studies in South Africa,' engaged in a cynical manipulation of terminology by adding to its title, the phrase, 'Religious Studies,' to suggest that its members had expertise in the open, plural, intercultural, and interdisciplinary study of religion and religions. Based on Professor De Villiers's statement in opposition to the new policy, it is difficult to conclude that he actually represents teaching and research in Religious Studies in South Africa.

Ignoring the logical, methodological, and constitutional problems entailed by combining separate programs in the promotion of religion with education about religion, De Villiers longs for an arrangement, considered by an earlier ministerial commission, which he thinks 'sanely allowed other options next to a multi-religious approach in schools' (De Villiers, 2001; see Department of Education, 1999, p. 5; Stonier, 1998). Those 'other options,' referring to separate programmes in Christian, Jewish, Muslim, Hindu, and perhaps 'other' religious instruction, although how far the 'other' extends is unclear, stand in contradiction to teaching and learning about religion, in all its diversity, as a viable educational programme in South African public schools. Living with such a basic contradiction cannot be a formula for sanity. According to De Villiers, however, local schools should be allowed to work out those 'other options,' in the light of their particular, distinctive, religious ethos. In whatever way those local religious interests might be adjudicated, however, the advancement of religious interests would still come into conflict with constitutional protections against discriminating for or against religions.

In defending single-faith religious instruction, De Villiers made the remarkable assertion that Christian religious education can provide the basis for 'understanding among faiths' in a 'healthy society,' because in the wake of the destruction of the

World Trade Centre, 'Christian churches without multi-religious leanings in the United States organised the protection of Muslim communities' (De Villiers, 2001). Although De Villiers seemed to be advocating a Christian religious education that would fulfil the curricular outcome of showing sensitivity to diverse cultures and belief systems, even 'without multi-religious leanings,' this prospect is as remote in the United States as it is in South Africa. It is difficult to argue that Muslim communities would feel safe in a Christian America. Despite his quasi-scientific, medicalised, or psychologised rhetoric of 'sane' and 'healthy,' the Chair of the South African Society of Biblical and Religious Studies actually wants to protect Christian religious interests in education, even by advancing the unsupportable proposal that Christian education is a good basis for dealing with religious diversity in South Africa.

By contrast, a third position, Christian Ecumenical, has been drawn into this controversy, perhaps reluctantly, since most of its adherents are not interested in defending the particular kind of Christian privilege inherited from the apartheid regime. As a broad-based, ecumenical Christian association, the South African Council of Churches (SACC) has certainly earned credibility in wrestling with a wide range of social problems in apartheid and post-apartheid South Africa. In his diatribe against religion education, Pieter de Villiers invoked the support of the SACC. According to De Villiers (2001), at its triennial national conference in August 2001, the SACC passed a motion 'requesting the minister not to impose the multi-religious approach on schools as an exclusive system'. Dramatically misrepresenting the deliberations within the SACC, this statement also distorts the actual resolution of the conference. As that resolution was formulated, the SACC affirmed the basic educational aims, objectives, and outcomes of the new policy of religion education. Regarding the question of religion and public education as a complex and sensitive issue, the SACC held 'that it is important for learners to be informed about the various religious beliefs of the people of South Africa' (South African Council of Churches [SACC], 2001).

At the same time, the SACC accepted submissions from constituents interested in maintaining single-faith programmes in Christian education in the schools. Accordingly, the SACC resolved that its General Secretary should engage in conversations with the Minister of Education 'with the intention of promoting a religious education policy that makes provision for both a multi-religious approach and for single-faith learning programs' (SACC, 2001). Unlike the Christian Reconstructionists or Christian Protectionists, therefore, the ecumenical Christians of the SACC recognised and affirmed the important educational value of learning about the religious beliefs of all the people of South Africa.

Finally among Christian objections, a Christian Interfaith position can be identified that objects not to learning about religions but to the apparent absence of explicit attention to spirituality in the new policy. Assuming that learning about religions will not engage the affective, emotional, or spiritual development of learners, as if learning about religion was only cognitive, this position asserts that the policy is flawed because it does not explicitly identify outcomes of 'spiritual

development.’ According to Paul Faller, a prominent Catholic educator, director of the Catholic Institute of Education, innovator in the field of inter-religious education, and chair of the ministerial committee for religious education during its deliberations in 1998, the new policy does not adequately address spiritual interests because it ‘will not invite the learner to the challenge of spiritual and moral development, or to the appreciation of and free commitment to a specific faith commitment’ (Faller, 2001). Faller calls for ‘a formative rather than a purely descriptive Religious Education’.

Although the new educational policy definitely does not promote religious, spiritual, or faith commitments, it also does not foreclose any opportunities for learners to make any of these personal discoveries in, and through, the process of learning about religious and other convictions. In the process of learning about religion, pupils can certainly also learn from, with, and through religion in ways that form their own commitments. Religion Education, as a formative enterprise, develops not only critical skills in description and analysis but also creative capacities for imagination, empathy, exploration, and discovery. The assessment standard specified for Religion Education in the final year, Grade 12 (17–18 years old), certainly points to this formative capacity by expecting the learner to formulate ‘a personal mission statement based on core aspects of personal philosophies, values, beliefs and ideologies, which will inform and direct actions in life’ (Department of Education, 2002b). Unlike the religious formation enforced by the Religious Education of the past, however, this educational goal is not determined by any prescribed religious content. It is perhaps because of the mistakes of the past that even religious educators who are open to religious diversity have tried to mobilise religious opposition to the new policy.

Different religious interests, therefore, have surfaced in the controversy over the new policy for religion education. Although ‘concerned Christians’ have spoken against the policy, religious leaders from a variety of religious communities have supported this new initiative. In public education, as Father Albert Nolan has argued, ‘the school is not responsible for nurturing the religious development of the scholars but for providing learners with the knowledge about religion and morality and values and the diversity of religions’ (Nolan, 2001). Representing the Muslim Judicial Council, Sheikh Achmat Sedick has observed that there is no problem with religion education ‘as long as it is orientation and not indoctrination’ (Lombard, 2001, p. 5). In meetings with the Minister of Education, other religious leaders have indicated their support for teaching and learning about religion. Religious opposition or support, however, cannot determine national policy for religion in public education. Instead, as the new policy insists, the role of religion in schools must be consistent with constitutional provisions for freedom of religious and other beliefs, and freedom from religious and other discrimination.

Within this constitutional framework, trained educators rather than religious leaders, clergy, or the old regime’s ‘devout teachers’ must take the lead in developing resources for teaching and learning about religion, religions, and religious diversity. Although innovative textbooks have been developed, much more needs to

be done to provide teachers with effective materials and methods for realising the educational objectives of religion education. Recent textbooks for religion education enable learners to explore religious diversity (Amin, Jankelson-Groll, Mndende, Omar & Sadie, 1998), religious festivals (Stonier, Mndende, Omar, Pillay, & Reisenberger, 1996), sacred places (Stonier & Derrick, 1997), and African indigenous religious heritage (Kwenda, Mndende & Stonier, 1997). Although much more needs to be done, these and other resources that are currently being produced represent a good beginning for religion education in South Africa.

Curriculum

Between educational policy and educational practice in the classroom, of course, a huge gap looms. In his opposition to the new policy, the Catholic educator Paul Faller has actually celebrated this gap, observing that teachers will be 'defining and redefining the curriculum every day, in every classroom,' so by encouraging teachers to advance a religious education that is 'formative and not simply informative,' he hopes to be able to establish in practice what he could not achieve in policy (Faller, 2002).

Certainly, religious educators who have religious interests will find other ways to subvert the new policy. In the light of the recommendations of the final document from the International Consultative Conference on School Education in Relation with Freedom of Religion and Belief, Tolerance, and Non-Discrimination held in Madrid during November 2001, (Hera & Maria Martínez de Codes, 2002) educators in South Africa are faced with the challenge not only of formulating policy and curricula but also of providing teachers with materials, methods, and training for teaching about religion, religions, and religious diversity in South Africa and the larger world.

During 2002, progress was made on clarifying the general curriculum for Religion Education as part of the subject area of Life Orientation. As the curriculum for this area was negotiated, learning about religion was located in the context of 'social development,' situated in relation to learning about human rights, democratic participation, diversity, and community. In General Education and Training (GET, Grades R–9), the learning outcome for Social Development, at every level, was specified: 'The learner will be able to demonstrate an understanding of and commitment to constitutional rights and responsibilities, and to show an understanding of diverse cultures and religions' (Department of Education, 2002a). Along with outcomes in Health Promotion, Personal Development, and Physical Development and Movement, this learning outcome for Social Development makes up the learning area of Life Orientation. In Further Education and Training (FET, Grades 10–12), we find a similar location of teaching and learning about religion within Life Orientation, with religion education situated within the learning outcome for Responsible Citizenship in which: 'The learner is able to demonstrate competence and commitment regarding the values and rights that underpin the constitution in order to practice responsible citizenship, and enhance social justice and sustainable

living’ (Department of Education, 2002b). Throughout the curriculum, therefore, teaching and learning about religion is integrated into social development and citizenship education.

Within that context, learning about religion, religions, and religious diversity is registered in terms of assessment standards. At each grade, summarised here from Reception (i.e. the grade before grade 1) through to 12, the learner demonstrates the achievement of the broader educational outcome of social development with respect to the component of religion education when he or she:

- R: Identifies and names symbols linked to own religion.
- 1: Matches symbols associated with a range of religions in South Africa.
- 2: Describes important days from diverse religions.
- 3: Discusses diet, clothing, and decorations in a variety of religions in South Africa.
- 4: Discusses significant places and buildings in a variety of religions in South Africa.
- 5: Discusses festivals and customs from a variety of religions in South Africa.
- 6: Discusses the dignity of the person in a variety of religions in South Africa.
- 7: Explains the role of oral traditions and scriptures in a range of the world’s religions.
- 8: Discusses the contributions of organisations from various religious to social development.
- 9: Reflects on and discusses the contributions of various religions in promoting peace.
- 10: Displays knowledge about the major religions, ethical traditions, and belief systems in South Africa, clarifies own values and beliefs, and respects the rights of others to hold their own.
- 11: Critically analyses moral issues and dilemmas and explains the consequences of beliefs and actions.
- 12: Formulates a personal mission statement based on core aspects of personal philosophies, values, beliefs and ideologies, which will inform and direct actions in life (Department of Education, 2002a, 2002b).

Certainly, these educational expectations, which enable learners to begin engaging with the religious diversity of their country and world, should be part of social development and citizenship education. In order to participate in a unified non-racial, non-sexist, and democratic South Africa, as well as in an increasingly globalising world, learners will need at least this level of educational engagement with religion, religions, and religious diversity.

To give a sense of proportion, however, we need to recognise that the curriculum has actually allowed very little space for this educational activity. In Grades R-9, the learning area of Life Orientation, which includes four outcomes—Health Promotion, Social Development, Personal Development, and Physical Development and Movement—has been allocated eight percent of the teaching time out of the total curriculum. As one of four outcomes in Life Orientation, Social Development can

be expected to account for two percent of teaching time. As one in four assessment standards within Social Development, Religion Education ends up accounting for perhaps 0.5 percent of the overall curriculum content. Although these calculations cannot be applied mechanically, we can only conclude that Religion Education, the focus of so much controversy and contestation, actually has only a very small share of the general curriculum in South African schools.

So, have we been fighting over nothing (or almost nothing) in these battles over the future of religion in South African public schools? Although we have ended up with less than anyone wanted, perhaps we have ended up with exactly what we need. In a country that takes religion very seriously, with strong bonds of religious solidarity, but also with the potential for religious misunderstandings, divisions, and conflict, the relatively small space given for religion in schools might be just right. Situated firmly with a human rights framework, and integrated into educational outcomes for citizenship, social development, and social justice, teaching and learning about religion might actually be in the right proportion to the rest of the curriculum for what South Africa needs at this historical moment. At the very least, the limited time and space allocated for religion in the curriculum help clarify religious objections to the new policy for Religion Education.

On the one hand, religious educators arguing for a religious, religious productive, or 'formative' religious education could certainly not argue in good conscience that a child's religious formation can possibly be managed by public schools within the small amount of classroom time allocated to religion. Instead, as the new educational policy suggests, religious formation must be the responsibility of homes, families, and religious communities. Given the demands on the curriculum, the best we can hope for is that the school can provide learners with a basic introduction to religion, religions, and religious diversity in ways that might increase understanding, reduce prejudice, and facilitate respect. If those educational goals are to be achieved, then religion cannot be dealt with religiously. In the space and time available, religion, like other aspects of human formation, such as race, class, and gender, must be addressed critically and creatively as part of the social fabric of South Africa that every child should study.

On the other hand, religious educators arguing against the viability of educational initiatives in teaching and learning about religion, religions, and religious diversity must come to terms with the modest goals of Religion Education. No child, many of these religious educators have argued, should be exposed to other religions until their own religious identity has been formed. Caving into religious pressure from 'Concerned Christians' with an interest in determining the religious formation of children, the Provincial Minister of Education in the Western Cape, André Gaum, in April 2002 announced that his province would not be implementing the new provisions of the curriculum for Religion Education. Insisting that, 'awareness of other religions is best developed later in the school child's life,' this provincial Minister of Education defied national policy by instructing his department to develop programmes for Grades R through 6 that 'do not include requirements for study of other religions' (Gaum, 2002). In other words, he insisted that learners within his

jurisdiction should be prevented from achieving the minimal expectations of the curriculum during these years that would enable them to identify and name symbols linked to their own religion, describe important days from diverse religions, and discuss diet, clothing, and decorations, significant places and buildings, festivals and customs, and the dignity of the person in a variety of religions in South Africa. Although he thought he was responding to legitimate religious interests, Provincial Minister of Education André Gaum was actually condemning his pupils to ignorance about their world.

These struggles continue. Sufficient progress has been made, however, in policy, curriculum, and materials development to support education about religion that is consistent with South African constitutional values and international initiatives in human rights such as the Madrid Document of 2001 (Hera & Maria Martínez de Codes, 2002). With respect to religion and belief, these principles have been established in South African educational policy and national curriculum. Following the recommendations from Madrid, we are faced with the challenges of training, motivating, and enabling teachers, of documenting 'best practices' in education about religion, and of furthering international exchanges in the field of religion education. Even within the small compass allowed by the curriculum for this enterprise, enormous gains can be anticipated in advancing education in human rights, citizenship, social justice, and diversity by paying attention to religion and religions, not as a religious activity, but as an educational priority in teaching and learning about our world.

RELIGIOUS EDUCATION CULTURE IN MODERN TURKEY

Recep Kaymakcan

Faculty of Theology, University of Sakarya, Turkey

Introduction

Officially Turkey has been a secular country since 1937. It is also a predominantly Muslim country with few members of other faiths. The place of religious education has been frequently discussed in the main because of the fluctuating relationship between state and religion. Until recently, the agenda of discussions pertaining to religious education generally focused on the existence of religious education in state schools; the quality of religious education received meagre attention. Following the acceptance of religious education as an academic discipline at university level, the introduction of compulsory religious education in schools and the recognition of the importance of the science of education, academics and members of the media have begun to discuss the quality of religious education in Turkish schools. The move towards membership of the European Community has accelerated this process.

The traditional understanding of the teaching of religion has had, and continues to have, a great influence on religious education in schools in Turkey. There has been, however, a considerable shift from a traditional to a more pluralistic religious education (with the introduction of the new primary religious education curriculum in 2000). To understand these recent changes more accurately we need to look at the traditional teaching of Islam within Turkish religious education. I shall outline this traditional teaching of religion (Islam), defined here as the ‘ilmihal centred approach’; and then summarise the new developments. It is necessary first of all to set this discussion in the context of the history of the development of religious education in modern Turkey

Historical Background and Legal Provision of Religious Education

Perhaps the most spectacular development in Islamic education in contemporary Islam has occurred in Turkey. As a successor of the Ottoman Empire, the nation-state of Turkey came into existence in 1923. This was more than a political event; it was also a social, cultural, and economic revolution. In this context, secularism emerged as a vital, and key, concept. The boundary between religion and politics in Turkey was drawn in terms of secular principles; the major reforms were closely connected with secularism.

Within religious education itself in modern Turkey many fluctuations can be observed. For a quarter of a century, in the republican era, the Turkish educational system worked on a strictly secular basis: all levels of religious education were officially banned. After the Second World War, improving socio-economic relations with Western democracies and the introduction of a multi-party system influenced the educational structure; religion itself emerged as a political and cultural issue especially during the transition from a one-party to a multi-party system (from 1946–1950). This revival of interest in religion was part of an ideological reaction against the strict secularism of the republic among a diverse group of individuals who felt that the moral basis of the society was being corroded and that there should be open criticism of the restrictions the government imposed on religious teaching. Soon after the introduction of a multi-party system, the political parties were quick to realise the potent force of Islam in their efforts to mobilise mass support. Right wing parties, in particular, began to take a more liberal attitude towards religion. This liberal attitude in dealing with religion and religious practice continued to characterise the behaviour of Turkish governments throughout the following decades (Kushner, 1986). In this context religious education emerged as an important issue. After a long debate at the political level, religious education in state schools was introduced on a voluntary basis not only in primary schools (by 1949), but also in middle schools (by 1956) and in high schools (by 1967). This optional religious education in schools continued up to 1982 (Bilgin, 1990).

After the 1980 military take-over, the issue of the introduction of compulsory religious education was hotly discussed by a range of different people and groups. The eventual decision of the Military Security Council was announced in Erzurum by the President of Turkey as well as the head of the military council in a public speech on 24 July 1981:

By taking this new decision, religious education will be introduced in every primary, middle and high school on a compulsory basis. Consequently our pupils will receive religious education from state schools. In the majority of Western countries religious education is given by schools. In fact, compulsory religious education in schools is compatible with secularist principles. In this matter Atatürk stated: 'Religion must be taken out from the hands of ignorant people, and the control should be given to the appropriate people'. For these reasons, we will introduce compulsory religious education in our schools (Milli Guvenlik Konseyi Genel Sekreterliği, 1981, p. 181).

This compulsory religious education, in both elementary and intermediate schools, was to have several purposes. One was the provision of knowledge: about religion in general, the Islamic religion, and ethics. Another was the desire to develop ethical and virtuous human beings. Religious education was in these ways in harmony with Turkish national educational policy and its general goals and principles as well as with Atatürk's principles of secularism. It was thus to strengthen, from a religious and ethical perspective Kemalism, national unity and solidarity, and humanitarianism (Milli Eğitim Bakanlığı, 1981).

This decision was included in the 1982 Constitution as the 24th article. The new regulation changed the official name of religious education to 'Religious Culture and Ethics Knowledge'. Courses were to be taught from fourth grade primary to the end of middle school for two hours per week; and, in high school, for one hour. This remains the legal position. It should be noted that there is only one ground for exemption from compulsory religious education: a pupil who is an adherent of a non-Islamic religion such as Christianity or Judaism has the right to withdraw from taking the course of religious education. There is no alternative provision, such as a course in ethics, for someone who exercises this right of withdrawal (Kaymakcan, 1997).

Ilmihal-Centred Approach in the Teaching of Islam

The traditional teaching of Islam both inside and outside school religious education in Turkey can be described as the 'ilmihal-centred approach'. This understanding of teaching Islam, developed during Turkish-Islamic cultural history, has had a great impact on religious education in schools. It has itself recently incorporated some pedagogical improvements.

Brief History of Ilmihal in Turkish Tradition

The word 'ilm hal', derived from the Arabic language and literally meaning 'knowledge of circumstances', refers to 'a book written to teach principles of religion' according to the Turkish language dictionary (Turk Dil Kurumu, 1988, p. 232). An ilmihal is a book written in response to the practical needs of ordinary Muslims; it usually aims to provide knowledge in terms of three dimensions of Islam: faith (*iman*), worship (*ibadat*) and ethics (*akhlaq*). Its language is usually simple and straightforward because it is written for a wide range of Muslims (Bayram, 1981). In its content and structure, ilmihal may be seen as the interpretation of the well-known Hadith of Gabriel:

One day while the Prophet was sitting in the company of some people, (The angel) Gabriel came and asked, 'What is faith?' Allah's Apostle replied, 'Faith is to believe in Allah, His angels, (the) meeting with Him, His Apostles, and to believe in Resurrection.' Then he further asked, 'What is Islam?' Allah's Apostle replied, 'To worship Allah alone and none else, to offer prayers perfectly, to pay the compulsory charity (Zakat) and to observe fasts during the month of Ramadan.'

Then he further asked, ‘What is Ihsan (perfection)?’ Allah’s Apostle replied, ‘To worship Allah as if you see Him, and if you cannot achieve this state of devotion then you must consider that He is looking at you.’...Then that man (Gabriel) left and the Prophet asked his companions to call him back, but they could not see him. Then the Prophet said, ‘That was Gabriel who came to teach the people their religion.’ Abu ‘Abdullah said: He (the Prophet) considered all that as a part of faith (Bukhari, vol. 1, book 2, no. 47).

This hadith clearly emphasises the importance of faith, worship and ethics in the teaching of Islam. Bayram argued that these three realms, inherited from this hadith, became the model for the ilmihal tradition in Anatolia (Bayram, 1981). Ilmihal generally gives more emphasis to the second area (worship) because Muslims need to learn more about acts of worship. Historically, the entitled ‘*Menahic-i Seyfi*’ written by the scholar Ahi Evren in Persian in 1184 was the first study in the style of the ilmihal tradition in Anatolia. The first Turkish language ilmihal (Mukaddime) was produced by Iznikli Kutbuddin in 1418 (Bayram). Afterwards, a very large number of works in the ilmihal form were written in Turkey. The seven-century-old ilmihal tradition was created to meet the demands of the mass of the Muslim population for the teaching of Islam.

In the last years of the Ottomans, ilmihal became in addition a name for a school subject; and one that was generally included in the newly-established secular primary school curriculum. For instance, ilmihal as a subject could be seen in the primary school curriculum (ibtida-i mektepleri) in 1892 and 1904, where it was used to refer to teaching Islam (Akyuz, 1989). It was also included in the first year of the Asiret Mektebi which were opened by the reign of Abdulhamid II to educate the sons of tribal leaders at secondary school level (Rogan, 1996). Again, Ziya Gokalp, the founder of modern Turkish nationalism, provided a place for ilmihal in his proposed school curriculum (Berkes, 1959). As a result, it can correctly be said that the ilmihal approach has a deep and strong historical base, both in Turkish religious culture and in school education.

Buyuk Islam Ilmihali (Great Islamic Ilmihal): An Exemplar Ilmihal

In order to illustrate what is meant by ilmihal and the ilmihal-centred approach, I shall select one representative ilmihal among many ilmihals from the republican period in Turkey: the ilmihal ‘*Buyuk Islam Ilmihali*’ (Great Islam Ilmihali) written by the famous republican Muslim scholar Omer N. Bilmen in 1949. Several reasons may be given for selecting it. Firstly, it was the first comprehensive ilmihal produced in that period. Secondly, its framework has provided an example for later ilmihals. Thirdly, nobody can argue that there is a more well-known ilmihal in Turkey. It has sold approximately three million copies, and perhaps, after the Qur’an, is the second widely used religious source in Turkey. Finally, the author of this ilmihal, Bilmen, is one of the most highly appreciated and respected religious scholars both among different Muslim groups and within the state in recent history (Yavuz, 1993).

Above all, he is significant for this context because of his scholarly competence and, more importantly, his attitude to politics, since he paid special attention to remaining steadfastly apolitical.

A review of *Buyuk Islam Ilmihali* (1996) can provide the basis for the discussion of the ilmihal-centred approach. The aim of ilmihal tradition is to provide a basic knowledge about Islam in a descriptive and authoritative manner. It aims to respond to some religious issues in terms of the needs of ordinary believers in our time. Bilmen's ilmihal deals mainly with three aspects of Islam: faith, worship and ethics. In its final chapter, it discusses the history of the prophets. The ten chapters vary considerably in length according to the subject matter.

Chapter one deals with Islamic faith. After a brief reference to a system of classification of religions, the six acts of faith in Islam are explained. These are: belief in one God, angels, sacred Scriptures, prophets, life after death and predestination. The six acts of faith are then elaborated according to traditional understanding. In other words, the reasons provided for every tenet of Islamic faith are drawn, in the main, from the understanding of the Islamic faith community alone.

The next five chapters contain detailed explorations of the acts of worship (*ibadat*) in Islam which are often referred to as the 'five pillars of Islam'. These consist of the declaration of faith, prescribed prayer (*salat*), fasting (*savm*), legal alms (*zekat*) and the pilgrimage (*hajj*). The seventh chapter, which concerns sacrifice and its types in Islam as an aspect of worship, can also be included within *ibadat* because sacrificing an animal at '*Eid al-Adha*' is a religious act. About 360 pages, or almost two thirds of the book, are devoted to explaining this dimension, (*ibadat*) of Islam. It is arguable that the decision to allocate such a large part of the book to matters of worship was made on the basis of their practical importance.

Chapters eight and nine offer a body of information dealing with Islamic ethics and moral obligations. The author briefly discusses the issue of the source of ethics and concludes that, without religious support, an ethical system cannot respond to the demands of the people. Only religious ethics, in other words, meet the requirements of the spiritual development of human beings. Chapter eight in particular provides guidance on the regulations a Muslim should or should not observe in personal life.

The final chapter is concerned with the history of the messengers mentioned in the Qur'an. These are mainly treated according to the Islamic sources. Priority is given to the Prophet Muhammad with the lives of 24 other prophets being narrated briefly.

The Features of the Ilmihal-Centred Approach

It is possible to identify five features of the Ilmihal-centred approach that have been, at least until the changes, discussed below, in 2000, very influential in the implementation of Turkish religious education. It is arguable that even now these features are powerful factors within the debates.

Contents of Teaching Islam and Turkish Secularism

The ilmihal approach stresses, through its selection of content, faith, worship and ethics; it ignores the social and political dimensions of Islam. To that extent, this emphasis may be described as a heresy by some Muslims who recognise Islam as a complete way of life, rather than a religion in the Western sense.

The prescribed content of ilmihal is certainly reflected in the present (pre-2000) content of textbooks for religious education in schools. The religious education curriculum has consistently included those aspects of Islam that affect the individual; and has excluded almost everything dealing with the social aspects of Islam. At this point, it should not be forgotten that those who select the content of the curriculum cannot fail to be influenced by the strong relationship between state policy and the content of education. Each curriculum area takes state policy into account in the selection of content. In a country where secularism has become a vital feature for education, as is now the case in Turkey, the secular state may prefer the teaching of doctrinal and ritual aspects that do not interfere with secular government policies (Tulasiewicz, 1993). It can be suggested that, by ignoring the social dimension of Islam and so in practice advocating individualistic religion, ilmihal does not contradict the Turkish understanding of secularism. Indeed, the outlook of ilmihal is consistent with the Turkish understanding of secularism.

In Turkey, the demarcation of the preaching of Islam permitted to the Presidency of Religious Affairs effectively draws the boundary between secularism and religion. According to the law entitled the Presidency of Religious Affairs (dated 1926) and subsequent legislation, the President's remit was restricted to the duties of administering the mosques and supervising the religious civil servants, together with the task of providing information on all matters concerning the beliefs, rituals and ethics of Islam (Tarhanli, 1993). The social aspect of Islam, *mu'amalat* (civil relations), was distinguished from both faith and ritual, and excluded from the scope of the Presidency of Religious Affairs. Ilmihal was, similarly, historically intended to inform and nurture the individual dimension of Muslims' religion rather than to provide detailed knowledge of Shari'ah, Islamic politics etc. Therefore, it might be justifiably be claimed that the lack of reference to the social aspect of Islam in the content of most school religious education textbooks implies a secular approach.

Confessional Approach

The ilmihal-centred approach follows a confessional approach for teaching religion. The term 'a confessional approach' refers to the overt teaching and strengthening of a particular religion, its doctrines and its way of life. It begins with the assumption that the aim of religious education is intellectual and cultic indoctrination. Ilmihal emphasises nurture in faith, assumes a common faith (Islam) as a point of departure, and is authoritative in its claims. In a sense, it is like a dialogue of believers who suffer from a lack of pedagogical dimension.

At the beginning of his first chapter, Bilmen describes a genuine (true) religion as 'a collection of divine commandments and regulations which was revealed by

God via his prophets' (Bilmen, 1996, p. 12). According to this account, religions are divided into three groups: divine religion, corrupted divine religion, and non-divine religion. For him, Islam is the only true divine religion, because other divine religions such as Judaism and Christianity have lost their original forms. He evaluates other religions apart from Judaism, Christianity and Islam as non-divine; they are religions that were somehow fabricated by human beings. In harmony with this classification, the whole book tries to demonstrate the implicit and/or explicit superiority of Islam over other religious traditions, and to advocate the nurturing of people in Islam. When it is necessary to compare one issue across religions, the author takes into consideration only Judaism and Christianity (in addition to Islam). For instance, in the last chapter of the ilmihal, in treating the life of Jesus, all the information is gathered from Islamic sources, and it is claimed that 'after Jesus Christianity changed and lost its authenticity, and Jesus was only a prophet' (Bilmen, 1996, p. 493).

Until very recently the religious education curriculum in Turkish schools has also advocated a confessional approach. The earlier primary and present secondary textbooks for religious education use exactly the same classification of religions as that outlined above. In this respect, religious education was probably the adaptation of the ilmihal approach with some amendments (Kaymakcan, 1999).

A Historical Form of Islam

The religious issues in the ilmihal have been discussed in the context of the past (and expressed generally in very abstract truths): little or no attempt has been made to find connections with contemporary religious life. Bilmen (1996) advocates following more closely the generally accepted comments of religious scholars who lived in the early years of Islamic history. This was seen as a virtue in Islam (Bilmen). The early period of certainty regarding the interpretations of, and discussions about, Islam has been presented without taking into consideration any current modern problems or living realities. Even some minor updating in order to understand an Islamic issue more accurately cannot be provided in the ilmihal. For example, in the section on alms (zakah) the old weight measures, such as dirhem and miskal, have been used to describe the limit of financial liability in almsgiving instead of the present weight measure, kilogram, in Turkey (Bilmen). It is also impossible to find any reference to the modern implementation of Islamic duties, or to ways in which (and to what extent) religion is influential in Turkey and the Islamic world. In short, the ilmihal shows little interest either in accommodating the living form of Islam and present day realities and problems or in the implications of living out daily life as an adherent of a religion.

In religious education in schools, textbooks are still mostly based on the promulgation of the historical form of Islam. There is, however, some improvement in presenting religion in such a way as to take account of its living form, as the recent primary religious education curriculum recommends, in order to build up a connection between everyday reality and religious principles. It is now widely

accepted that one of the aims of religious education is to make pupils aware of the religious dimension of life and to help them in the quest for meaning and purpose in their life. To do so, it is vital to find a link between religion and daily life. Religion is not only a historical reality; it is also a living fact.

Traditional Learning

The ilmihal aims to *transmit* a system of knowledge, beliefs and values. For it, everything has already been done by the earlier great scholars: our student's duty is to learn or memorise the ready-made knowledge about religion. It would be wrong to assume that the ilmihal encourages the learning or teaching of religion in the context of questioning and presenting a range of arguments on religious issues. According to its approach, reasoning in religious matters can be used only to understand deeply the wisdom of selected and authorised thoughts and interpretations of early Islamic scholars. This tendency may also be observed in the understanding of knowledge. The achievement of knowledge is described as attainable through learning the prescribed knowledge without scrutiny or criticism. The ilmihal discouraged the development and production of new comments and criticism in religious matters (Bilmen, 1996). In this respect, this understanding of, and attitude towards, knowledge are reminiscent of the late Ottoman madrasa tradition. According to Atay (1995), the pedagogy of late Ottoman madrasas was mainly based on teaching one opinion about any religious issue from one selected book, while discarding further opinions and genuine discussions. Different ideas about a particular issue were only introduced so that they could be refuted in order to support the approved opinion. Moreover, the fear of anything constituting unbelief (kufr), and the lack of critical evaluation of religious problems and ideas led to an increasing deterioration in the process of learning in the madrasa. (Gungor, 1981). It should also be noted that even the taxonomy of teaching Islam, both inside and outside schools in Turkey, has been deeply influenced by the madrasa understanding of Islam.

Religious education in Turkish schools tends to reflect the madrasa understanding of religion notwithstanding the fact that such an understanding has been strongly criticised by Turkish scholars and intellectuals. Of course, there have been some improvements in recent years with the development of educational science to make religious education more acceptable for the pedagogy of our time. On the whole, however, religious education has not provided a place for controversial issues either in the curriculum or in the textbooks, and there has been little in the way of efforts to promote the understanding of and questioning about religion.

Supremacy of Hanafi School of Thought

The teaching of one particular legal school is used to present Islam in the ilmihal. The ilmihal tradition overall argues that there is almost a consensus among Muslim scholars that the four Sunni schools of law are the only true and legitimate ways

to follow. Bilmen, in his *ilmihal*, assumes in fact that Turks are followers of the Hanafi legal school, and so he explains religious issues in terms of its methods and interpretations. While giving the fullest treatment and most extensive appraisal to the founder of the Hanafi school, Abu Hanifa, Bilmen outlines the significance and greatness of the founders of the four Sunni schools from a moral and intellectual point of view (Bilmen, 1996). If it is necessary to compare views on a particular topic, only those of other Sunni schools were used. There is a total disregard for other Islamic sects such as Shia. It seems, therefore, it is arguable that the *ilmihal* tries to give the impression that there is one accurate and final view about any Islamic issue; and further that this may lead to the denial of the possibility of other options in Islam. In reality, the existence of different degrees of diversity in religious traditions is a historical fact for every religion including Islam. In this, Islam is not exceptional. It is important to note a possible implication of holding the attitude, consciously or not, that there is only one legitimate interpretation of Islam: such a view might cause stagnation in Islamic thought. Atay (1995) has suggested that one reason for Islamic stagnation is the practice of looking at Islam and the main Islamic sources only through the eyes of the scholars of Islamic jurisprudence. If we understand Islam according to the Qur'an, rather than the narrow ways of scholar jurists alone, we can achieve a new religious mentality that helps to solve some of the problems of our age. In other words, it would not be wrong to assume that the chief authority in the *ilmihal*-centred approach is particularly the *ulema* (Islamic scholars) of jurisprudence.

As a consequence of the aforementioned attitude in Turkish religious understanding, the religious education course follows a similar pattern. The majority of religious topics, such as the five pillars of Islam, has been presented in line with a particular Islamic legal school, that of the Hanafis. Furthermore, just as the state has tried to conceal the fact of religious disagreement as far as possible by using Islam as a factor in support of national unity and a counter balance to the destabilising effects of modernisation problems; so too in religious education the policy has been to avoid all mention of controversial themes (Wielandt, 1993).

New Developments in Religious Education in Schools

The primary religious education curriculum, introduced in 2000, can be considered a significant shift from traditional religious understanding to modern religious education. The new religious education curriculum argues that the former religious education curriculum did not incorporate new developments both in educational sciences and in the religious (Islamic) understanding of the Turkish society. The new curriculum is designed to respond to new changes and challenges in religious understanding and in pedagogy. This new religious education approach has been called the 'Ankara Model' by the preparation committee (Dogan & Altaş, 2004). The reason for the choice of this name may stem from the fact that the members of the new religious education curriculum committee mainly work in, or are closely associated with, the University of Ankara. It should be noted that scholars from

the faculty of theology, particularly religious educationalists, have played a more pioneering role than ever before during the process of preparation of this curriculum. Two main features of this new RE model can be explained in terms of the Ankara Model.

Firstly, in the last two decades, Turkish theologians have produced scholarly studies that make a critical evaluation of the traditional understanding of religion and Islam. Using this approach, the Ankara style promotes critical thought about religious inheritance: and also retains a sense of the importance of the traditional experience of the religious culture. Moreover, it is claimed by the committee members that this approach supports the Qur'an-centred approach in the teaching of Islam rather than an ilmihal-centred approach. Pupils have direct access to the primary source of Islam, the Holy Qur'an, and get an opportunity to study their religious cultural heritage. The Ankara model advocates that the teachings of non-Islamic religions are introduced to the students on the basis of scientific knowledge about these religions. The new primary religious education curriculum tries to identify a common understanding of religion in society to avoid having to deal with controversial issues and diversity in Islam (Dogan & Altaş, 2004; Tosun, 2003).

Secondly, this new model argues that various new religious education approaches have been developed to take into account changes in educational science, society, and religious understanding. Since Turkey is a democratic, secular and social state, the model suggests that the new religious education curriculum should reflect more accurately these features. It understands religious education as 'inclusive religious teaching'. Some basic features of inclusive religious teaching can be listed as follows: non-denominational, inclusive of non-Islamic religions, and (recognising that Islam is part of Turkish culture) incorporating an emphasis on the cultural dimension of Islam. Such teaching also promotes problem or learner centred teaching rather than content-centred teaching (Dogan & Altaş, 2004).

This new understanding of religious education is exemplified in the presentation of Christianity in the new primary religious education curriculum. Firstly, the ilmihal-centred approach in religious education, as stated above, used a classification system that divides religions by origin (whether divine or non-divine); then subdivides divinely originated religions into distorted and undistorted religions. In this taxonomy, Christianity was considered as a distorted divinely originated religion. From the beginning, this indicates prejudice against Christianity. This kind of classification of religions cannot be detected in the new textbooks. Hence, this kind of approach can be considered a significant positive step for the understanding of Christianity and other world religions. Secondly, we find that the space given to non-Islamic religions in the new curriculum and textbooks is increased considerably. Thirdly, in discussing ethical issues and presenting ethical values, the new textbooks refer to and quote from the other Scriptures, including the Bible as well as the Qur'an. Fourthly, in contrast to the old textbooks, the new textbooks give some references to contemporary issues such as Christmas and missionary works. For example, while the activities of missionaries have been discussed recently in

Turkish media from several aspects, these textbooks present them in a descriptive and objective manner (Kaymakcan, 2003).

Conclusion

Religious education in schools is a sensitive issue in Turkey. Since the establishment of the Turkish republic, the status of religious education has been discussed in different contexts. Turkey has a very distinctive experience of religious education in schools: one that includes both the complete non-existence of religious education and the existence of compulsory religious education. After the subject gained compulsory status, discussions about its quality in schools came to the fore. The traditional ilmihal-centred approach has made a great impact on Turkish religious education in schools. This traditional approach is confessional, informative, educationally weak, and theological; it attempts to be consistent with the Turkish state's secular policy.

Almost all Turkish experts on religious education agree that the traditional way of teaching religions in schools is inadequate to meet the needs of pupils in society. However, although these experts criticise and find in it (the traditional teaching) many deficiencies, they at the moment cannot reach an agreement about an alternative way of teaching religion in schools. In the meanwhile, despite some shortcomings such as not providing religious diversity in religion, becoming too eclectic from the pedagogical point of view, and giving too much emphasis on the cognitive aspects of religion (while ignoring the affective dimension in theory and modelling), the Ankara model can be considered a new insight in terms of pluralistic and educational religious education in schools. However, it is too soon to predict what the Ankara model's future will be within religious education. In 2005 the Turkish Ministry of Education announced that all the school curriculum subjects will be changed in line with constructive learning theory. The future changes in curriculum of religious education in schools should be seen as part of significant shift in the pedagogical aspects of the whole of school education.

DEFINING AND PROMOTING THE STUDY OF RELIGION IN BRITISH AND AMERICAN SCHOOLS

Bruce Grelle

California State University, Chico

Introduction

Robert Jackson has noted that ‘the histories of religion and state relationships and of civil religion in different countries are key factors in shaping policy for the study of religions in the education systems of particular states’ (Jackson, 2005, p. 8). One of the most obvious indications of these historical, cultural, and legal differences can be found in the different names that are used to describe the study of religion in British and American schools. (FN1) ‘Religious education’ or ‘RE’ has become the agreed upon name for the subject matter in Britain and much of the rest of Europe, although this term encompasses a wide range of sometimes conflicting approaches to understanding the nature and aims of the study of religion in state-supported schools. Meanwhile, debate about how to describe the academic study of religion in public educational institutions in America is ongoing. As we shall see, a number of candidates for naming this discipline and subject-matter have been put forward, but at least for now, ‘religious education’ is not one of them because of this phrase’s unacceptable connotations in the context of United States (U.S.) history, culture, and law. In addition to what may well in the end amount to a rather superficial difference when it comes to describing the study of religion in British and American schools, there appear to be more substantial differences when it comes to the methods and aims of teaching about religion, when it comes to definitions of ‘religious literacy,’ and when it comes to the status of religion as a recognised subject-matter in the curriculum of state-supported schools and as an area of professional specialisation for teachers. In what follows, I will briefly explore some of these differences in how the study of religion is understood and practiced in British and American education. I will also observe that, despite some superficial and some not-so-superficial differences, there are

interesting and sometimes surprising parallels between what Jackson identifies as the main approaches to religious education and plurality in Britain (Jackson, 2004a) and corresponding approaches to religion and public education in the United States.

What's in a Name?

Argument over how to describe the academic study of the world's religions in public educational institutions in the United States is ongoing. In state colleges and universities, 'religious studies' has become the most common name for academic programs and departments devoted to the cross-cultural and historical study of religion, though one sometimes finds 'comparative religion' or just plain 'religion' programs or departments at such institutions as well. But as many religious studies students and professors are likely to tell you, the adjective 'religious' contributes to frequent misunderstandings of the nature and aims of these 'studies.' Indeed, one of the first challenges met by students who declare a major in religious studies is to decide how they will respond to their friends and relatives when asked if they plan to become a minister, priest, monk, nun, rabbi, or imam. While some students do plan to pursue such vocations, most do not, and they must figure out how to explain why they are interested in the subject and what they are going to 'do' with it. One wonders whether the persistence of this challenge may help to explain why more students do not choose to major in the field despite the fact that high enrolments in religious studies courses by non-majors seeking to fulfil general education requirements indicate a significant interest in the subject by college students.

Professors also face their share of misconceptions about scholarship and teaching in religious studies, more than are typical for their counterparts in history, philosophy, anthropology, or psychology. Despite the widespread institutionalisation of the cross-cultural and historical study of religion in American higher education over the past several decades, there are still some university faculty members, administrators, and members of the general public who do not seem fully to grasp that religion can be studied from a non-devotional and non-theological perspective. A recurrent topic when religious studies professors 'talk shop' is the question of how best to avoid starting a long and unwanted conversation when asked 'what do you do?' by a stranger at a party or on an airplane. Similarly, professors of religious studies must still sometimes endure colleagues who describe them as the 'God squad,' or who ask why they have not prayed for a change in the weather, or who wonder which religion or denomination they 'represent.' To be sure, these remarks are often made with tongue-in-cheek, but unfortunately it has been my experience that one cannot always assume this to be the case!

So why not find an alternative name for 'religious studies'? Although 'comparative religion' has enjoyed something of a resurgence in recent years, there are some who do not feel that it adequately describes the range of theories and methods encompassed by 'religious studies,' and others remain leery of the origins of

'comparative religion' in the context of Western imperialism and of its historical associations with Christian apologetics and missionary activities (Paden, 1994; Patton & Ray, 2000; Sharpe, 1975). As for the suggestion that the name for the academic department that studies religion should simply parallel the name for the departments that study philosophy or history, one is quickly reminded of the First Amendment constraints that set the context for the study of religion in public educational institutions in the United States – while departments of philosophy 'do' philosophy as well as teach about it; and while departments of history 'practice' history; religion may not be 'done' (practised, sponsored, promoted) in the same fashion by departments of religion. The situation is even more ambiguous in public elementary and secondary schools. Many Americans, both religionists and secularists, continue to hold the mistaken belief that the controversial Supreme Court decisions dealing with prayer and public schools in the 1960s mandated the removal of all references to religion from the school environment. This is despite the fact that the Supreme Court's decision in *Abington School District v. Schempp* (1963) made a clear distinction between school-sponsored religious practices, which were found to violate the establishment clause of the First Amendment to the U. S. Constitution, and the academic study of religion and the Bible, which was found to be consistent with First Amendment principles. As we will see, there is increasing recognition of the importance of including the topic of religion in the curriculum of public schools, but there also remains considerable confusion on the part of many teachers, parents, and members of the general public about what to teach regarding religion and how to do it. This confusion is illustrated and perhaps even caused in part by the fact that there simply is no agreed upon name or description for this subject matter in American elementary and secondary schools. Jackson (2004a) notes similar misunderstandings when it comes to 'religious education.' For example, some European educators and researchers in the fields of intercultural and human rights education have dismissed RE as a subject concerned with the propagation of a religious viewpoint. In England and in some other parts of Europe, the problem is exacerbated further by the fact that RE is an umbrella term that encompasses traditional Christian confessional and faith-based-schools approaches to the subject in addition to the more pluralistic multifaith approaches of the sort that Jackson advocates.

The simple fact is that when it comes to the study of religion in state sponsored schools, there is a problem with the adjective 'religious.' Despite the fact that in England the phrase 'religious education' originated as an alternative to traditional Christian 'religious instruction' (Jackson, 2004a), and despite the fact the 'religious studies' emerged in both the United States and Britain in order to designate an alternative to theological approaches to the study of religion in the context of higher education, the adjective 'religious' continues for many to connote a faith-based, pious, confessional, theological, or devotional way of teaching and learning. Religious education and religious studies continue to be confused with the inculcation of particular religious viewpoints. While most would agree that such a confessional approach is entirely appropriate within the context of a

religious community and its own educational institutions, a growing number of religious and non-religious parents, students, teachers, educational policy-makers, and citizens-at-large question the suitability of such an approach in state-supported schools that are increasingly populated by students from diverse cultural, ethnic, racial, and religious as well as non-religious backgrounds. As in the case of higher education, a number of alternative names for the subject in elementary and secondary schools have been suggested. The British Humanist Association has proposed renaming the subject matter 'Beliefs and Values Education.' (Jackson, 2004a). In a similar vein, Ninian Smart and Perry Glanzer have separately suggested 'worldview analysis,' and Nicholas Piediscalzi and his associates have proposed 'public education *religion* studies' (Glanzer, 2004; Piediscalzi, 1988; 1991; Smart, 1995; Will, Piediscalzi & Swyhart, 1981). Others have simply tried to combat the problem with the adjective, 'religious,' by insisting on the preposition, 'about.' In the context of public education, so this argument goes, one should always be careful to say 'teaching *about* religion,' never 'teaching religion'; always 'education *about* religion,' never 'religious education'. In this setting, the phrase, 'teaching about religion,' is understood to include 'consideration of the beliefs and practices of religions; the role of religion in history and contemporary society; and religious themes in music, art and literature' (Haynes & Thomas, 2001, p. 89).

For the time being we appear to be stuck with this terminological ambiguity. Regardless of what label we ultimately choose to describe the academic study of religion in public schools, the more important challenge we face is that of distinguishing between appropriate and inappropriate ways of approaching religion and plurality in view of the unique national, cultural, and legal circumstances in which we find ourselves.

Approaches to Religion, Plurality, and 'Religious Literacy'

One of the things that Robert Jackson's *Rethinking Religious Education and Plurality* (2004a) makes clear is just how far behind Europe the United States is when it comes to theory and research on the place of religion in the curriculum of elementary and secondary education, let alone when it comes to the institutionalisation and practice of teaching about religion in public schools. For example, in England and Wales and some other parts of Europe, RE is a well-established subject matter in the curriculum and an area of professional specialisation for which teachers can become certificated. In the United States, despite the rare secondary school elective class on the Bible as Literature or the even rarer class on world religions, teaching about religion—when it happens at all—is typically incorporated within history and social studies, and most teachers in these fields have had no formal training in the academic study of religion as part of their professional preparation. History and social studies textbooks have only very recently begun to include the topic of religion and still tend to give it only minimal attention (Nord, 1995; Nord & Haynes, 1998).

Nonetheless, in the past twenty years there has been some movement in the United States toward inclusion of religion in the curriculum of public schools. During this time, both the National Council for the Social Studies (1984) and the Association for Supervision and Curriculum Development (1988) issued statements calling for more attention to be given to religion, and a recent analysis of national and state social studies standards has documented that nearly all fifty states now include the topic in some fashion or another (Douglass, 2000). Indeed, since the late 1980s something of a 'new consensus' has emerged regarding the questions of why and how study about religion should be incorporated within public schools (Beauchamp, 2002; Nord & Haynes, 1998).

This new consensus was heralded by the 1988 publication, 'Religion in the Public School Curriculum: Questions and Answers,' a statement of principles endorsed by a remarkably broad range of educational, religious, and civic organisations (Reprinted in Haynes & Thomas, 2001, pp. 87–92). This statement recognised that knowledge about religion is not only essential for understanding history, culture, and society in the United States and around the world, it is also an integral part of education for democratic citizenship in a pluralistic society. Not only is there a growing consensus about why the topic of religion should be included in the curriculum, there is also significant agreement regarding basic pedagogical guidelines for *how* to teach about religion in public schools. Rooted in the religious liberty principles of the First Amendment to the United States Constitution, these guidelines reflect current law regarding religion and public education, and they have been distributed to every public school in the nation by the United States Department of Education (Beauchamp, 2002). At the foundation of these guidelines is a sharp distinction between teaching *about* religion in public schools on the one hand, and the promotion of religion or religious indoctrination on the other hand. According to the guidelines,

- The school's approach to religion is *academic*, not *devotional*.
- The school strives for student *awareness* of religions, but does not press for student *acceptance* of any religion.
- The school sponsors *study* about religion, not the *practice* of religion.
- The school may *expose* students to a diversity of religious views, but may not *impose* any particular view.
- The school *educates* about all religions, it does not *promote* or *denigrate* religion.
- The school *informs* students about various beliefs; it does not seek to *conform* students to any particular belief (Reprinted in Haynes & Thomas, 2001, pp. 75–76).

While these consensus guidelines do not provide a full-fledged theoretical and pedagogical framework on a par with those discussed by Jackson, they do suggest a general orientation to the study of religion that can be related to approaches in England and Wales.

Jackson's (2004a) *Rethinking Religious Education and Plurality* analyses several major approaches to RE: the traditional Christian confessional approach; the faith-based-schools approach; the personal narrative approach; the religious literacy

approach; the interpretive approach; and the dialogical approach. He also discusses what might be described as a secularist 'anti-approach' to RE, which advocates that RE be relegated to faith-based education and eliminated from all other state-supported schools. Although we cannot go into it here, it is interesting to observe that several of these approaches to RE in Britain have rough counterparts in the United States. For example, the approach to religion and public education advocated by such American groups as the National Council on Bible Curriculum in Public Schools and David Barton's 'Wallbuilders' organisation parallels the traditional Christian confessional approach in Britain. In each case there is the view that state-supported schools should respond to the increasing secularisation of society and to the burgeoning diversity of religious viewpoints and communities by transmitting a nostalgic version of the nation's Christian heritage. (Baptist Joint Committee, n.d.; Levenson, 2002; Miller, 1995; National Council on Bible Curriculum in Public Schools, n.d.; Schaeffer & Minceberg, 2000; Wallbuilders, n.d.) Similarly, there is a parallel between the faith-based-schools approach in England and the movement for school vouchers in the United States, which would direct public funds to private religious schools.

Of the major approaches discussed in Jackson's 2004 book, the American consensus approach most closely resembles what he describes as a 'family' of pluralistic approaches to multifaith RE that includes the religious literacy, interpretive, and dialogical approaches. Like these, the American consensus approach stands outside any particular system of religious beliefs and adopts an inclusive response to plurality. (Jackson, 2004b). That is, it seeks to promote understanding of the religious and non-religious worldviews of others, and it assumes that 'no one should be marginalised from the subject because their position is conservative or radical, secular or religious...' (Jackson, 2004a, p. 86). Religion is not approached as self-evident or publicly agreed truth, but as a form of knowledge or way of seeing the world and as a distinctive area of human experience. Like the British approaches to multifaith RE that emerged in the 1970s, the primary aim of teaching about religion in American public schools has been to increase pupils' understanding of different religions in history and society. A closely related aim has been to increase tolerance and sensitivity toward people of different faiths as well as toward those who are affiliated with no particular religious faith (Jackson, 1997).

Yet despite these similarities, what most clearly distinguishes the American approach from these British approaches is its insistence on the sharp distinction between teaching *about* religion on the one hand, and religious 'nurture' or 'edification' on the other hand. To be sure, this distinction is recognised by the religious literacy, interpretive, and dialogical approaches to RE, but it is intentionally blurred. For these three approaches, multifaith RE is not only about understanding others, it is also concerned with relating material studied in class to students' own beliefs and assumptions; it is concerned with helping young people to clarify and develop their own views and beliefs (Jackson, 1997) and with the development of their own religious or spiritual identities (Jackson, 2004a). As Jackson writes in *Religious education: An interpretive approach*,

From the perspective of religious education theory, the research challenges the sharp distinction generally made between religious education and religious nurture. The current orthodoxy...was to draw a sharp distinction between religious education (non-dogmatic and with the aim of increasing understanding) and religious nurture, a term used...to connote the transmission of religious culture from one generation to the next within faith traditions....[R]eligious nurture was perceived as 'confessional' while religious education was presented as 'educational' (Jackson, 1997, p. 4).

It is important to understand that religious nurture and edification are not the same thing as indoctrination or the inculcation of particular religious beliefs. Pluralistic approaches to multifaith RE in Britain are no more aiming to convert or indoctrinate students than the American consensus approach is. But a persistent theme in the RE literature is the question of whether and how religious education and religious nurture – the transmission of religious culture – might complement one another (Jackson, 1997). These British approaches both acknowledge and cultivate a connection between 'learning about' and 'learning from' religion, with the result that 'religious understanding' becomes 'simultaneously academic and personal.' (Wright, as cited in Jackson, 2004a). More specifically, Jackson discusses the potential role of RE in the 'edification' of students. He stresses the inevitable relationship that exists between students' own experiences and the experiences of those whose beliefs, values, and ways of life they are attempting to understand:

Thus the activity of grasping another's way of life is inseparable in practice from that of pondering on the issues and questions raised by it. Such reflective activity is personal to the student. Teachers cannot delay the process of reflection to a later date, just as they cannot guarantee that it will happen. They can, however, enable it by providing structured opportunities for reflection ... (Jackson, 1997, p. 130).

On this view, RE is potentially transformative of the student's own religious self-understanding, and a good bit of attention is devoted to how RE teachers can 'enable' such transformations. Engagement in 'conversations' with different worldviews and ways of life sometimes leads students to reassess their own worldviews and ways of life. 'To be edified, in this sense, is to be taken out of one's own self. Through the challenge of 'unpacking' another worldview one can, in a sense, become a new person' (Rorty as cited in Jackson, 1997, p. 130–131; cf. Jackson, 2004b). Thus, as Jackson sees it, the promotion of 'religious literacy' involves efforts 'to help each pupil to identify with and argue for a particular religious or non-religious position' and to help students 'find their own positions within the key debates about religious plurality' (Jackson, 2005, p. 6). This goal is shared not only by the 'religious literacy' approach per se, but by the 'interpretive' and 'dialogical' approaches as well.

In contrast, teaching about religion in American public schools cannot be geared toward students' religious edification and nurture—even a non-traditional and

pluralistic form of religious nurture—because the First Amendment requires public schools to be neutral toward religion. This not only means that they may not promote or denigrate any *particular* religious faith, but also that they may not promote or discourage religious faith *in general*. Apart from this legal barrier to the inclusion of ‘existential’ or ‘spiritual’ aims as a component of religious literacy, there are cultural ones as well. I think that Warren Nord is right to suggest that while Jackson’s view of the potentially transformative implications of study about religion may be acceptable when it comes to secondary schools and undergraduate education, in the United States ‘there would be powerful resistance to any public profession that the purpose of education in elementary schools is to redefine religious identities’ (Nord, 2005, p. 13). Indeed, it has been my own experience that there is often parental resistance to such a notion even at the level of secondary education.

In the setting of American public schools, when the term is used at all, ‘religious literacy’ most typically refers to a student’s mastery of certain basic information about the world’s religions, and as such it tends to be viewed as a dimension or component of a broader conception of cultural and historical literacy. While there is a growing literature in the United States on education and spirituality, much of it relates to post-secondary education or to private rather than public schools (see for example, Blacher-Wilson, 2004; Denton, 2004; Hulett, 2004). Thus, for the time being, the inclusion of this ‘existential’ or ‘spiritual’ aim as a component of religious literacy in Britain and its exclusion in the United States is one of the most significant differences between the study of religion in British and American schools.

Interpretation, Representation, and Reflexivity

At this point I think we can begin to see that the American consensus approach to the study of religion in public schools more closely resembles what Jackson describes as the ‘phenomenological’ or ‘world religions’ approach than it does any of the other major approaches discussed so far. While Jackson’s 2004 book mentions the phenomenological approach only in passing, he analyses it at great length in his earlier work, *Religious education: An interpretive approach* (Jackson, 1997).

Within the British context, the phenomenological approach is most closely identified with Ninian Smart and the 1970s Lancaster Schools Council Project (Jackson, 1997). Like the American consensus approach, this approach sees the primary aim of education about religion as the promotion of understanding. ‘It uses the tools of scholarship in order to enter into an empathic experience of the faith of individuals and groups’ (Schools Council, as cited in Jackson, 1997, p. 8). Jackson notes that an influential British government report has advocated the phenomenological approach as the most appropriate one for a democratic and pluralistic society, because it seeks ‘to teach children to understand the nature of beliefs and a range of belief systems...and to ‘inform’ rather than ‘convert’ pupils.’ (Swann, as cited in

Jackson, 1997, p. 9) In words reminiscent of the American consensus statements, this government report states that

It is...the function of the school [*as distinct from home and community*] to assist pupils to understand the nature of religion and to know something of the diversity of belief systems, their significance for individuals and how these bear on the community (Swann, 1985, cited in Jackson, 1997, p. 9. Words in parentheses added by Jackson).

Jackson is generally sympathetic to the phenomenological approach. Even though his own approach is more directly influenced by recent work in interpretive anthropology and ethnography, he acknowledges that it shares some features in common with the 'new style' phenomenology of Dutch scholar Jacques Waardenburg (Jackson, 1997, 2004b).

Nonetheless, when it comes to issues of *representation*, *interpretation*, and *reflexivity* in the study of religion, Jackson believes that both the phenomenological and religious literacy approaches exhibit some significant weaknesses, and I believe that the American consensus approach suffers from these weaknesses as well, if not necessarily in principle then at least in terms of current classroom practice. While it is not possible here to do justice to Jackson's thoroughgoing discussion of these issues, I do want to suggest why it is important for American educators to give them more attention than they typically have done up until now.

First, with respect to the issue of reflexivity—the issue of 'being aware of one's own self and personal and social understandings in interpreting the testimony of someone from another way of life' (Jackson, 1997, p. 30)—we have already noted what Jackson regards as the negative pedagogical implications of asking students and teachers to 'bracket' their own personal religious identities and existential questions. By striving for an objective and neutral approach to the study of religion that sets aside one's own presuppositions, experiences, and questions, there is great risk of undermining students' sense of the relevance of the subject matter and its connection to their own personal lives. This pedagogical challenge of making the subject matter 'come alive' for students is exacerbated in the United States where many believe that techniques such as role-playing and simulations in connection with the topic of religion are to be discouraged in public schools (see Council on Islamic Education, 2003; Hill, 2004). As we have seen, the legal and cultural situation in the United States is such that the study of religion in public schools cannot be approached primarily from the perspective of students' and teachers' own personal religious narratives and experiences. While there is considerable latitude for student religious expression in the school environment, current law allows much less latitude for religious expression on the part of teachers, and in the context of the school curriculum both students and teachers are to approach religion in an 'academic' rather than an 'existential' manner (see Haynes & Thomas, 2001, pp. 113–132). Clearly, there needs to be more attention given to how the subject matter can be connected to the lives and experiences of students without violating the spirit of objectivity and neutrality that is so critical in the American setting.

I believe that one way to make this personal connection is to focus more directly and explicitly on the linkage between knowledge about the world's religions and exercise of the rights and responsibilities of citizenship in a pluralistic democracy, and I will return to this issue below.

Besides these pedagogical challenges, there are deeper theoretical issues that are raised in connection with the issue of reflexivity. Jackson (1997, pp. 49–55) is troubled by many religious educators' lack of critical attention to how Western ideas about religion in general, and about separate 'world religions' in particular, have been formed. He reminds us of the specific historical and cultural circumstances in which the concepts of 'religion' and 'religions' originated and developed, and he notes that in the process of bracketing or setting aside presuppositions it is easy to lose sight of the extent to which one's own terminology and systems of classification may be inappropriately transposed from one context to another. The study of religion in schools still too often amounts to taking such Western and Christian concepts as God, salvation, revelation, sacrifice, prayer, and saviour and looking for their equivalents in 'other' religions. As Jackson (1997, pp. 55–57) explains, the issue here is not simply the potential for misunderstanding the material that one is studying, there is also an issue of the relationship between knowledge and power. Too often our taken-for-granted assumptions have originated in the context of unjust patterns of power and authority and have been used to legitimate and perpetuate these same patterns; too often they have conveyed inaccurate images of religions and cultures; too often they have perpetuated stereotypes of ourselves and others. Jackson's insistence on greater conceptual and methodological self-consciousness and self-criticism in the study of religion on the part of both teachers and students is certainly as applicable in the United States as it is in Britain.

With regard to the *representation* and *interpretation* of religions and cultures in history and contemporary society, Jackson (1997) faults both the phenomenological and the religious literacy approaches for their tendency to portray religions as whole, discrete, and relatively stable systems of belief rather than as internally diverse, fluid, and historically dynamic traditions. I fear that most teaching about religion in American public schools is susceptible to this same criticism. As Warren Nord (2005, p. 14) observes, 'American world history textbooks typically freeze world religions in their so-called classical forms, and then pretty much ignore their development over time.' Likewise, curriculum frameworks and standards tend to concentrate on the origins and basic tenets of religions and largely neglect their historical, cultural, and contemporary variations. Such static portrayals risk leaving students with the impression that religions are relics of ancient history rather than vital parts of contemporary life for millions of people around the world.

Closely related to this reified view of religions as static and clearly bounded systems of belief is a 'failure to recognise the internal plurality of religious traditions, and the diversity of discourse within them' (Jackson, 2004a, p. 83). Much teaching about religion is insufficiently attentive to 'contested representations within traditions or to disputed borders' (Jackson, 2004a, p. 81). The problem with this is that 'idiosyncrasy' and 'hybridity' are filtered out; 'the fuzzy edges of real life

are trimmed off, and the personal syntheses and multiple allegiances revealed by ethnographic study are interpreted as deviations from doctrinally pristine religious narratives' (Jackson, 2004a, pp. 81–82). The interpretive and dialogical approaches developed by Jackson and his colleagues at the University of Warwick have sought to overcome this problem by focusing not only on historical representations of religious beliefs and practices, but also on case studies of contemporary religious cultures and sub-cultures as well as on pupils' experiences of religion (or its absence) in their own lives and in the lives of those around them. Increased use of ethnographic case studies of 'living' religious communities is something that I think would be entirely appropriate when teaching about religion in American public schools.

Here we return to the question of how the study of religion might be made relevant to the personal lives of students. If teaching geared toward the religious nurture and edification of students is inappropriate in the United States, how else might we cultivate a personal connection with the subject matter? It has been my own experience working with American college students that they are very curious about the religious and cultural diversity they encounter in their own communities and in the media. Many elementary and secondary school teachers with whom I have worked confirm that their pupils are also interested in the diversity they see around them. By focusing on living religious communities—beliefs, customs, ceremonies, holidays, styles of dress and artistic expression, patterns of family life, etc.—it is possible to make the subject matter come alive for students, not so much in the context of developing their own spiritual identities but in the context of developing their identities as citizens of a pluralistic democracy. Teaching about diverse religious and secular worldviews and ways of life becomes a venue for helping students understand their rights to religious liberty or freedom of conscience as well as their responsibility to protect those same rights for their fellow citizens. By learning about and engaging the differences between religions and cultures in contemporary society as well as in history, students come to understand and cultivate the spirit of respectfulness and civility that is essential for participation in the ongoing conversations, arguments, and debates that constitute public life in a democratic society. Such a view of the aims of teaching about religion in public schools is the basis of 3 Rs Projects (Rights, Responsibility, Respect) in California and Utah (see Haynes & Thomas, 2001, p. 63) and is very much in keeping with Jackson's observations regarding the contributions that RE can make to citizenship education (Jackson, 2004a).

Conclusion

Robert Jackson's discussions of representation, interpretation, and reflexivity in the study of religion are situated not only in the context of recent educational research, but also in the context of contemporary debates within social and cultural anthropology and religious studies. While issues and debates such as these are at the very heart of recent scholarship and teaching in religious studies in the context

of American higher education, they are, with few exceptions, all but absent from discussions of teaching about religion in public elementary and secondary schools. Indeed, as Warren Nord muses, it almost seems like an idle luxury to worry about such issues in the American context where students are lucky to be exposed to even the most basic information about the world's religions, let alone to careful accounts of historical change, internal diversity, and reflexivity (see Nord, 2005, p. 14). For all the progress over the past twenty years, teaching about religion is still peripheral to most teacher education programs and still insufficiently integrated into the curriculum of most public schools. Discussions of religion and public education in the United States are still in an early phase of development, and it will likely be a long time before they achieve the level of theoretical and methodological self-consciousness and sophistication, backed-up by extensive empirical research, that characterises discussions of the topic in Britain and some of the rest of Europe.

Having said this, however, let me conclude by acknowledging some bright spots on the horizon. I just mentioned that, *with few exceptions*, the sorts of theoretical and pedagogical issues addressed by Jackson are all but absent from discussions of teaching about religion in American schools. But the exceptions are significant. The Program in Religion and Secondary Education at Harvard Divinity School (n.d.), and more recently, the Religion and Public Education Resource Centre at California State University, Chico (n.d.) have pioneered the incorporation of these issues in teacher education. The National Endowment for the Humanities has sponsored periodic institutes and seminars on religion for teachers seeking opportunities for professional development in this area, and organisations such as Religious Studies in Secondary Schools (n.d.) and the Council for Spiritual and Ethical Education (n.d.), though made up primarily of teachers from private independent and religious schools where religious studies is an established subject matter in the curriculum, have nonetheless developed many curricular and pedagogical resources that might be usefully adapted to the public school setting. The work of the First Amendment Centre and its 3 Rs Projects has strengthened the connection between the study of religion and civic education and has advanced public understanding of constitutionally appropriate and educationally sound ways of dealing with religion in the public schools. Along with the ongoing publication of the journal *Religion & Education* (<http://fp.uni.edu/jrae/>), there is a growing body of scholarship devoted to advancing the discussion of religion and public education in the United States. (Fraser, 1999; Gaddy, Hall & Marzano, 1996; Haynes & Thomas, 2001; Marty & Moore, 2000; Nash, 1999; Nord, 1995; Nord & Haynes, 1998; Piediscalzi, 1988, 1991; Sears & Carper, 1988). And finally, the American Academy of Religion's formation of a Religion in the Schools Task Force (n.d.) indicates an increasing commitment on the part of college- and university-based scholars to engage in conversation and collaboration with school teachers regarding the unique challenges presented by the study of religion in elementary and secondary schools. This task force sponsored a panel on 'Rethinking Religious Education and Plurality in Europe and the United States' at the American Academy of Religion's annual meeting in 2004, and this panel provided the basis for a special focus section in *Religion &*

Education in Spring 2005. Hopefully this is only the beginning of a more sustained interaction and dialogue between American educators and their British and other European counterparts regarding the study of religion in state-supported schools.

Acknowledgement

Notes

In this essay I consider Robert Jackson's work, which addresses recent developments in religious education in England and Wales. As he points out, Scotland and Northern Ireland have different systems. When I use the terms 'Britain' and 'British' for ease of expression, I am referring specifically to the English and Welsh developments addressed by Jackson.

TEACHING ABOUT RELIGION AT SCHOOL IN FRANCE

Mireille Estivalèzes

Historian and Sociologist of Religions

Introduction

France stands apart from other European countries in the twenty-first century in that it does not provide religious instruction in school. Since laws on the laicisation of education were adopted at the end of the nineteenth century, it is no longer possible to carry out religious instruction during school hours and on school premises. Yet 100 years after such laws were introduced, we are seeing the beginning of a social debate on the lack of religious knowledge among young people and the means of correcting this. Although this does not entail reintroducing religious instruction, there is an urgent need to provide students with better information on religions both to support them in their lives as citizens and to provide them with a more balanced education.

Before going any further, ‘teaching about religion’—a term, more and more used in social debate, and now the accepted term—needs to be defined. ‘Religion’ here refers to a social matter, a human reality, within a historical and geographical context. ‘Teaching about’ points to a scientific, that is to say an academic approach to study. Teaching about religion is therefore a subject of knowledge, a means of understanding civilizations and societies. What distinguishes it is that it restricts itself to what can be observed: ‘Fact is an irrefutable starting point. Buddhism arrived in Japan in the eighteenth century, it is a fact. Muslims believe that Muhammad was sent from God and that the Koran is uncreated, it is also a fact (Debray, 2002b, p. 173). This approach has the advantage that religion, being considered as part of culture, is then studied within the field of existing subject areas. However, the problem with this view is that it can reduce religion only to what can be observed, such as rites, architecture, social gatherings without taking symbolic and spiritual dimensions into account.

Before showing how religion is considered by the French education system, and mentioning the possible problems of teaching this subject, it is worthwhile recalling,

on the one hand, the French lay context and, on the other, the major stages of reflection on this issue, which have been accelerating over the last fifteen years.

The French Context

Within the process of the historical construction of laicity (French: *laïcité*) (Baubérot, 1990, 2004), the laicisation of education was one of the first manifestations of the political will of the Third French Republic in its desire to laicise civil society; this precedes by several years the separation of the Churches and the State instituted by the law of 12 December 1905.

This educational laicity took place in two steps and on two levels: at programme level and at staff level. While Jules Ferry was Minister for Public Instruction, the law of 16 June 1881 made primary schooling free; the law of 28 March 1882 made it compulsory and lay. Religious instruction was then removed from the curriculum. However, it was henceforth provided outside school hours and outside school premises and one day per week was set aside for children to receive religious instruction. Within the school, this subject was replaced by lessons on moral and civic instruction.

The law of 30 October 1886 states that in primary schools ‘teaching is exclusively carried out by lay staff’ (Estivalèzes, 2005b, p. 226). The religious neutrality of the content of teaching, just like that of teachers themselves, was stressed. Teachers at primary and secondary level were henceforth obliged to be neutral in terms of philosophy, religion and politics; they could neither preach nor systematically criticize religions, but had to respect their students’ freedom of conscience.

Religious instruction, considered now as a private matter, was then handed over to priests and the family. The above mentioned laws were, therefore, not anti-religious—for one of the concerns of Jules Ferry was to enable children and parents to exercise their religious freedom, yet not within the context of school—but their aim was rather to separate the public sphere from the private sphere.

Although laicity confined religious convictions to the private, family or parish sphere, it did not prohibit the discussion of religious issues within the context of school subjects. It would appear impossible to study the history of societies and civilizations or to approach major literary texts without mentioning religions. Furthermore, from 1908 onwards, one of Jules Ferry’s close colleagues, Ferdinand Buisson, wanted the history of religions to be taught firstly in French universities, in particular to research students, and secondly in schools, to enable students to understand better the history of civilizations and to encourage ‘a wide-ranging friendship, a respectful admiration for all manifestations of thought and of conscience’, and also to combat contempt and intolerance (Buisson, as cited in Gauthier, 1991).

However, it has to be pointed out that France has witnessed some major upheavals over the past thirty years. First of all, in the field of education, teachers have experienced a crisis in the humanities that provide, alongside classical Graeco-Latin culture and literary culture, knowledge about religion: a decline in the transmission of general education. Secondly, in the context of religion, there is a crisis in the social

frameworks for transmitting religion (a decline in religious practices; a decrease in the number of children attending lessons on religious instruction; a breakdown in the transmission of religion within the family) that has resulted in a significant religious deculturation of French society. Together, these two crises are largely responsible for the absence of a religious culture evident in young people.

History of a Debate

We are not concerned here with a detailed description of the issue, but only with some of the landmarks of the debate on teaching about religion in school. It was during the 1980s, through the press in particular, that genuine concern was voiced by various participants in the education system about the lack of religious culture among students. In particular, teachers found it impossible to conduct classes in which their students had to approach a certain number of literary, historical, philosophical or artistic topics, because their students did not have the necessary cultural references. This absence of religious culture, which seems to run deep, affected young people's approach to their religious affiliation, whatever their level of education, in secondary schools or universities. It has quite simply become more and more difficult for teachers to work with their students. How in literature can one read and appreciate Pascal, Racine, *Tartuffe* or *Don Juan* by Moliere, Victor Hugo, Claudel, Voltaire's attack against the Church, the poetry of Baudelaire or that of Verlaine without at least a basic knowledge of religion? How does one approach history without dealing with religion in history and, therefore, without understanding the basics of the main religions? What is the point of talking about ecclesiastical communities in the Middle Ages when students do not know what the message of Christianity is? Or how does one explore Muslim expansion if students know nothing about the main principles of Islam? How does one teach metaphysics in philosophy, if students do not know the meaning of such words as 'grace', 'faith' or 'salvation'? How does one talk to them about Descartes or Kant? It is difficult to appreciate the history of European art, architecture and music, at least until the eighteenth century, without a minimum of religious culture, whether this entails understanding medieval painting (full of passions, resurrections, Madonnas, miracles and saints), cathedrals, or sacred music such as the work of Mozart or Bach.

Opinion polls, seminars and debates from the 1980s revealed a lack of religious culture, no longer only among young people, but also in adults, including teachers. For example, the SOFRES poll for the *Encyclopaedia* (Baubérot 1990, p. 153) showed that only 15% were able to name the four evangelists in Christianity. It also indicated that a significant minority admitted to lacking religious instruction (44% in the 18/24 age group, 40% in the 25/34 age group, 38% in the 35/49 age group and 26% of those aged 65 and over). In the same survey, approximately 65% of the French were, at the end of the 1980s, highly or rather, in favour of teaching the history of religions: but there were differences in the purposes and the meaning of such teaching. For some, the objective was essentially moral (with the emphasis on transmitting values of honesty, faithfulness, etc.); and 42% thought that it would

help develop a spirit of tolerance in young people. For others, the objective was to place the subject in the wider historical and sociological context, and was therefore, by definition, highly cultural: some 35% believed it would foster the growth of general culture and 26% that it was important for young people to know their roots.

In 1988, the Ministry of National Education asked the historian Philippe Joutard to review the teaching of history, geography and the social sciences. In his report, he underlined the need to remedy the absence of religious culture by raising the profile of the history of religions in teaching about history, geography and literature, and by showing 'the importance of teaching about religion in history and its permanence in contemporary society' and by 'adding religion to cultural life and the civilization of daily life' (Joutard, 1990, p. 83).

In November 1991, a large seminar was organised at Besançon (Centre régional de documentation pédagogique, 1992) on the theme of 'A lay approach to the teaching of the history of religions', which brought together the principal social actors such as university staff, teaching experts and teachers from the private and public sectors. Its purpose was to conduct a debate on the practical methods of such teaching. What emerged was the rejection of a proposal, from some university staff, for the creation of a specific course for teaching the history of religions by a specialist which adopted an academic and lay approach towards religion, similar to the one used in the *École pratique des hautes études*. This was not acceptable to all for practical and ideological reasons. Instead, the strategy advocated was that of the acquisition of religious knowledge within existing school subject areas; and in particular of enriching the history syllabus by spending more time on the history of religions. This was to take place in the context of the reform of the curriculum to be progressively introduced in secondary schools from the start of the school year in 1996.

In 2000, an opinion poll for *Le Monde-Notre Histoire* (Estivalèzes M., 2000; Guibert, N. & Ternisien X., 2000) showed that 57% of those polled were in favour of teaching the history of religion (a decrease of 8% compared to 1988). Some 74% of these thought that it would improve the students' general level of education, and 69% their spirit of tolerance (a significant increase in comparison with 1988). This did give rise to some concerns however: 51% feared that it would create tension on the school premises, and 46% that this course would be a threat to the spirit of laicism.

The events of 11 September 2001 had an immediate impact on schools in as much as teachers were overwhelmed by questions from their students on religions and fundamentalisms. The Minister of National Education entrusted the philosopher Régis Debray with the task of investigating the state of teaching about religion in the lay school system, and putting forward some proposals. He presented his conclusions in March 2002. Following up reports about the absence of religious culture and the crisis in classical culture and the humanities, he believed that, beyond the concept of heritage, it was necessary to provide the means of understanding contemporary society. He concluded that teachers of the subject areas concerned—history, literature, philosophy and languages—needed to be better trained and

informed at the academic, intellectual and teaching method levels. He stressed the difference between religion as a cultural influence, ‘under the responsibility of Public Instruction, which is obliged to examine the contribution of various religions to the symbolic institution of humanity’, and religion as an object of worship ‘requiring a personal act of will, within the context of private associations’ (Debray, 2002a, p. 28). He also called for a ‘laicity of incompetence (i.e. religion does not concern us) to become a laicity of intelligence (i.e. it is our duty to understand it) (Debray, 2002a, p. 43). He concluded with twelve recommendations, including the creation of a module for teachers during their early training on ‘the philosophy of laicity and teaching about religion’ (Debray, 2002a, pp. 50–51). He also proposed improving the in-service training of teachers and advocated the creation of a European Institute for Religious Studies.

There is general agreement now in France about the necessity of taking the teaching about religion into consideration. As such, the Stasi Commission offers a ‘reasonable approach to religion as a fact of civilization’ (Stasi, 2004, p. 137) in order to give a better understanding of different cultures. Recently, in February 2005, when there was political debate about the law for the future of the school, Jean-Pierre Brard, a communist deputy, proposed a text dealing with how to organise the teaching of religion at school which, he argued, is ‘necessary to understand the existing world and enables access to culture and the arts’ (Estivalèzes, 2005a, p. 305). This amendment was approved by nearly all the deputies.

The Issues in Such Teaching

There is consensus around three principal objectives for improving the status of teaching about religions in schools – objectives that had remained more or less the same since the start of the social debate.

Access to the Cultural Heritage and its Symbolism

To remedy the absence of religious culture already identified, information must be provided for a better understanding of religions, and this applies as much to religious buildings—churches, cathedrals, monasteries, synagogues, mosques—as to painting, sculpture, stained-glass windows or a musical requiem. French society bears the traces of a deeply Christian past, in particular through its many artistic expressions (architecture, painting, music, literature, etc.), but also through the reference points of life in society (the calendar, public holidays, etc.). Yet for young people, the religious and symbolic dimension of this cultural heritage has now become to a certain extent incomprehensible.

Schools could play an important role in making the Western cultural heritage accessible to contemporary young people by providing them with the necessary keys to understand it. As religions are full of symbols, this also entails helping students to think in terms of these symbols, a process with which they are generally unfamiliar.

To Develop Education of Tolerance

French society is multicultural and pluri-confessional. Islam is its second religion in terms of the number of the faithful (about 4 to 5 millions registered); there are also large Jewish communities (600,000 people) or Buddhists (500,000 followers, 1 million supporters). It is very often the case that, at best, we do not understand, and at worst, we are unaware of, we criticise or we misunderstand those with whom we are unfamiliar. Yet schools should extend exactly the same welcome to children of different cultural religious and ideological backgrounds. It is the ideal place where mutual respect is learned, starting with mutual knowledge, in keeping with article 26.2 of the Universal Declaration of Human Rights of 1948: 'Education shall promote understanding, tolerance and friendship among all nations, racial or religious groups.'

Faced with the risk of intolerance, schools would seem to have an important role to play. They could defuse religious issues, promote better and greater understanding, and therefore educate tolerance by means of a cultural and social approach to religions, mainly Christianity, Judaism, Islam and Buddhism.

This could facilitate greater integration of minorities, alleviate tensions, promote respect for consciences and differences, and promote meetings and dialogue. It is also consistent with one of the main priorities of the French Ministry of National Education, which is to reassert the value of citizenship education.

To Promote Understanding of the Contemporary World

Another challenge is to better understand what is happening in the world, which, in our age, mainly due to globalisation and the media, is not limited to what is happening in our immediate vicinity—the events of 11 September 2001 and their consequences being a recent example.

Regularly, if not daily, we are reminded how important religions are in world affairs, in particular in the field of geopolitics. However, most of the time the media only mention religions in the case of spectacular, often violent events (the conflicts between Israel and the Palestinians; Muslim fundamentalist terrorism: confrontations between Hindus and Muslims; the troubles in Northern Ireland). Such accounts ignore historical and cultural contexts and so often do not help us understand the events.

Schools could promote a better understanding of the world and of our societies. For instance, the history of the Jewish people and certain episodes from the Bible as well as the fact that Jerusalem has been a holy city for Muslims for centuries would shed light on some of the religious issues in the Israel-Palestinian conflict. If students were given details about the differences between Sunnites and Shiites, they would then perhaps better appreciate the complexity of the Muslim world today, which is far from unitary. If the religious history of the United States of America were explained, we could better understand certain ways of American thinking.

Teaching About Religion in Secondary Programmes

Aspects of teaching about religion are present in the French secondary school curriculum, mainly within history, but also in literature and philosophy. The aims of history programmes are

- intellectual: to contribute to the way we learn;
- civic: to help develop citizenship by encouraging knowledge and understanding of the contemporary world;
- in terms of heritage and culture: to build upon a heritage which the present population will inherit, and also by the same token to enable them to belong to a culture.

In lower secondary school, apart Egyptian and Greek mythologies, the programme includes the Hebrews as a people from the Bible, as well as the origins of Christianity. Links with the French-language programme are reinforced through the study of fundamental texts (the *Odyssey*, the Old and New Testaments, the *Aeneid*). Other studies include: Orthodox Christianity; the Muslim world; mediaeval Western Christendom (including the role of the Church); the Protestant and Catholic reforms; divisions between Catholics and Protestants in Christian Europe; the Age of Enlightenment; and the laicisation of societies.

These are not new topics as they already existed in earlier programmes. They are now accompanied by recommendations which insist on the need to take into consideration the historical dimension of Jewish and Christian religions, and to study heritage documents, both literary (such as the Bible or the works of Homer), and architectural (such as cathedrals or mosques), or artistic (such as paintings). Further, it is stressed that these are not merely illustrations, but rather integral parts of the programme (Estivalèzes, 2005a, p. 108).

At upper secondary school, where one of the aims of teaching history is urban integration, the programme for 15- to 16-year olds is devoted to the study of six historical moments marking the development of contemporary civilization, which we have inherited, including: the origins and spread of Christianity; the Mediterranean in the twelfth century; the crossroads of three civilizations (Western Christendom, the Byzantine Empire and Islam). This latter topic has the political aim of showing that 'far from developing in isolation, a civilization is enriched by its confrontations and exchanges with other civilizations' (Dahéron, 2004). This section of the programme includes also the topics of Humanism and the Renaissance, with the influence of the Reforms. The next two years' curriculum, devoted to contemporary history, places more emphasis on the economic and social aspects rather than the religious dimension of history. Figures from religious life in Europe and North America, and the relations between Churches and the modern worlds from the middle of the nineteenth century to 1939 are explored, as is the development of beliefs in France since 1945.

Examination of these programmes suggests several comments. Firstly, it can be seen that the contexts—ancient or mediaeval—in which religions developed

are given more weight and that religions are strangely absent from contemporary history. This is particularly harmful to Judaism, reduced to the history of the Hebrews, and to Islam, limited to its first centuries. Is the intention here to think of religions (only) when linked to societies of the past? The risk would be to project a model of a highly-secularised Western society onto the rest of humanity. Secondly, the religions studied in programmes and therefore presented in school textbooks are principally those known as ‘monotheistic’. Although this is understandable at a historical level, given their importance in our past, it is highly regrettable that no mention is made of Asian religious systems—Hinduism, Buddhism or other spiritualities. The inclusion of these traditions is important for students from Asia, even if they are in the minority in France. Some currents of these spiritual traditions exert, such as Tibetan Buddhism, also fascinate some young people. Moreover, these religions play a very important role in many societies.

As regards the literature programmes, the main innovation is the explicit reference teaching about religion through an introduction to the Bible as one of the fundamental texts. These texts also include such works as the Homer’s *Odyssey* the Virgil’s *Aeneid* or Ovid’s *Metamorphoses*, whose aim is to raise awareness of ‘the cultural sources of ancient heritage’, both Judeo-Christian and Greco-Latin – this being the main innovation. Implicitly, the literature programmes enable much interaction with religious fact. A significant portion of French literature is impregnated with religious references, for example, Ronsard, Agrippa d’Aubigne, Pascal, Racine, the philosophers of the Age of Enlightenment such as Voltaire, as well as the works of Nerval, Baudelaire or Mallarmé.

In philosophy, several notions such as ‘religion’, ‘truth’, ‘belief’ and ‘knowledge’ may intersect with religious issues. In the list of authors for study, there are St Augustine, Averroes and St Thomas Aquinas, as well as Descartes, Pascal, Spinoza and others.

In this brief overview, it can be seen that teaching about religion is far from absent in secondary education programmes and that there is the will to discuss religious issues seriously, with respect for laicity. This requires appropriate training of teachers.

Training of Teachers

If we are to consider the decision that was taken in France not to resort to specialists in the history of religions, but to make use of teachers in the subject areas concerned, i.e. mainly those of history, literature and philosophy, then in our opinion one of the most important issues is that of teacher training. How is the subject of religions best approached as a subject of study within the context of the curriculum? With what tools? Is such training best provided during an initial training course, for example at university? Or, in the case of serving teachers, are there training courses on religions that would enable them to update their knowledge?

The national survey that we carried out on this subject provides precise answers to such questions (Estivalèzes, 2005a). Without going into detail, it can be said,

as far as the initial training of students at university is concerned, that for many future teachers it is possible, in some universities, to take courses in the history of religions for historians (although this is always offered as an option). They can also explore the history of religions and the anthropological approach to religion. The list of religions studied includes Judaism, Christianity, Islam and Buddhism. Equally, it is possible, in some literary specialities, to take courses either on biblical texts (extracts from the Old or New Testaments) or the literary inheritance of the Bible—but again, always as an option.

Students take these courses for a wide variety of reasons (Estivalèzes, 2005a, p. 175). It may be an interest in the cultural aspect of a subject about which they know little, or an anthropological interest in understanding humankind and its relationship with the sacred. Sometimes it may also be for personal reasons—some choose such courses to know and understand their own faith better because they are believers.

What is obvious is that all courses on religions are optional, and students may freely decide to take them. This means that students take them because they want to, on an optional, voluntary basis. Furthermore, the availability of these courses on religions at French universities is intrinsically linked to the academic proficiency of the teachers. These courses only exist because the teaching staff are both qualified and willing to undertake such courses. More generally, there is also the question of the place of the history of religions or religious studies and their recognition in the French university landscape, which until now was not very important.

For training active teachers there exist a certain number of initiatives:

- national or regional training sessions, sometimes lasting several years, for teachers in the public system;
- theme-oriented summer universities on teaching about the origins of Christianity, Judaism, Islam, Buddhism, Protestantism, but also on laicity and the sociology of religion;
- and for teachers in the private system (which has the same curriculum as the public system, but has the possibility of providing religious activities) national sessions on the three monotheisms, on religion and literature, Christianity and modernity, etc.

However, once again, the decision to participate in these training courses requires a personal commitment by the teachers themselves.

This concern for ongoing training is also evident in the publication of a certain number of teaching manuals, such as the series 'History of religions' created in 1989 by the regional educational centre of Franche-Comté. It was specifically designed for teachers and contains syntheses of university knowledge, documents, as well as suggestions for teaching practice. Other publications include works on the origins of Christianity, Protestantism, Islam, the first religions of humanity, religions in the contemporary world, laicity and a volume on the scriptures of the major religions (for example, Ferjani, 1996; Lévêque & L'Huiller, 1992; Nouailhat, 1990).

Beyond the issue of teacher training, there are some theoretical and practical difficulties inherent in the teaching the history of religions (Estivalèzes, 2005a). It is not always easy to talk about religions with students since religions involve the field of the symbolic and the complex with which they are unfamiliar. Furthermore, talking about religions touches upon personal, private convictions. But a teacher is obliged, within the framework of the lay school system, to respect the freedom of conscience of students and to refrain from sharing their own religious or philosophical convictions. They should also try to create conditions for dialogue with and between students, and help them to attain a level of mutual tolerance. This type of approach is not necessarily easy for everyone. It requires personal reflection on one's own positions and of the rules of conduct by teaching staff.

What sometimes occurs when the subject of religions is broached is a sort of general unease. In their daily school activities, some teachers, if they are believers, are apprehensive about dealing with religious issues in their syllabus for fear of not being able to separate their personal convictions from the academic approach they are obliged to adopt. They practise a type of self-censorship for fear of not being able to respect the idea of laicity irrespective of all religions. Those most likely to be at ease in such a situation would be teachers who are non-believers.

The experiences and reports from teachers (Estivalèzes, 2005a) show that it is often easier to talk about the religious systems of Antiquity, e.g. Egyptian, Greek or Roman, as they belong to societies of the past and do not raise the same problems as contemporary religions. There are two dangers here: that of relegating religions to museums; and even that of trivialising religions and making them things of the past.

Yet it is important to present the religions of Antiquity, not only as a set of divine figures and myths, but also as systems with meaning for their contemporaries. It is clear, even when dealing with living religions, to the extent to which they are presented in history textbooks as tied to their roots, a justifiable position from a historical viewpoint. But they are often stuck in an idealised past, sometimes to the detriment of their recent past.

If these questions are not easily dealt with by teachers, then the same will be true of the students. Much has been said about the absence of religious culture in young people, but another type of problem sometimes presents itself: that of children who believe in a particular faith, who have a strong sense of identity and a need to express their convictions (but often with little or incorrect information about their religion). This sometimes gives rise to the situation where students call into question the right of a teacher to talk about a religion that they do not themselves support. Some information activities are needed in such situations. Teachers (and pupils) need to reflect firstly, on the principle that talking about religions may not be limited to those who believe in them; secondly, on the type of historical or literary approach best-suited to the classroom discussion about sources, beliefs, rites, texts and values advocated by such and such a religious system; and finally on the values of the lay school system which are common to all students and provide the space for non-religious debate on religions. However, the academic approach tends to limit itself to certain aspects of the religious experience that are analysed

with the help of appropriate methodological tools. If we are to respect the freedom of conscience of all, then the convictions of some should not be imposed on all others.

The principal and best solution to all of these difficulties is a requirement for disciplined academic thinking on religions. This can only happen if teachers are properly trained either by means of the courses offered or, and inevitably, by means of self training and learning consisting of reading and individual work. The Debray report (2002a) is evidence of the political awareness of how important adequate teacher training is. However, it remains uncertain whether politicians will actually take decisive steps to encourage the teaching about religions in schools.

Conclusion

In relation to the study of religions in schools, France is unique in the West. No class is entirely devoted to religions, in comparison with other European countries where there are widespread differences in practices from one country to the next (Willaime & Mathieu, 2005). This is itself deeply linked to the way relations between the State and the Church are conducted. Thus, in Germany, confessional courses on religion exist in theory, but the reality is more complex since the situation changes from one region to another. In Spain or Italy, religious classes are optional and Belgium offers classes on morality for those students who do not want to take confessional courses. England, Wales and Scotland have a multicultural religious education in their fully state-funded schools, and Denmark offers lessons on history of religions for older pupils. What can also be seen is that, although countries have different models, most of them are seeking new alternatives, partly as a result of the growing number of requests for exemption by students, but also in order to meet new cultural and civic needs, in particular in plural and secular societies, such as those mentioned above (but not limited to France).

Although it is neither possible nor desirable to envisage a common model, due to the individual characteristics of each country in relation to their history and to the types of relationships between State and Church (Davie & Hervieu-Léger, 1996; Willaime, 2004), and particularly between religions and educational systems, it is however interesting to compare thinking on the place of religions in schools in each country (Borne, 2004; Willaime & Mathieu, 2005), as well as the results of current pilot projects with their positive points and difficulties. The social debate in France on teaching about religion could contribute to this shared European review process which hopefully will enrich the debate among members of the European Community and beyond.

THE CONTRIBUTION OF HINDUISM AND HINDU-INSPIRED SPIRITUALITY TO AUSTRALIAN RELIGIOUS AND VALUES EDUCATION

Terence Lovat

University of Newcastle, Australia

Introduction

One of the more rapidly growing religions in Australia during the period since the 1971 national census is Hinduism, boosted especially by an increasing pattern of immigration from India and Sri Lanka (Department of Immigration and Multi-cultural and Indigenous Affairs [DIMIA] 2004a, 2004b). This chapter draws on documentary and empirical work conducted with Hindu and Hindu-inspired communities during the 1990s and the early part of this century, work which was initially designed to elicit greater understanding of the Hindu perspective on emerging school curricula around religious and values education. The focus later expanded beyond concerns of school curricula to capture broader understandings of the nature of Hinduism and Hindu-inspired spirituality and the potential contribution of such spirituality in an increasingly multi-cultural and multi-faith society. It also explored the specific topic of Hinduism and Hindu-inspired spirituality as agencies of inter-faith movement, change and conversion. The work was located in the first instance among the regular adherents of one of the two largest orthodox Hindu Temples in Australia, the Sri Venkateswara Temple in Sydney. Later work expanded to take in those more broadly Hindu-inspired groups that tend to gather around such sites from time to time and the main focus among these latter groups was the Brahma Kumaris.

Australia's Religious Heritage and the Increasing Hindu Presence

Australia's multi-cultural population is religiously diverse but the foundational spirituality of Australia belongs to its indigenous inhabitants, the Aboriginal and Torres Strait Islander peoples. The Australian Aborigines and Torres Strait Islanders,

the 'first-comers' (Stockton, 1995) to this land, came approximately 40,000–60,000 years ago, migrating from Asia and Melanesia. Over the course of the following millennia, they developed a strong spiritual bond with the land, a bond which powerfully characterised their beliefs and ritual systems. The relationship between the people and their land was mythologised and ritualised into a religious system that was highly integrated, cohesive and complex (Stockton, 1995), but one which nevertheless varied according to geographical location (Swain, 1991). Indeed, Aboriginal land spirituality is one of the richest to be found anywhere in the anthropology of ancient peoples and, despite the variability of beliefs across regions, there was in place a shared world-view and common set of religious beliefs and practices. The most central of these beliefs was that concerned with the spiritual power of the land (Tonkinson, 1991). This central belief connoted animism where the land and other natural phenomena possess living spirits, and these spirits are perceived as having influence over day to day life.

Of all the major religions imported into the country in the past two hundred years, Hinduism may well be the one which best fits with the indigenous spirituality of Australia, and hence the one that is most suited to the same physical environment. Like Australia's indigenous spirituality, Hinduism is a religion that emphasises the immanence, rather than transcendence, of the spiritual world. This is an immanence that draws the world of the gods and that of the day to day into an integral relationship. There is no separation between religion and life, in the form that has characterised so much of the history of Christianity. In turn, for both Australian indigenous spirituality and Hinduism, the physical world is sacralised in both its animate and inanimate forms. The elements of nature are to be revered, if not worshipped in some cases, and to be brought into a relationship with the believer. For Christianity, by contrast, the dominant theology about the physical environment has been around its rightful subjugation by humankind. Hindu spirituality strikes a deep chord with a set of spiritual traditions that were active in the Australian continent at the same time that the precursors to Hinduism were forming on the Indian sub-continent.

The early history of Hinduism in Australia is tied to extensive travel undertaken by sub-continent Indians in the late eighteenth century (Bilimoria, 1989). Here, we understand the word 'Indian' to denote people who originated from lands that today would include India, Pakistan, Bangladesh and Sri Lanka. It is not therefore a racial term as much as one that identifies a large and diverse ethnicity with common ancestral, cultural and linguistic roots. While stories abound that Indian traders may have come to the continent in the Middle Ages, the first concrete evidence relates to an Indian presence in the so-called 'First Fleet', those English incursions to the continent in the last decade of the eighteenth century and the first two decades of the nineteenth century (Clark, 1987). It was during this time that Australia was colonised and settlers from the British Isles began to form a Western nation in a very non-Western environment. The Indians arriving as part of the First Fleet were members of ship crews. Subsequent Indian travellers came to Australia as imported workers, filling various roles such as labourers in plantations (primarily in the state

of Queensland), as well as working as domestic servants, shepherds and farmhands, camel-drivers, hawkers and pedlars who travelled to remote communities (Christian Research Association [CRA], 2001).

By the 1857 census for the colony of Victoria, 277 Indian or 'Hindoo' people were recorded among its population. There were also a number of Sikhs and Muslims identified in the same census, though they were in smaller numbers than the 'Hindoos' (Bilimoria & Ganguly-Scrasse, 1988). The number of Indians (including Hindus, Muslims, Sikhs and Afghans) in Australia grew steadily from 1857. Two thousand such inhabitants were recorded in the 1871 'national' census, three thousand by 1880 and four thousand five hundred by the first census (1901) of the new federated nation (Bilimoria, 1996). The extent of this South Asian population was sufficient to unnerve many white Australians and the first signs of a public backlash can be traced to the 1890s. By the time of Federation, growing public unrest about the number of non-European immigrants in Australia resulted in a government response which took the form of the Immigration Restriction Act 1901, otherwise known as the 'White Australia Policy'. The policy had a heavy impact on non-European immigration, with immigration from Asia virtually ceasing for the next 60 years (CRA, 2001; DIMIA, 2004c).

The range of policies associated with the general 'White Australia' approach created severe limitations not only on immigration patterns but also on conditions for non-white Australians living in the country already. For example, there were restrictions on the employment of 'coolies', the renewal of licenses for pedlars became increasingly difficult to obtain and it became virtually impossible for a non-white to gain a leasehold over land (Bilimoria, 1996). Under these restricted conditions, it was difficult for Indians of any religious affiliation to build a comfortable life, or to do little more than merely survive. In these conditions, it was unlikely that a strong, cohesive Hindu community would develop and the evidence is that there was little sense of a communal ethnic or religious identity for the diaspora Hindus of this period (Bilimoria). Ultimately, the White Australia Policy was effective in reducing the number of Indians living in Australia or seeking to come here. After the Policy's repeal in 1967, immigration from the 'Indian' lands began to grow again.

It is via the immigration of the 40 years or so since the repeal of the White Australia Policy, marked by huge waves of transportation from Asia and the Middle East, that the profile of Australia's religious affiliations has been re-shaped so radically (Australian Bureau of Statistics [ABS], 2003). It is as a result of these waves of immigration that Australia has become one of the world's most multicultural societies characterised by a rich religious difference (Bouma, 1995). The Australian Hindu population is an important element in that richness and diversity. Of the approximately half million new arrivals to Australia between 1996 and 2001, five per cent nominated Hinduism as their religious affiliation (ABS). In the 1986 census, there were 67,300 people who affiliated with Hinduism living in Australia; this was 0.4 per cent of the Australian population. By the 2001 census, there were 95,500 Hindus living here, representing 0.5 per cent of the population (ABS). This

growth represented a proportional increase in a fifteen year period of 42 per cent, one of the largest proportional increases in religious growth for any religion evident in the 2001 census data (ABS).

The heavy immigration of Hindus to Australia has not only been impelled by Australia's stronger embrace of Asian immigration in the past 40 years, but also by particular world events. This has been especially the case where the Hindu diaspora is concerned. For example, the number of Indian arrivals from Fiji expanded hugely in response to Fijian political unrest throughout the 1980s (DIMIA, 2004d; Hughes, 1997). Similarly, political unrest in both Sri Lanka and parts of Africa has increased the numbers of people from those Hindu diaspora communities who have migrated to Australia. The result is that the more recent arrivals in Australia have diversified the local Hindu population beyond that which existed in earlier times. In 2001, there were approximately 31,920 Hindus of Indian descent (DIMIA, 2004a), with another 19,770 of Fijian descent (DIMIA, 2004d), 10,210 Sri-Lankan born Hindus (DIMIA, 2004b) and, although constituting a very small percentage of the Hindu population, there were also 390 Mauritius-born Hindus living in Australia at this time (DIMIA, 2004e).

Importantly for the research at hand, Bilimoria (1989) identifies two aspects of Hindu influence in the period in question. One concerns the actual population growth caused by masses of Hindu people coming to live in the country, while the other is related to a growing preoccupation in the broader Australian population with universalist spiritualities such as theosophy, transcendental meditation, divine light, Hare Krishna, and various groups oriented around the practice of yoga. This latter grouping includes the Brahma Kumaris. Bilimoria's two levels of Hindu influence are interrelated, with the presence of Hindu Temple worshipping communities providing a point of focus and affirmation for broader forms of Hindu-inspired activity.

Research in the Relevant Communities: (i) Mainstream Hinduism

Ethnographic research with the Sydney Hindu community was conducted throughout the early 1990s. This consisted of regular visits to the Sri Venkateswara Temple in Sydney's southern suburbs. This is one of only two major and complete Hindu temples in Australia, the other one being located in Melbourne (CRA, 2001). Both of the temples tend to be dominated by the minority Sri Lankan Hindus, in conjunction with Tamils and Telugu speaking Hindus who originate from southern India and Malaysia (CRA). The results of this aspect of the work have largely been recorded already in a number of works (Lovat, 1995a; 1995b; 1997a).

The ethnography was based on weekend visits to the Temple, including participation in Temple activities, casual conversations, more formal interviews and a 'paper survey' which was made available in the Temple precincts and which, when completed, was left with the local priests for collection or sent directly to the researcher. While many aspects of Hinduism were aired during these encounters, the major topic of concern centred on the attitudes of the community to new ventures in

religious and values education being trialled in New South Wales public curricula. The research was part of broader research which was reaching out to all the major forms of non-Jewish and non-Christian religions in order to understand better the levels of support and/or concern which existed around the development of these new curricula.

Two common themes emerged from the ethnography. First, there was a general consensus among participants that a religious education that involved comparative religious studies and values was not only useful, but actually part of the Hindu quest. Second was the issue about who was qualified to teach about the religious and values dimensions of Hinduism.

To the first of these: it was generally accepted that it was valuable to have a curriculum in place that promoted religious awareness. A common theme was that 'to be religious is to be Hindu' (Lovat, 1995a, p. 174). Thus, Hinduism's inter-religious nature was seen by the adherents generally as being readily accommodating of other religions. The following comments by the participants represent this view:

'To the Hindu, all religions are ultimately the same.'

'By knowing about other religions ...[students] will learn that all religions are but different paths to the same goal. Through this, they will realise that all people and races are inter-related. It is hoped that conflicts between various groups on the basis of religion will cease to exist.'

'[It's exciting for] everyone to learn something about everyone else ...this is very Hindu in fact!'

'...by learning about other religions, children can come to appreciate their own religion better' (Lovat, 1995a, p. 173).

For most participants, education that took a broad-based approach to religious literacy was to be embraced, particularly given the view that there were few mechanisms in Australia that provided the general population with knowledge about Hinduism. Furthermore, because the religious schools of Australia were perceived as failing to achieve a broad approach in their favouring of an evangelical approach to religious education, some participants viewed it as particularly important that public sector schools take up the broader responsibility (Lovat, 1995b).

To the second issue: there was frequent comment concerning the capacity of a non-Hindu to teach about Hinduism (Lovat, 1997a). For the most part, participants, including priests and those with theological knowledge, expressed the view that anyone who had sensitivity for the subject could teach others about Hinduism. This attitude fits well with Hinduism's broad tolerance for the notion that there are multiple paths to the same end. No participant in this aspect of the research believed that having a Hindu teacher was essential to religious education about Hinduism, though some did differentiate between education 'about' and education 'in' a religious tradition (Lovat, 2002a; Rossiter, 1981), even if they did not use this language for the differentiation. For these latter participants, the deeper search for religious growth implied by 'education in' would require that a guru, rather than the mere teacher, be involved. They did not regard this as part of the school's

responsibility but they could see that a broadly based and highly informative religious education could play a part in laying the foundation for such 'education in', otherwise known as religious induction or enfaithing, if the induction was into a particular tradition. At this point, most suggested that induction into the spiritual depths of Hinduism would require mentoring from a Hindu guru.

There were a small number of participants who articulated views quite different from those reported above; the first one was a firm view about the need for change in Hinduism. This view was associated with scepticism about Hinduism being in fact as tolerant and beneficent as was its surface claim. One participant cynically described Hinduism as a meaningless superstition used by the upper castes for political power and their own interests. As a consequence, it was argued that there was little hope for change in the religion because the religious establishment had too much to lose. Another participant reasoned that, as the younger generation of Hindus inter-married with Australians, the old Hindu religion would meet its demise, or at least change, as more and more Hindus came into contact with Australian religious people who tended to be more active in seeking change in their religion and religious structures. The dominant view here, shared by a number of participants, was that the real value of a broad based religious education was that it would encourage students, including young Hindu students, to question their own religion. This minority believed this would have long term beneficial effects for the Australian Hindu community (Lovat, 1995a).

Another participant argued that many of the traditions of Hinduism were a result of cultural traditions, rather than religious dogma, and that most Hindus did not know this. While he was less cynical about the contemporary role of Hinduism than some of those cited above, he nonetheless identified much that could be changed, and he saw that education generally and religious education in particular would play a key role in such change. He saw the potential of education about Hinduism to benefit the religion by highlighting certain areas where change was needed. As an example of a potential beneficial change, he offered the issue of gender inequality, suggesting there is no basis for it in the theology of Hinduism and a good religious education would uncover its true basis as mere outdated chauvinism. He saw an education that promoted religious awareness as an opportunity for greater numbers of Hindus to understand better their own traditions, as well as providing the opportunity for them to explore other religious worlds (Lovat, 1995a).

The Hindu participants also endorsed without question the importance of the role of schools in teaching about and inculcating personal and social values. That is, participants frequently drew a distinction between religious values and cultural ones. On the one hand, religious values were perceived as relating to matters of the soul, whereas cultural values were associated more with material concerns, such as developing one's place in society. For the Hindu, religious values were characterised as providing the fundamental mores to which all other values were tied; indeed, other values were seen to be meaningless without a religious basis (Lovat, 1995a; 1995b).

Research in the Relevant Communities: (ii) Brahma Kumaris

The Brahma Kumaris (BK) are a religious sect originating from within a broad Hindu culture. The BK seek personal enlightenment through meditation (raja yoga), chastity, communal living and vegetarianism (Lovat & Morrison, 2000). The BK have grown into an international organisation with a strong egalitarian reputation and they hold a special international status that is rare for a sect of this kind. For example, since 1980, the Brahma Kumaris World Spiritual University has been affiliated with the United Nations as a Non-Government Organisation with general consultative status with UNESCO and UNICEF. The BK have sponsored regular congresses and 'international dialogues' with world leaders, chiefs of industry, academics, the media and religious groups, around issues associated with world peace. In addition, UNESCO has co-sponsored BK publications and programs of learning, providing it with the status of being a major coordinator of international dialogue (Whaling, 1995).

The BK participants in the research were all individuals who visited the various BK centres across Australia, with many gravitating to the Hindu Temple on occasions, especially around major festivals like that of Ganesha (Lovat, 1997b). It was at one such festival that contact was first made with the BK thanks to their completing the paper survey available in the Temple precincts. This was followed up with many encounters with BK across Australia and worldwide, including through an international dialogue at the World Spiritual University in Rajasthan, India. These more profound encounters led to more intense understanding of a range of issues associated with the inspiration of BK and, indeed, with its basis in Hinduism (Lovat & Morrison, 2000). Unlike the data above, the data below are published in this chapter for the first time.

When asked generally about what they would change in the school curriculum or add to it, the BK participants invariably focussed on issues of education about and in religion. Comments such as those below were typical:

'In a secular school system located in a materialistic society, I'd like to see all kids exposed to comparative religions....'

'...classes should certainly delve into the beliefs of all the religions of mankind [sic] through the ages, but be primarily concerned with spirituality....'

'Perhaps more study of a wide range of religions with the intention to find common ground....'

'For me, I think it would be helpful to not only focus on various religions and their beliefs but also to know how to create a spiritual experience....'

Similar views were also found in the comments made by the BK participants around issues of values education. On this issue, however, there was greater sensitivity to a number of distinctions to be made. On the one hand, all participants readily proposed that values needed to be part of the school curriculum but a number drew the important distinction between religious values and moral or cultural values. One participant argued for the need for 'moral values based training, not religious

studies' while another participant expressed the view that mystical or esoteric knowledge should not be taught in schools, because such knowledge should be for those genuinely searching for truth. The implication here was that mystical knowledge was inappropriate for the general school curriculum. As this person put it, 'When the student is ready, a master appears'. On the other hand, in general the BK participants expressed a view that more values based education was a good thing, with comments like the following being typical:

'More of values education....'

'Add values as an entire topic.'

'Teaching children throughout their schooling and at university about values in an interesting and spiritually empowering way would have a great effect on society, the home, human relations, etc.'

'...more time should be given to teaching values.'

'We need to incorporate values based education in all subjects....'

One clear difference between the views of the Sydney Hindu worshippers and the BK was that while the BK did indicate a similar valuing of the introduction of a study of comparative religion into the school curriculum, many BK also called for the inclusion of programmes that focussed on the development of students' confidence, skills and knowledge related to self-esteem, the exploration of one's self, and meditation. This valuing of 'self' and meditation is not surprising given that one of the primary values of the BK belief system is self-realisation through meditation. The BK participants also showed a tendency to link the development of self-esteem and the process of learning about oneself with a placing of oneself within a world community or world family. In the comments that follow, the BK participants illustrated their concern for self-esteem, meditation and the notion of the one world family:

'The highest priority should always be personal self esteem and seeing oneself in the context of a world family....'

'[Schools should] teach people about their inner selves—who they are; that we are all brothers [sic]; that the world belongs to everyone.'

'[Schools should provide] basic skills on self respect.'

'A study of philosophy to promote cognition and lead students on a path to self questioning and development. This I would have permeate all other specific subject areas to cross fertilise, stimulate and challenge.'

'[Schools should provide] training in positive thinking, self-reflection or meditation.'

'I see so much pressure, stress and worry on kids today that meditation is a very good tool in supporting them all.'

There were two additional concerns of the BK participants that were not raised by the Sydney Hindu worshippers. First, was a minority concern to include what could be classified as 'life skills' in the curriculum. Participants suggested that their own

schooling lacked education about how to succeed in life in very practical ways, such as knowing how a bank operated, a local council functioned, issues around child-rearing, and other such practicalities. Other related suggestions included recommendations to include training in conflict resolution, reflective listening and relationship skills. Second was a concern that schools focussed altogether on the 'wrong' type of knowledge or outcomes. One participant stated that '...secondary curriculum seems to have lost the value to 'basic' teaching in favour of output in quantity and academic cleverness.' Another suggested that '...the curriculum needs to be simplified—there are too many useless subjects and more time [should] be given to teaching values.'

*The Contribution of Hinduism and Hindu-inspired Spirituality
to the Concerns of Religious and Values Education*

In terms of its contribution to religious understanding in a multi-faith society, and the religious education thereof, Hinduism has much to offer to the average Australian. It is a very different religion from those most familiar to the dominant population. It might properly be described as 'sensuous', expressing a profound understanding of the countless dimensions of the phenomenon we know as 'God'. God truly is everywhere and in many different forms, with a manifestation for virtually every moment in life. This allows an ease of access to the spiritual by the Hindu. In this respect, it is reminiscent of the indigenous spirituality on which all Australian spirituality ultimately rests, and Hinduism may be seen as a genuinely better fit with this core aspect of Australian spirituality than are Judaism and Christianity. In this respect, Hinduism has much to offer to a religious education that is concerned to delve into the distinctive character of Australian spirituality.

Similarly, it has been through the influence and concerns of new religious groups, like the Hindus and their affiliated groups, that Australia's public school system is moving away from its characteristic secularism towards embracing the notion that the inculcation of both religious and values education is part and parcel of its charter before society (Lovat, 2001; 2002a; Lovat & Schofield, 1998; 2004). Indeed, most especially around values education, the BK have been one of the more powerful influences in Australia (as elsewhere) in the design, development and implementation of a program that currently operates in 80 or so international settings. This is through their very explicit support of the UNESCO-affiliated *Living Values in Education* (Living Values Educational Programme, 2001). The group has been instrumental in supporting Australian public and private school systems in trialling and experimenting with this internationally sensitive and comprehensive values education programme.

Especially for those who conceive of religious and values education as being ultimately about 'education in', or personal induction into the worlds of religion and values, Hinduism and Hindu-related spirituality would seem to have much to offer. The testimony is that many are profoundly influenced when they encounter this form of spirituality. Beyond the large number of movements, like the BK, that

have found such a strong home in Western provinces, there is a range of specific testimony, related both to eminent characters and to ordinary folk who have been profoundly influenced in their religious and values stance through their encounters with Hindu spirituality.

For instance, Dietrich Bonhoeffer, the Second World War martyr, engaged with Hinduism and one of its many offshoots, Jainism, largely through his active dialogue with Gandhi. Bethge (1970) offers testimony that Bonhoeffer's interest in India and its spiritualities was an abiding and tantalising passion for him: that he had a keen sense that Christianity had originally come from the East and that it was only through the East that it could ultimately be understood. Bethge cites him as saying of Indian spiritualities that: 'Sometimes, it even seems to me that there's more Christianity in their 'paganism' than in the whole of the Reich Church' (p. 330). It was through his study of and reflection on Hindu spirituality that Bonhoeffer developed his profound pacifism (Lovat, 2003).

Similarly, Dom Bede Griffiths, who became, at one and the same time, Benedictine monk and Hindu holy man. As a fully professed monk and Catholic priest, he went to India, initially as a missionary, only to be converted, in a sense, by the profoundly spiritual world of Hinduism. Over time, he put the two spiritualities together, not so much formally as in and through himself. Towards the end of his life, he claimed to have come to renewed knowledge of God through his Hindu journey and, through this, to have come to know and understand himself for the first time. Like Bonhoeffer, Griffiths was changed, becoming a living enshrinement of reinvigorated understanding between two apparently very different religious traditions. In the words of Fox (1996), he had become a 'post-denominational priest', at one and the same time a Hindu monk and a Christian sannyasi (Lovat, 2003).

As seen in so many of the BK participants in this research, Hindu-inspired spirituality can play a particular part in facilitating people's search for renewed spiritual growth. It tends to provide safe haven, especially for those wearied of the strictures of the 'High God' and invariably authoritarian religions (Lovat & Morrison, 2000). In a particular species of cross-religion research, some of the commonalities between Judaism and Hinduism were explored in both theoretical terms (cf. Chatterjee, 1994; Goodman, 1994; Holdrege, 1996) and in empirical terms through case studies of two women reared as orthodox Jews but who had converted to BK (Lovat, 2003).

One of the women described above began by saying that she could not believe she was meeting someone who was doing research in an area about which she had been having such strong feelings. Her work in Israel had convinced her of a deep synergy between Judaism and the Hindu-based spiritualities. She volunteered much that reflected directly on the theoretical work cited above, namely about the common family, home and ritual eating aspects of the two traditions, and that behind the *prima facie* differences of monotheism versus polytheism, there was actually a common conception of a singular godhead (Lovat, 2003).

It was noted as relevant that BK had taken off with amazing speed in Israel, in spite of a fair amount of cultural resistance to religious movements that take people

away from Judaism. In spite of this, the attraction of BK had been remarkable throughout the entire country, with most converts identifying the ease with which the transition of spiritualities could be made. She spoke of her own experiences of feeling at times in Israel that she was in fact in India, so familiar was the look and feel of the environment and the spirituality. She said she had at times felt the converse while in India (Lovat, 2003).

The other woman confirmed that, even from the perspective of her Orthodox Jewish background, she felt a natural progression from the God of her upbringing to the God held to be central by BK. Moreover, she confirmed the sense of closeness between the two traditions, from her point of view, suggesting that she had even seen aspects of fairly explicit Hindu theology growing anew in Judaism. She provided the example of a renewed belief in Karma which she saw growing in Judaism, especially in relation to issues of violence and warfare and the reviewing of traditional beliefs related to God's will (Lovat, 2003).

Both women suggested strongly that the religious paths they had been placed on initially in Judaism had been confirmed and enhanced by their exposure and movement to a Hindu spirituality. They both, at times, made strong statements about coming to know themselves for the first time, about self-discovery and change of the sort reminiscent of the experiences of Griffiths in his cross-religious journey. One of the women said that, in many ways, she had found in BK what she felt Judaism had been attempting to teach her all her life. Beyond that, she felt that she now understood the religion of her childhood better than ever because of her penetration of Hindu spirituality (Lovat, 2003).

Like Bonhoeffer and Griffiths before them, having come to understand themselves anew through engagement with a far bigger world than they had grown up with, neither woman could remain where she had previously been. She had to change her life position in some way. This would seem to be at the heart of religious education as induction. Not that it necessitates conversion from one religious tradition to another, but that it will of necessity challenge the religion of one's childhood and raise the possibility of movement of some sort, perhaps to more profound understanding of one's own faith or perhaps to separation of some sort. The testimony of the women in question was, ironically, that both may be achieved in the one movement.

Conclusion

It would seem, therefore, that Hinduism and Hindu-inspired spirituality have much to offer to an Australian religious education that is expanding its charter from narrow enfaithing regimes to that of cross-cultural religious literacy. Assuming that one is interested to explore and understand ever more one's own faith and culture, the study of Hinduism offers much in the way of new knowledge and understanding, not only about Hinduism but, by reflection, about one's own faith tradition. This would seem to have been the experience of Bonhoeffer, Griffiths and the women in the case studies. Furthermore, as suggested already, it would seem that Hinduism

might have a particular synergy with the core indigenous spirituality of Australia, and this might be explored further in ongoing research

In the light of this clear potential for cross-cultural enrichment through the right forms of education, let my last words be about the need in our time for robust and bold forms of religious and values education (Lovat, 2002b). Granted the issues that face the world today, we need forms of religious and values education that are dedicated to making a difference in the way people understand each other and function together in the human community. We need a religious and values education whose charter is unapologetically one of generating peace, goodwill and cooperation among peoples. We need a religious and values education that impels the kind of self-reflection that instills induction into new ways of thinking and acting, both religiously and in terms of the values we hold and espouse. For Australian religious and values education, Hinduism and Hindu-inspired spirituality are playing their part in facilitating this kind of religious and values education, be it by the richness that their religious instances provide to the curriculum, by the power of these spiritualities to challenge and impel change in a student's thinking and life-positioning, or by the direct impact that the followers of these spiritualities are having on the development of religious and values education curricula.

ISLAMIC NURTURE AND IDENTITY MANAGEMENT: THE LIFEWORLD OF MUSLIM CHILDREN AND YOUNG PEOPLE IN NORWAY

Sissel Ostberg

Faculty of Education, Oslo University College, Norway

Introduction

The focus of this chapter will be on the role of Islam in the lives of Norwegian Pakistani children and young people, with regard to identity management in a secular and plural context. The discussion will, however, incorporate a discussion of education and socialisation and thereby also be related to the role of religious education as a part of secular schooling.

In 2005 the immigrant population in Norway numbered 364,981, i.e. 8% of the total population (Statistics Norway, 2005). The Pakistanis formed the largest group within the immigrant population: 26,950 (of which 15,154 were first-generation immigrants, while 11,796 were persons born in Norway of Pakistani parents). The Pakistani immigration to Norway started at the end of the 1960s and was a typical labour seeking chain immigration, similar in character to that of the immigration of Pakistanis to Britain (Anwar, 1996). The first empirical research on which this chapter is based was conducted from 1994 to 1998 (Østberg, 2003a). The second research was a follow-up study of the first and was conducted from 1999 to 2002 (Østberg, 2003b; 2003c). Five Pakistani families in Oslo with varied socio-economic and cultural backgrounds were followed closely throughout a ten year period. Participant observation and formal and informal interviews were the key methods used. The sample consisted of sixteen children and young people within these five families, supplemented by more children, young people and grown-ups who were part of their life-worlds at school, in the mosques and at leisure activities.

The next section will clarify the concept of secular context by relating it to a discussion of plurality and deconstruction.

Secularity, Plurality and Deconstruction

The concept of 'secular context' is applied to describe Norwegian society generally, and the state school specifically. Despite the fact that 86% of the population in Norway are formal members of the Norwegian Lutheran Church (Statistics Norway, 2005), the majority of the population lead secularised lives in the sense that more and more sectors of their lives are perceived as independent of institutionalised Christianity. In Norway, eight out of ten Norwegians either never attend a sermon or do so less frequently than once a month. Following Luckmann (1967), it can be argued that this lack of church attendance does not necessarily imply a non-religious population, but rather indicates the possibility of an 'invisible' religiosity, i.e. a religiosity marked by an increased individualisation and privatisation (Martin, 1991). The Christian faith is no longer a taken-for-granted reality or, as expressed by Berger, Berger and Kellner (1973), 'religious definitions of reality have lost their quality of certainty and, instead, have become matters of choice. Faith is no longer socially given, but must be individually achieved...' (p.81).

From some points of view, which will be discussed below, the concept of plurality is more appropriate than secularity to characterise the social and cultural process in late-modern societies (Skeie, 1995; 2003). The concept 'secular context' is, however, retained because secularity, as explained above, dominates the mainstream discourse and provides the public context of Islamic nurture. A plurality of religions and values is, however, not only discernible but increasingly expressed both within a majority and minority context. Pluralisation is not only caused by immigration of people representing 'new cultures and religions', but also by social and cultural processes within the majority population. One consequence of pluralisation has been documented as increased secularisation in the sense of the privatisation of religion; another consequence is revitalisation of 'a sleeping religiosity' and 'the cultural heritage'. The interaction between an already secularised majority and a 'new' Muslim minority is essential for an understanding of the life world of Muslim children in Norway and in other Western societies. Another aspect strongly influencing the everyday life of Muslim children and young people is an increased Islamophobia (Lewis, 2003). For most Muslim children, Islam is what they value highest in life. Islam is for them synonymous with peace, love and all that is good in life. How then are they to understand that some people commit terrorist acts in the name of Islam? And how is it possible for a child to bear the burden of being directly or indirectly accused of supporting such acts? A general stereotyping of Islam and Muslims, in the media, from some politicians, and even at schools, has led to an increased experience of dichotomisation and discrimination. The period after September 11th 2001 has been especially difficult. Counteracting this negative development, recognition of diversity is needed. Religious and non-religious plurality of values should increasingly form the common frame of reference for majority and minorities.

Because of the loss of faith as something socially given or taken-for-granted, the situation of modern men and women has been characterised as

'a deepening condition of homelessness' (Berger et al, 1973, p. 82). However, such a characterisation does not express the experiences of Muslim children and young people in Oslo, despite their parents' immigrant history and the tendency towards marginalisation in Norwegian society. The following self-presentation was a typical expression of the children's feeling: 'We are Pakistanis, but Norway is our country. We are born here' (Østberg, 2003a, p. 161). This attitude will be elaborated by examining the distinction between traditional and modern religious plurality and by connecting this discussion to the concept of 'deconstruction' and 'cultural flow' (Hannerz, 1992, p. 4).

Traditional religious plurality 'indicates the existence of a variety of different religious groups or religious views in a specific context' (Skeie, 1995, p. 85). This description may characterise contemporary Western societies but is also a description applicable for earlier phases of Western history (e.g., the Roman Empire) and for other parts of the world (e.g., most South Asian countries). Modern religious plurality differs from the above description in the way that 'the number of different relations we take part in has increased, which in turn has multiplied both the number of perspectives and the speed of perspective-shifts' (Skeie, 1995, p. 87); that is, even if we belong to different religions or worldviews existing side by side in a given society, we are to a lesser extent locked up in separate 'worlds' than within a traditional plurality.

Individuals within a modern plurality are affected by the same cultural processes that affect their social context. Ethnic and cultural boundaries are permeable and Muslim children and young people operate with a diversified set of dichotomies. They are exposed to a 'cultural flow' more than to different 'cultures' existing side by side (Hannerz, 1992). Theories about how this type of social context may influence their identity management can be discussed within modes of deconstruction related to the concept of 'cultural flow'. First, the understanding of modern plurality or a post-modern perspective implies a deconstruction of the idea of 'the individual' as an undivided soul (a romantic view) or a rational 'whole' (a modern view) (cf. Skeie, 1995, p. 88). Secondly, it implies a deconstruction of the concept of social arenas as separated cultural 'sectors'. Consequently, social arenas like home, mosque and school, have not been found to represent different aspects of children's identity. Children's and young people's movement between these arenas has been found more essential for their identity management than are the cultural differences between home, mosque and school. Interaction, communication and negotiation between individuals and groups of people are of greater importance for an understanding of Norwegian Pakistani children's life-worlds than an understanding of home, mosque or school as separated 'cultures'. Children's and young people's attitudes to and preferences with regard to TV/video/music/Internet/mobile phones may serve as an illustration of their plural and deconstructed life-worlds. The content of what they are watching or listening to or writing is to a large extent out of reach for their parents and even their teachers. The new technologies give the young people a space of their own, which may imply that new ethnicities and social boundaries are being constructed.

Meaning and Social Belonging

As expressed by Berger: 'The social world intends, as far as possible, to be taken for granted. Socialisation achieves success to the degree that this taken-for-granted quality is internalised' (Berger, 1967, p. 22). Related to the discussion above concerning the conditions of late-modern plural societies in general and the minority situation in particular, this chapter raises the question of whether this type of successful socialisation is achievable for Muslim children in Norway. Interpretation of the findings has, however, repeatedly given evidence for the conclusion that the 'danger of meaninglessness' was avoided, and a 'nomos' was established. Muslim children in Oslo were not 'homeless', although their life-world was more complex and diversified than that of their parents.

Parallel to the mutual dependency of meaning and context within a hermeneutic paradigm, meaning and social belonging are found to be strongly interrelated as part of children's life-worlds. 'Cultural and social identity' is therefore maintained, as a cumbersome conceptualisation with reference to the plurality of sources nourishing children's and young people's identities. The empirical data conveyed a complexity of social groups to which Pakistani children felt they belonged or were attached: the extended family, Pakistani friends and neighbours, Norwegian schoolmates and teachers, Muslims of multi-ethnic origin, a multicultural neighbourhood, Norwegian society etc. The children's and young people's comprehension of being Pakistani in Norway exhibited a complexity that included aspects of cultural and social distinctiveness and a periodic, situationally dependent, denial of that distinctiveness. This kind of complex social belonging was formative for development of a 'multiple cultural competence' (cf. Jackson & Nesbitt, 1993) and constituted the social context for development of what in my study has been called 'integrated plural identity'.

Although there was a link between the establishment of meaning and the experience of social belonging, there was no direct link between their cultural identity and the social group with which a child or an adolescent identified in a given situation. Their cultural identity (i.e. the establishing of meaning) was, in other words, not derived from a social identity. The children and young people expressed social identities derived from their affiliation to or 'membership' of different social groups (e.g. schoolmates, a specific mosque, family), but they also expressed cultural identities, that is, consciousness of meaning, which transcended social groups. To give one example: children might express strong social identification with a specific group of Pakistanis (e.g. their extended family), but they might at the same time express 'ideas and modes of thought' (Hannerz, 1992, p. 7) not consistent with those of other members of that group. By comparing reflections, attitudes and religious practices of different generations (parents-children or elder-younger siblings), cultural diversities were discernible, even within socially stable groups like families. The cultural aspects of children's and young people's identities changed to a greater extent than social aspects, not least because the communication with 'others', so crucial to the development of a cultural identity, was an on-going process across group boundaries and within groups (compare the above discussion

of modern plurality). Children's and young people's self-presentations were for example seen to shift between a diversified set of 'us-them' dichotomies, that is, an ongoing communication with 'others'.

However, young people and young adults experienced boundary processes and processes of exclusion more strongly than they had done in their childhood. When they experienced boundaries that were difficult to cross, either in relationship to non-Muslim peers or to their parents, they used as the most common approach negotiations. As expressed by Khalid (17) when I asked whether his relationship to girls had changed:

It has changed 190 degrees! [sic]. I was really shy, but now, at school, I have got to know a lot of people. All keep together. I have got to know one special one who lives nearby. We met a Saturday two weeks back. Most Norwegian girls. I cannot speak with Pakistani girls. It has happened that I have told [my parents] that I am at training but actually I am with my girl friend. It is OK, but it may mean a little stress. Often I tell them I am just at my cousin's place. I don't think it will be any problems (Østberg, 2003b, p. 171).

In most cases negotiations were concerned with relationships with the other sex, drinking habits or staying out late at night. Sometimes negotiations also concerned interpretations of Islam. In both matters the Muslim young people are not very different from other young people of our time. As expressed by Marianne Gullestad (2001), there is a shift from obedience to negotiation based on the longing of young people to be themselves, to be authentic. The temporality and spatiality of children's and young people's life-worlds were shaped by a combination of secular and Islamic elements. Their everyday 'here and now' life-world was marked by a secular context but not divorced from experiences of a relationship between a 'here and now' and a mythical past, that is, a sacred time and space, for example through the linkage of qibla—Mecca—Hajj—holy water in the fridge at home—God's presence. Local, national and global social and religious networks were also found to constitute trans-territorial spaces in which they lived. How a sister and brother experienced a pilgrimage (umra) to Mecca in two quite different ways may illustrate the diversity of orientation within a Muslim framework. For Khalid (17), the visit to Mecca was like a holiday. He found it interesting to see how people in Saudi Arabia lived. His sister Saima (14) had another experience and she narrated from Mecca:

This time when I was there, I felt really proud of the big mosques in Mecca and Medina, [I] was almost touched and got very sad when we left. It is something quite different to see it in real life. It was quite another feeling to see it, to smell it, the Kaba itself. Would like to get that type of perfume. At the edge there is this hole and you see bits of stones from inside. That's where you kiss. Now I know it is not only fantasy. I am happy when I think about it! You feel you are not the only one. All are like you, all are with you (Østberg, 2003b, p. 174).

How Khalid and Saima experienced umra differently exemplifies the individuality of young people. As sister and brother they had been exposed to the same Islamic nurture; and, as children, there was no difference discernible in their attitudes and practices. Five years later, however, their commitment to Islam had taken different paths. Both were practising Muslims, but for Saima Islamic practices (hijab, umra, prayers and fasting) were important elements in her identity management. For Khalid, Islamic practices were something he took for granted and performed, but he did not express himself through these practices.

The Role of the Mosque and the State Schools in the Minority Situation

The mosques have been found to play different roles in the lives of children. They fulfilled religious, educational, cultural and social functions. These functions of the mosque are also found in Islamic countries and in countries with a Muslim majority (cf. Barton, 1986). Some aspects seemed, however, to gain importance or change character in the minority situation. The mosques both increased and lost importance. The mosques increased their influence within the Pakistani community for two reasons. First, they functioned as an educational arena contributing to the Islamic education of children. Many parents felt their children were given a much stronger religious training than the one they remembered from their own childhood in Pakistan. Some parents put increased weight on religious nurture because they wanted to influence their children while they were young and still willing to listen to their parents (Østberg, 2003a). The greater unpredictability of the future in a minority situation added a new dimension to the seemingly general attitude of a father's concern for his children. According to Geaves (1996), the stress on giving the children an Islamic nurture may be interpreted as a parental attempt to counteract what is regarded as the negative influence of Western society generally and of schooling particularly.

Secondly, the mosque gained importance as a social and cultural arena, primarily for men, but to a lesser extent also for women. This tendency may be attributed partly to the lack of a family network, partly to the 'rediscovering' of Islam. Women's role in this process has been attributed to their traditional dominance of the informal family sector including their support to the formation of educational institutions (cf. Shaw, 1994; Roald, 2001).

Pakistanis in Oslo who did not want to be involved in religious or political conflicts as part of mosque activities, but still occasionally (e.g. at festivals) wanted to perform prayers in a mosque, found it difficult to be present anonymously. This factor led to the opposite of what has been described above as the increased role of the mosques. It led to a privatisation of Islamic practice. The minority situation increased the consciousness of being an insider or an outsider within the Pakistani Muslim community. A 'middle-way position' was more difficult to practise in Norway than in Pakistan. Whether these experiences should be understood within the background of the minority situation (as parents seemed to think) or as typical for late-modern societies generally, is disputable. This study found that the tendency

to increased privatisation of Qur'an classes might be understood both as a normative and a liberal strategy. Privatisation may be identified as a typical expression of 'modern religiosity', that is, a weakening of institutionalised, official religiosity and a strengthening of 'invisible religion' (cf. Berger & Luckmann, 1995). Although the religiosity among Pakistani Muslims in Oslo cannot be called 'invisible' in the same way as the religiosity of secularised Christians has been, some of the alternative ways of organising Qur'an classes may be regarded as steps in the same direction.

The increased tendency to organise Qur'an classes independently of the mosques is interpreted as an expression of modernity in the sense that 'localised influences drain away into the more impersonalised relations of abstract systems' (Giddens, 1990, p. 140). In the context of this study, it means that whereas 'going to the mosque' to attend a Qur'an class was often part of a local community activity (something neighbouring children did together), attending a private Qur'an class in a suburban area was part of a sector of life connecting children to a worldwide (abstract) Muslim community, but one hidden from school mates or neighbouring peers.

This study gives evidence for a diversified, even contradictory, set of attitudes within this mode of 'late-modernity'. Both actively practising and non-actively practising Muslims were found among the families who had chosen a private solution concerning Qur'anic teaching for their children. This implied that 'not going to the mosque' did not indicate a specific religious attitude. Among some respondents, private Qur'an teaching meant that high priority was given to this education both with regard to costs and time invested. According to some parents, the investments were not wasted because they gave a good result, that is, recitational skills and the internalisation of Islamic values.

Among others, private lessons were chosen as a minimum investment. These caused less inconvenience for children because they could be adjusted to other activities, like school and sport. This attitude was found both among parents with a liberal religious attitude and among more normative Muslims. Being a good Muslim was still an aim of the upbringing but it was somewhat detached from the knowledge of Qur'an recitation. Some of the more 'normative' (e.g. the Deobandi or the Jama'at i-Islami oriented) defended this attitude by underlining a moral standard as more important than rituals.

Islamic institutional development in Oslo is in accordance with recommendations given by some Muslim writers concerning growing up in a multicultural secular society:

As far as the Muslim community is concerned, its duty is to see that children get habituated to prayer and the recitation of the Qur'an from childhood. Parents have to undertake that job and the community has to arrange for week-end schools. Mosques should be utilised for this purpose (Ashraf, 1993, p. 11).

Neither of the two tendencies identified above can be regarded exclusively as a minority phenomenon; they are rather typical of a late-modern, urban way of life.

The same tendencies are found in cities in Pakistan and in other parts of the Muslim world, especially among the upper and middle classes of the population. Among the upper class, private Qur'an lessons have always been common because rich people could afford to pay for a good teacher. The new situation, especially in cities like Oslo, is that privatisation of Qur'an classes is more common among the middle class as well. The motivation may, as we have seen, be either to secure a qualitatively good training or to make such a training as convenient for children as possible by not letting the Qur'an class be a hindrance to their participation in other social activities. The minority situation strengthens a development that is generally discernible in late-modern societies: the tendency to institutional formation and to individualisation.

Modern Plurality and Integrated Selfhood

Since the formation, development and management of personal identity is unthinkable without interaction with 'others', there will always be a relationship between individual and collective elements of personal identity, that is, of what is specifically individual and what is shared with others. Identity is not only formed by social processes but 'it is maintained, modified, or even reshaped by social relations' (Berger & Luckmann, 1966, p. 194). Identity is not defined in terms of individual properties but places us in some social space (Østberg, 2003; cf. Taylor, 1991).

The theory of 'integrated plural identity' is embedded in a hermeneutical paradigm, that is, in a semiotic understanding of reality (Berger & Luckmann, 1966; Geertz, 1973; Ricoeur, 1971, 1981). Reality is within this paradigm regarded as socially constructed and a human is accordingly an animal 'suspended in webs of significance he himself has spun' (Weber, as cited in Geertz, 1973, p. 5). An interpretation of these significances is a presupposition for understanding. Similarly 'identity' is not a given entity to be discovered, but a symbol to be interpreted.

The concept 'integrated plural identity' is chosen to express the dual character of Muslim children's and young people's identity: its changeable, fluid, shifting character on the one hand and its stability or 'integratedness' on the other, that is, a dynamic stability. The term 'integrated' is used in the same way as the term is applied when 'integration' is contrasted to 'assimilation': for example, in the integration of immigrants as distinct from assimilation of immigrants. Integration is also conceptually related to the concept of integrity which will be explored below. 'Integrated plural identity' implies the retention of plurality, diversity, instability, fluidity and contextuality without the individual's losing a sense of 'self'. The concept of 'self' is here used according to Ricoeur who distinguishes between 'self' as *idem* (sameness) and as *ipse* (selfhood) (Ricoeur, 1990).

The concept of 'self' as '*idem*' indicates sameness in the meaning of being identical with, whereas 'self' in the sense of *ipse* implies no assertion concerning some unchanging core of the personality. (Ricoeur, 1990, see p. 2). Ricoeur emphasises the ongoing conversation with 'others' and with 'oneself as another' in the process of identity development and management. The focus is not on who

I am, but on who is asking this question [of identity]. Ricoeur says: 'Oneself as Another suggests from the outset that the selfhood of oneself implies otherness to such an intimate degree that one cannot be thought of without the other,' (Ricoeur, 1990, p. 3). The concept of narrative identity is applied by Ricoeur to characterise the communicative and interpretive aspect of the identity process (Ricoeur; cf. Meijer, 1995). Personal identity is formed by an on-going conversation with 'oneself as another', that is, a dialectic between sameness and selfhood, and by situating personal identity in history. As expressed by Meijer in her interpretation of Ricoeur: 'One's biographical story restores unity by bringing coherence into diversity, continuity into changes of one's life, including the changes in oneself' (Meijer, 1995, p. 94).

Muslim children's and young people's reflections on who they are will, in a Ricoeurian sense, be regarded as more crucial for their identity management than the answers given in different contexts. As narrators of multiple narratives they expressed a diversified set of cultural and social identities; but, on a personal level, this diversity or plurality did not threaten their personal integrity. They were the narrators or the interpreters of their own lives. As long as the children communicated a diversified set of identities (Pakistani, Muslim, Norwegian, Norwegian-Pakistani, Punjabi, Asian etc.) to a diversified set of 'others', they 'narrated' themselves through an interpretation process and in this way developed their selfhood (cf. Meijer, 1995).

However, in my view, children's and young people's interpretive reflexivity should not be understood solely as intellectually based, but rather as 'embodied', that is, grounded in bodily and sensory experiences. This finding is not attributed to the young age of the children but to an epistemology which situates our understanding of human beings in their way of 'doing' things (cf. Vertovec, 1992). For example, when the children did not possess the appropriate terms for describing aspects of Islam in their lives, this was not necessarily an instance of 'lack' of knowledge; it was because their knowledge was of a different kind, that is, embodied. In Taylor's words: '...our bodily know-how, and the way we act and move, can encode components of our understanding of self and the world' (Taylor, 1991, p. 309).

Conclusion and Implications for the Classroom

This chapter has argued that religious and cultural traditions were mainly transmitted informally through parents and other significant others at home and in the mosque. Norwegian Pakistani children were socialised into becoming Muslims and Pakistanis and they did not distinguish clearly between the two identities. They were, also, socialised into being Norwegian through formal schooling, media influences and inter-action with non-Muslim friends.

The bodily and sensory aspects of Islamic nurture and the interwovenness of Islamic and Pakistani cultural elements were found to dominate primary socialisation at home and in the mosque and to contribute to the shaping of their embodied knowledge. Another decisive aspect of Islamic nurture was formal educational

training through the Qur'an schools, either in mosques or in private homes. Children had to learn to pray, to read the Qur'an, to purify, dress properly and respect food restrictions. The combination of formal educational elements and informal bodily and sensory aspects, especially related to gender socialisation, strengthened the role of Islam in children's lives, as part of an everyday practice and as potential religiosity.

Islamic practice, or the knowledge of Islamic practice, as part of their everyday life-world, contributed to the development of their social and cultural identities, regardless of type of mosque affiliation or degree of practice. A reference to the combination of informal socialisation at home and the institution of Qur'an schools is not simply an answer to the question concerning the 'how' of the transmission process. This institutional combination of strengthened socialisation offered the children arenas for social belonging and 'construction of meaning'. The meaning of their life-world was not fixed and static, and not exclusively bound to these arenas, but highly attached to them. Socialisation at school and through the media and with non-Muslim friends extended their cultural identity by broadening their perspectives without implying a de-socialisation of Islamic values. Formal schooling was no threat to their Islamic and Pakistani identity but rather irrelevant to it. In the development of integrated plural identities, Islamic nurture was part of that plurality; and had an integrating function through its role in primary socialisation and through its special combination of formal educational and informal bodily and sensory elements. Islamic identity was not simply one among many aspects of their plural selves: there was a plurality within their Islamic identity.

Norwegian Pakistani children, rather than being understood as victims of cultural clashes, have been found to display 'multiple cultural competence' and strong reflexivity by being exposed to diversified communication with 'others'; and to be engaged in a continuous interpretation of their own position.

Some implications for the classroom may be drawn from these findings. First of all, there is a need for teachers to avoid stereotyping Islam. Islam as experience and practice is more multiple and varied than a fixed set of doctrinal beliefs and religious duties (cf. Ipgrave, 1998; 2002). Different communities exist within Islam in the diaspora as well as in societies dominated by Muslims, and there are individual varieties within each community. Interpretations and negotiations are part of the Islamic world as they are part of other religions. Pupils should be encouraged to consider the relationship between individual 'believers' and the larger faith community as a general approach to religions (Jackson, 1997; 2004). Rethinking religious education and plurality is of special importance today against the background of the present dominant 'Islamophobia' of the Western world (Østberg, 2003d).

Secondly, and an implication especially relevant for societies discussing whether to offer religious instruction (within a specific faith tradition) or to offer a common religious education to all pupils: there is no reason to believe that Muslim minority children will be confused by a multi-faith approach to religious education. Cultural and religious plurality is already the context of their Islamic nurture. On the contrary,

being exposed to multi-faith teaching in the classroom may supplement their Islamic nurture both with regard to communicative knowledge within their own tradition and with regard to a broader and educationally based insight into other traditions (Hull, 1996; Jackson, 2003; 2004). For them, not least as citizens of Christian secularised societies, there is a need for sound knowledge of Christianity in all its variations of past and present. Anthropological, interpretive and educational approaches to religions (including Christianity) would be in accordance with the plural life-world of both minority and majority children and would not only contest stereotypes and acknowledge individual variations but also take children and young people's existential questioning and religious beliefs and practices seriously.

Acknowledgements

HANDING ON RELIGIOUS VALUES TO YOUNG ORTHODOX PEOPLE IN A WESTERN, SECULARISED SOCIETY

Richard Rymarz

Australian Catholic University, Melbourne

Introduction

One of the critical issues facing Christian Churches today is that of maintaining the allegiance of youth, understood here to describe those in late adolescence, aged between approximately fifteen and twenty years of age. This is a critical time as individuals move beyond parental control and seek to establish their own identity (Kay & Francis, 1996). The persistence of religion largely depends on how successful one generation is in passing on its belief and practices to its offspring (Meyer, 1996). The importance of inter-generational transfer of religious beliefs and practices has been commented on in a variety of studies spanning numerous faith traditions (Bendroth, 2002; Goa, 1989; Keysar, Kosmin & Scheckner, 2000). Contemporary Western societies, however, present challenges to the transfer of beliefs and values for many so-called mainline religious groups, such as Catholic and established Protestant traditions. (Davie, 1994; Finke & Stark, 1992; Kelley & de Graaf, 1997). Orthodox Christians, whilst relative newcomers to Western societies, experience many of the challenges that face members of mainline Churches.

Orthodox Christians here are defined as those Christians that belong to Churches arising from the ancient Patriarchal Sees of Constantinople, Alexandria and Antioch. Such a definition encompasses both large Eastern Orthodox groups such as the Greek Orthodox Church and smaller Oriental Orthodox traditions such as the Coptic Orthodox Church. The historical roots of Orthodox communities lie in the Middle East and Eastern Mediterranean, and, in later times, in Eastern Europe. Over the last hundred years, however, many Orthodox communities have been established in Western countries such as France, England, the United States and Australia and it is to the experience of these communities that this chapter will be devoted. A key factor in understanding the challenges facing Orthodox youth in Western countries

is the need to recognise that as relatively recent arrivals they are not, comparatively speaking, large communities.

The challenges facing Orthodox youth in Western countries can be grouped in three areas. The first is the possibility that identification with a national group may override religious allegiance. For many Orthodox youth being Orthodox is almost synonymous with being part of an ethnic group. Secondly there is a range of issues that relate to the problems of maintaining a traditional culture alongside the demands of life in a Western society. The richness of Orthodox tradition is difficult to live out and translate into a Western context which is often regulated by concepts which are quite foreign to many Orthodox Christians. The third area relates to the challenges associated with the passing on of a faith tradition that involves difficult and abstract theological concepts. Orthodox youth need to be able to integrate mystical and cognitive ways of attaining religious knowledge.

The Question of National Origin

Orthodox Christians are usually identified with a particular ethnic or national group. This is often expressed in the group's self-description, such as Greek, Serbian or Russian Orthodox: a descriptor of both religious and ethnic identity that can lead to confusion. Young people can have trouble distinguishing between ethnic origin and religious beliefs and practices. Maintaining an ethnic identity in a Western context with an emphasis on language and other salient features of ethnicity can be difficult (Chai, 1998). These issues are compounded, however, when religious beliefs are also included within ethnic identity (Ebaugh & Chafetz, 2003).

When Orthodox youth attend community events, for example, is this an affirmation of their ethnic or their religious identity? The close connection between nation and religion is a special feature of those Orthodox traditions which spring from a Byzantine ecclesiology (Chadwick, 1964; Ware, 1979). Here the Emperor was, in classical times, the head of both the State and the Church (Hussey, 1986). One implication of this was that the Patriarch, the senior bishop, was subordinate to him. Whilst the time of Christian Emperors has long since gone, the relationship between Orthodox Churches and states often leads to a merging of national and religious identity, especially in countries where Orthodox are both new arrivals and a minority (Athanasou, 1989). The close association of the Church with national groups is known as *phyletism* (Clarke, 2000). It is difficult to distinguish ethnic from religious factors but the strength of religious beliefs and practices is diminished if they are made subordinate to or contingent on more general expressions of ethnic or national origin (Ata, 1989).

The consequences of phyletism can be manifested in at least three ways. Firstly, by identifying with Orthodox Christianity, the young person can also be associated with a host of ethnic and national tensions. To what extent are young Orthodox believers in the West expected to immerse themselves in the ethnic conflicts of the old world? A recent example of this has been the civil war in the Balkans. On one level it may be associated with high levels of concern for the perceived

injustices on the various ethnic groups involved. On another level some may try to distance themselves from the conflict as it is something which properly belonged in a European forum.

Secondly, phyletism can lead to a type of social isolation where the group does not see beyond ethnic boundaries to common links with both other Orthodox communities and other Christians. This cuts off the Orthodox youth from other like-minded individuals thus prescribing their social group. Networks of affirming believers are an important part of sustaining Christian commitment in Western cultures (Allen, Wilder, & Atkinson, 1983; Erickson, 1992). This problem is compounded by some of the historical tensions between Orthodox groups. Some of these are relatively recent and relate to juridical issues such as the dignity and freedom of national Churches. For example, the status of the Macedonian Orthodox Church is a matter of some dispute amongst Orthodox believers (Poulton, 1995; Shea, 1997). Do Macedonian Orthodox youth see themselves as part of a strictly national Church or part of a wider fraternity of Orthodox believers? The sense of being part of a much wider supranational group has important implications for personal identity. This is especially true when the boundaries between the faith community and the wider culture become less important and this is the case in many Western societies (D'Antonio, Davidson, Hodge & Meyer, 2001; Hoge, Dinges, Johnson, & Gonzales, 2001). Whereas it may have been important to identify with a close group of associates in the country of origin, this is not as critical in a Western country where teenagers seek to define themselves as part of larger more inclusive communities (Donelson, 1999; Dudley & Dudley, 1986; Meeus, 1996). For many immigrant Orthodox youth the world that their parents grew up in, which was often based on being part of ancient rural communities, is not something to which they can easily relate. The bonds of family and clan which are important to older generations also do not have the same hold on young people who are growing to maturity in a culture that does not esteem kinship bonds.

Thirdly and perhaps the most important consequence of phyletism is that it runs the risk of separating young Orthodox Christians from the great animating principles of religion. Stark and Fink (2000) describe religion as the exchange between the individual and God: a sense that the individual is able to have a direct and personal relationship with an all-powerful and all knowing Deity. According to Stark and Fink this brings with it great costs but also great benefits. If this fundamental relationship is obscured by feelings of national and ethnic origin, the vitality of the religious tradition is severely imperilled because the young person could see religious belief and commitment not as a direct experience of the transcendent but as being part of a national group. The interests of a particular national group may ebb and flow. The reward of religious belief, to use Stark and Fink's terminology, should be independent of political affiliation, because at the heart of this relationship is a personal bond that links the believer with the divine and transcendent. This also has implications for how Orthodox youth see the Church. A Church which identifies itself most strongly as a teacher and protector of the relationship between the individual and God is likely to retain the allegiance of youth (Iannoccone, 1994;

Reeves, 1998). The view of the Church as being an icon of God is one that is strong in much Patristic theology (Kelly, 1989). This view can be compromised if the Church becomes too identified in conflicts that even the most dedicated member can see are ultimately caught up with political and worldly questions.

There is evidence that some Orthodox communities have dealt relatively successfully with the challenge of phyletism by stressing the religious identity of the group over its national affiliation. An example of this is young people who are members of the Coptic Orthodox Church. Coptic youth report high rates of affiliation to the Church (de Souza & Rymarz, 2003). Part of the reason for this is that Coptic self-identity is itself based on strong religious views, which are historically based (de Souza & Rymarz, 2004). The divisions between Copts and other Orthodox groups go back to Patristic times and the great early Councils, with a formal split occurring after the Council of Chalcedon in 453CE (Young, 1983). Copts have an interest in the theological disputes of these Councils and express their identity by tenaciously holding on to the traditions and dogmatic teachings of Church (Malaty, 1987). This in turn leads to a conviction amongst Coptic youth that they are in close contact with God and that God is interested in them and their welfare and this affects the way they live. This is how one Coptic youth expressed some of the motivation for the way that they behave:

When dealing with other people, we do things from a more 'what's right, what's wrong' perspective or 'would this please God or wouldn't it'. I wouldn't say that we're better than other people, we're not, we are all equal, but we struggle to do well and we struggle first of all to please God, to glorify Gods name. I haven't seen many other cultures do that (de Souza & Rymarz, 2003, p. 69).

Another aspect of Coptic identity is the strong links that exist with the tradition. This is expressed in a number of ways such as their pride in being the successors to St Mark the Evangelist the first bishop of Alexandria; it is not merely because their Church originated in Egypt. Copts' experience of being *outsiders*, both in Islamic Egypt and in the Chalcedonic Orthodox world, *has* left them with a cultural resistance that is unusual amongst Orthodox Christians (Wakin, 2000). Here is how one young Copt expressed this idea:

If you lose your traditions, you lose your background and you change so I guess our Church really stuck at it. I mean that's the whole idea of our Church, we stuck at it from the very start. What we got from St Mark has been passed down, it has never changed...(de Souza & Rymarz, 2003, p. 70).

This is a Way of Life

A critical aspect of religious enculturation is the role of family (Boojamra, 1989; Mikhail, 1992). This is true for all religious groups not just the Orthodox; but it may be of especial importance for Orthodox Christians as the family is seen as

the context in which a person learns not so much about Christianity but rather about ways to be a Christian (Magdalen, 1996). Orthodox communities experience the family pressures that are common in Western countries such as the difficulty in combining work and family, marriage breakdown and declining birth rates (Bowes, 2004). If the family structure is impaired, the Orthodox face substantial challenges in the attempt to pass on not just a sense of their tradition but also a lived experience of it (Magdalen, 1995). If the family comes under pressure this results in a fracturing of the communal religious life (Francis & Katz, 2000). This has a strong impact on young people who seek peer support and affirmation. If this is not available through the faith community then they are likely to find it elsewhere.

The centrality of the family to Orthodoxy can be seen by a number of ritual practices which emphasise the point that the family is the cradle where Orthodox belief and practice are nurtured. House blessing is an important event in many Orthodox traditions. This takes at least two forms. First there is the annual blessing which commemorates the Baptism of Jesus in the Jordan. It is significant that the priest comes to the home of the family to mark this important feast, which is one of the most solemn in the Orthodox calendar. The second blessing is a longer ceremony that occurs when a family first moves into a home. Both blessings recognise that the family acts as a conduit for the actions of the Holy Spirit in nurturing the faith commitment of all family members.

Another example of the sacredness of the home and family in Orthodox thinking is the way in which icons are often displayed in Orthodox homes. This parallels to some extent what happens in Orthodox churches. Icons are not primarily representations of religious events (Evdokimov, 2004). They are invitations to those who look upon and pray before them to contemplate another world and to acknowledge the immediacy of God to the life of the believer (Vrame, 1999). The fact that icons adorn homes is a reflection of the Orthodox belief that the home is a place that must be fundamentally concerned with the spiritual transformation of youth.

Orthodox youth can also face wider difficulties in a culture that, whilst not openly hostile, does not support their traditional beliefs and practices (Schmemmann, 1969). Many of the social and moral expectations, for example, placed on Orthodox youth, especially women, are not in accord with Western norms. Tensions can arise when the Orthodox way of life is seen as involving too many burdensome regulations (Walker & Carras, 1996). These tensions are most pronounced in those communities that are most integrated into the wider society. This problem can become especially acute if it is associated with a historical memory of the country of origin. The increased religiosity of immigrant ethnic groups has often been associated with the need to establish a clear boundary between the new environment and the immigrant community (Haddad, Smith, & Esposito, 2003). For Orthodox youth in a Western context, this may translate into expectations of them that even their contemporaries in their countries of origin would find restrictive: parents are often unaware of changes in cultural norms in countries of origin. Many Orthodox youth have expressed to me their annoyance about restrictions that are placed on

them in the name of preserving cultural identity; restrictions which now do not apply to family members of similar ages in the country of origin.

Orthodox life is typified by a variety of religious rituals that play an important part in sustaining the cultural and religious identity of youth. To keep these practices alive and vibrant is a critical challenge. In their lands of origin, supported by social conventions, Orthodox Christians had developed behavioural patterns which allow for the social expression of religious belief and practice. The idea of prolonged fasting, for example, an important Orthodox practice, is well supported by both Christians and Muslims in the Middle East and elsewhere. Fasting in a Western context, in contrast, is seen as an unusual practice (Greeley, 1985). Preserving ritual practices, such as fasting, is important for two reasons. Firstly they allow for *a way into the tradition* for youth, that is, a mechanism for expressing their religious identity that identifies them with the faith community. Secondly they provide a boundary that distinguishes Orthodox youth from those in the wider culture. Both aspects of ritual practice are important in sustaining the religious allegiance of youth.

The most important ritual for Orthodox Christians is the Divine Liturgy. This is at the heart of the communal life of Orthodox traditions. The Liturgy is a long and elaborate ritual, which can be difficult to fit into a busy weekend schedule with many competing demands. Yet the Divine Liturgy represents the epitome of Orthodox belief and worship (Meyendorff, 1979; Schmemmann, 1974). It is often said of Orthodox Traditions that the key to understanding them is to ask not what their members believe, but how they worship (Clendenin, 1995; Cross, 1988). In Orthodox Churches the liturgy is celebrated with devotion and splendour. This can be seen in the interior of an Orthodox Church which is ablaze with colour, from the numerous icons and the light from candles. It sets out to create an atmosphere that seeks to recreate the world to come, a vision of heaven. In trying to convey to youth a sense of this transcendence and of the critical importance of the Divine Liturgy, the Orthodox community is faced with some significant challenges. The whole Western mind-set seems to work against a proper Orthodox conception of what is taking place in the liturgy. This is not a simple worship service or something similar. The Divine Liturgy expresses, in the most perfect way, the mystery of the Church as the Body of Christ and reveals and makes present Jesus (Zernov, 1961). The liturgy also has an important educative role presenting, through prayer and action, the most important teachings of the tradition. To appreciate fully the significance and majesty of the Divine Liturgy, however, requires the believer to take part in its celebration as well as try to comprehend its significance. This is not a straightforward matter for youth who are growing up in a culture which, in general, has a different view of the place of the transcendent in everyday life; a perspective that seeks to internalise the transcendent rather than express it in a public and communal form (Mantzarides, 1996). How Orthodox traditions articulate their understanding of the transcendent (expressed most perfectly in the Divine Liturgy) is of critical importance in assisting their youth to make the transition to adult participation in the faith community.

Passing on the Faith

Apart from membership of an Orthodox family and an integrated faith community, how do Orthodox youth gain an understanding of the religious beliefs and practices of their faith community? This question has two aspects. The first is relatively straightforward and relates to largely organisational and structural issues such as the development of educational programmes and the establishment of schools and other institutions. The second is more challenging and concerns the ways in which Orthodox communities view religious knowledge and enculturation.

In comparison with both Catholic and Protestant traditions, Orthodox communities lack educational support. Orthodox youth often do not have the support of specific educational initiatives, such as schools and universities that cater for their needs. In Australia, for example, many Orthodox youth attend Catholic or other Christian schools in the absence of ones for their particular community (Dwyer, 1986). Many Orthodox youth are, therefore, exposed to curricula that have been developed for other Christian communities and their inherent perspectives (Nicozisin, 1977). The lack of established schools often results in an undeveloped religious education as far as Orthodox young people are concerned. To compensate for the relative lack of schools and colleges, the local Orthodox Church becomes an important focus for a wide range of activities that must cater for a variety of ages. Without proper planning and support, local communities can struggle to develop these services, and young people are left feeling that they have been neglected or excluded. This is only partly alleviated by weekend activities such as Sunday schools or programmes run in holiday periods to help Orthodox youth understand their religious heritage.

A deeper issue for Orthodox communities relates to their perception of the nature of religious knowledge. One of the most significant historical debates amongst Orthodox Christians concerns the ways by which religious knowledge is acquired (Boojamra, 1989). In contrast to members of Western traditions, Orthodox Christians have been more interested in a mystical approach to attaining religious knowledge. This is not gained through any one sense but by engaging all of them. This type of thinking is often associated with the *Hesychast* approach. A Hesychast is someone who, literally, seeks communion with God through stillness. This stillness is to be achieved by constant repetition of a prayer or mantra, most usually *Lord Jesus Christ, Son of God, have mercy on me* (Lossky, 1957). This leads to a direct and complete appreciation of the power of God and how this can be integrated with daily life. The philosophical argument about the place of Hesychastism in Orthodox life was a strong theme in the thirteenth and fourteenth centuries; it was largely resolved by an endorsement of this approach as a critical way to gain religious knowledge (Ostrogorsky, 1968).

The Hesychast approach can, moreover, be contrasted with a more typically Western approach which places more emphasis on a cognitive or intellectual grasp of religious knowledge (Rossiter, 1982). Much Western education is premised on this understanding of religious knowledge and so much teaching is directed towards

gaining an understanding by cultivating the intellect. What is lacking here from an Orthodox perspective is a sense of the whole, where all the senses encounter the divine. The tendency of schools in Western settings to place more emphasis on cognitive learning and less on mystical holistic approaches leaves Orthodox youth disconnected from one of their traditional ways of knowing and learning. It also leads to significant challenges when presenting the Orthodox tradition to students in an educational setting.

Many of the core beliefs of Orthodox Christians flow from rich and complex theological positions. Whilst these dogmas are held tenaciously they can be difficult to pass on to younger generations who are steeped in the highly secular discourse of Western societies and who have not benefited from targeted educational programmes (Tarasar, 1990). One example of the difficulties facing Orthodox youth as they try to understand critical, but difficult, parts of their tradition is that of comprehending Trinitarian teachings. Trying to convey the pivotal nature of the Trinity in many aspects of Orthodox belief and practice is a critical challenge. Trinitarian beliefs derive from the common experience of the Patristic period but involve technical and precise language that is often difficult to explain even to young people who have a high level of secular education. This can lead to a cognitive dissonance between the professional knowledge of the young adult and his/her religious beliefs. In the case of Orthodox young adults, it can lead to their worldviews becoming more secular and akin to those of the prevailing culture.

The difficulty in passing on these complex beliefs is compounded by typical Orthodox pedagogy, which often begins with a statement that is reflective of the depth of Orthodox thinking but which is very difficult to explain. The contrasting treatments of a Christological topic in Western and Eastern Christian contexts illustrates this point (Rymarz, 2003). In Catholic schools Christ is often introduced without direct reference to the Trinity. Western practices, following Rahner, are often heavily Christocentric beginning with a low Christology and then ascending to a more complex understanding (Egan, 1998): catechetical programmes may begin with a presentation of Jesus as a friend or mentor as a prelude to a gradual unfolding or development of the theme. The Orthodox Trinitarian emphasis is to some extent in tension with this approach. It is regarded with some suspicion by the Orthodox because its departure point makes a dangerous assumption about the nature of the Godhead, that is, that one can readily separate the human and divine in Christ (Athanasou, 2002). Whilst theologically sophisticated, this point does lead to an educational impasse. How does an Orthodox educationalist proceed in areas such as these?

A common feature of Orthodox pedagogy is to begin with an immersion in the Trinity (Elias, 2002). The Trinity is represented in art and in countless other ways in the lives of the faithful. Many Eastern prayers, for example, include or end with the invocation of the Trinity. Delving into the exact doctrinal formulations of Nicaea, Ephesus and Chalcedon requires precision with language, and can be too dense for secondary students. However, as Eastern Christians' theological vision is so heavily Trinitarian, to be faithful to this vision it is necessary to make some attempt to encounter this teaching.

An Eastern approach is far more likely to begin with a strong doctrinal statement that tries, as far as possible, to express in human terms an aspect of God's interaction with the world and then attempts to *unpack* or explain the statement (Elias, 2002). This type of immersion in doctrine runs the risk of losing students at very early stages, especially if it is done too often. But it does allow for the mystery to be stated as clearly as possible and perhaps to cultivate student interest.

In a similar vein it is often difficult for Orthodox youth to gain a sense of the importance of the Patristic writers for them and their tradition. These writings were crucial in shaping Christian belief and practice in the post-apostolic period. The Eastern love of Patristic writings is well known and much Orthodox teaching is grounded on the authority of the Patristic writers (Hall, 2002). For contemporary religious education, the idea of using the Fathers of the Church does offer students a change in the regular offering of saints and heroes. The problem remains, however, of how to convey a sense of the importance of the writings of these revered figures who lived in a time and culture that is far removed from contemporary discourse. Orthodox youth often question the relevance to them of Patristic writers, many of whom lived solitary and ascetic lives. In addition to this there is the issue of the themes of much Patristic writing. Such texts are heavily theological using philosophical categories that were common in the period of the great Councils but which are not widely known today.

Conclusion

This chapter has addressed some of the challenges facing Orthodox communities living in Western societies. The definition of the term Orthodox used here encompasses a wide range of traditions and perspectives. The three themes identified, the close identification of religion and nationalism, the stress imposed on Orthodox ritual and family life, and the problems associated with passing on an understanding of the faith traditions may have general applicability. This should not obscure the fact the different traditions, however, meet these challenges in different ways. In the future the commonality of Orthodox perspectives with other communities who seek to pass on religious beliefs and values may become more important. Some traditions, such as the Coptic Orthodox, may be more successful in passing on belief and practices than others. The questions that are posed here are how do some communities achieve this and do these strategies have general applicability?

THE TREATY OF WAITANGI: IMPLICATIONS FOR CHRISTIAN THEOLOGICAL EDUCATION IN AOTEAROA NEW ZEALAND

T. John Wright

St. John's College, Auckland

Introduction

<i>Aue te mamae i ahau e</i>	<i>Oh how I hurt within</i>
<i>He aroha e te iwi e</i>	<i>With sadness for the people</i>
<i>Mo tatou katoa e tukinotia nei</i>	<i>Who are being exploited</i>
<i>E nga tauwiwi o te ao</i>	<i>By those from another world</i>
<i>Ka titiro ra nga mahara</i>	<i>I look for a solution</i>
<i>Ka mohio te ngakau e</i>	<i>And my heart tells me</i>
<i>Ko te Tiriti o Waitangi e</i>	<i>The Treaty of Waitangi</i>
<i>Te oranga pumau e</i>	<i>Provides the hopeful promise</i>

(Smith, 1997, p. 212).

This is the first verse of a Māori action song composed by Tuini Ngawai of Ngāti Porou in 1959. It depicts the social and economic plight of that group of Māori, who are the tangata whenua, 'the [indigenous] people of the land', who reside on the East Cape of the North Island. This area is geographically remote, economically deprived, educationally weak, and socially challenged. However, this scenario is not confined to that 'tribe'. Most Māori can identify with the sentiments expressed. This verse promotes the Treaty of Waitangi as a possible path out of their plight.

Tania Rei, of Victoria University of Wellington, in response to a question as to 'what must non-Māori do to give effect to change to meet Māori aspirations?' for education replied that 'the preferred framework ... would be the Treaty, and as the non-Māori partner to the Treaty the Government has to ensure that Article 2 and Article 3 rights are met' (Tapine & Waiti, 1997, p. 66). This particular interpretation of the Treaty and its significance for contemporary Māori in all walks of life,

including that of theological education, is dominant in contemporary Māori and liberal non-Māori thinking. The debate in the social, cultural, juridical, political and educational arenas is underpinned by the debate concerning the Treaty and its role in contemporary society. In 2004 alone five books on the story and the significance of the Treaty were published primarily for the interested public (Evans; Moon & Biggs; Orange; Slack; Stenson) and two on the Treaty of Waitangi Tribunal (Byrnes; Hayward & Wheen). This paper sets the role of the Anglican Church within education in this context. It focuses especially on St. John's College as a provider of Christian theological education and the working out of the significance of the Treaty for that task.

Treaty of Waitangi

How to relate to the indigenous peoples has been a major issue ever since the arrival of the European world into the south pacific, hitherto unknown to the west. This was complicated by an inter-European rivalry with respect to lands and resources to be appropriated and incorporated into dominions. Different models were utilised by differing European nations and even by the same nation. In Aotearoa New Zealand, because of gradual infiltration by a range of groups from whalers to convicts to settlers, the British crown, even if initially somewhat reluctantly, took on itself responsibility for this land and all its peoples, both indigenous and newly arrived.

In February 1840 at Waitangi, a treaty was signed between the first governor, Hobson, and about 43 chiefs (and eventually by 500 more). However, not all chiefs endorsed it. Nonetheless, as far as the British and most Māori were concerned, the peoples of New Zealand had ceded that land with the right to govern (Article 1), and in turn the British had granted Māori 'all the Rights and Privileges of British Subjects', the protection of the Crown (Article 3), and at the same time allowed Māori to have unfettered control and use 'of their Lands and Estates Forests Fisheries and other properties which they may collectively or individually possess' unless they chose to sell their property to the Crown (Article 2). Law and order had been imposed on all. At the end of the initial signing Governor Hobson declared, 'we are now one people', a declaration that does not sit well in the current political climate. Yet, this statement is still utilised by the current Governor General as an ideal, but with a different emphasis: 'We two peoples together make a nation' (Cartwright, 2004; Metge, 2004). There was, and is, a potential for transformation in which the land and its peoples would be blessed. Initially, the signing of the Treaty allowed colonisation in all senses of that word to proceed at an increasing rate, with the consequential pressures on the indigenous people, including demand for land by the settlers, and the ever-increasing marginalisation of Māori.

The written Māori version of the Treaty (te Tiriti), does have significant differences from the English version (Biggs, 1989; Ross, 1972; for full texts of the Treaty see Appendices 1 and 2 of Orange, 2004; or State Services Commission, 2005). For most of those commentators who today accept this version as definitive, te Tiriti is understood as a partnership between two equal and sovereign peoples, the Māori

and the Crown. The new comers were welcomed into the land and now had their place by right. There were two cultures, two peoples, two heritages, and peoples of two stories, living in the same land, honouring each other and working together in partnership.

The status of the Treaty has had a chequered history (Gilling & O'Malley, 2000). It is only since the 1980s that it has been incorporated into legislation. Over most of its history, the Treaty was 'a time bomb waiting to explode' (Sharp, 1997, p. 428). Although there were occasional attempts to address issues arising from the existence of the Treaty, throughout the nineteenth and twentieth centuries successive governments and their officials, including the judiciary, pursued policies of integration which led to assimilation and absorption of Māori into the dominant 'colonial' culture and philosophy. That the government of the day normally set the agenda on its own terms meant they drove the rhetoric and shaped the social construct: illustrated by, for example, The Treaty of Waitangi Tribunal itself, together with the principles of the Treaty and partnership.

Treaty of Waitangi Tribunal

Inaugurated in 1975 as a commission of inquiry to hear Māori claims and advise on future actions, the Tribunal had to determine what the 'principles of the Treaty' were and take into account the 'moral obligation' of the Treaty. It is an advisory rather than a legislative body. Interpretative processes have evolved that affect many areas including education. Much historical work has ensued, in both the recording and writing down of colonial history and of Māori customary and ancestral law (much of which was hitherto oral, or as constructed or interpreted by Pākehā [non-Māori] missionaries, anthropologists, and historians).

However, the mandate under which the Tribunal was constituted has its limitations. Its time frame was too limited; so in 1985 the task of the Tribunal was extended to cover retrospectively claims to 1840. The Tribunal was constructed basically within a post-colonial framework. It can only make recommendations to the government, who can either delay, ignore, modify, or enable these by enacting them into legislation. Negotiation with the claimants is involved. However, the power including the decisions around the form of compensation is still under the hegemonic control of the dominant culture.

There is increasing dissatisfaction by many concerning this whole process of reparative, distributive, and cultural justice and the associated claims. Some tribes are now making claims directly with the government. Other Māori are arguing that the debate needs to be centred around the Bill of Rights, or the Draft Declaration of the Rights of Indigenous People, or the common law doctrine of aboriginal title, in particular the role of tikanga (Māori law and custom) (Durie, 2003; Law Commission, 2001). Questions are being asked as to whether a process that, since 1985, concentrates on the concerns of the past is the best way forward. This in turn raises issues around the place of the Treaty itself in contemporary life and for future

directions, which Graham Smith (1997) characterises as 'a crisis of legitimisation with respect to the Treaty of Waitangi' (p. 285).

Principles of the Treaty

Currently, many refer to the 'spirit' or 'intent' of the Treaty. Besides implying a critical judgement on the limitations of the original document (including a tortured hermeneutical process), this position arises from a desire to relate the Treaty to the contemporary situation. This approach is also applicable to the so-called 'principles' of the Treaty, which are enacted both in governmental regulations (since 1986), and in organisations including the 1992 revised Constitution of the Anglican Church.

Nevertheless, what is meant by the 'principles of the Treaty'? The government has here abrogated its responsibility and given room to a range of authorities to define what could be meant in particular locii. Contemporary interpreters are following the hermeneutical tenet of not being confined to the original (1840) context, nor to a literal and limiting analysis of words, nor to forcing the document into a legalistic straight-jacket (Te Puni Kōkiri, 2001).

However, the subsequent vagueness, disparity and ambiguity of interpretations (as reflected in legislation, jurisprudence and real life) raise the question whether both the 'spirit' and the 'principles' are useful and definitive concepts on which to base legislation and policy, including educational theory and practice.

Partnership

It is clear that the Waitangi Tribunal in the 1980s was seeing partnership exercised with the utmost good faith as *a*, if not *the*, fundamental provision of the Treaty. Even though the Anglican Report of 1986, referring back to a Discussion Document of 1984, suggested that the Treaty derived principles of partnership and bi-cultural development promoted in the latter document were seen then as 'tentative', that Church adopted these two principles as foundational for the future life of that church (Anglican Church, 1986). Judge Eddie Durie, until recently chair of the Waitangi Tribunal, attributed the concept of partnership to a Māori bishop of the Anglican Church, Manu Bennett. This concept was adopted subsequently by the government and the Court of Appeal (Durie, 1988). However, what the term 'partnership' means precisely in all these circumstances is open to some debate. Yet most Māori and liberal Pākehā commentators hold on to this as basic: namely that the Treaty is primarily concerned about the partnership between two sovereign peoples, the Pākehā and Māori. This tenet applies to all areas of society, including education.

Biculturalism

The principle of partnership, two peoples forming one nation, led to the principle of biculturalism. This was the product of an evolving reaction to the dominant monocultural (Pākehā) society. The promoting of the principle was the defining

moment for Māori, being seen as the way forward in order to come to terms with what it meant to be Māori, and for Pākehā, what it meant to live constructively with the indigenous people.

It was a time when cultural deprivation theories and deficit theories (victim blaming theories) were prevalent. ...Biculturalism was targeted at all New Zealanders and aimed to develop rudimentary understandings and practices of Maori culture within all New Zealand citizens – the outcome was to be citizens who were able to stand comfortably in two cultures (Smith, 1997, p. 386).

In 1984, for example, educational practices were instigated in order to educate children of both peoples within the school system in Māori tikanga (culture) and language, and to address the under-achievement of Māori children along with the ignorance of the Pākehā. However, the system was still Pākehā, and although it did improve the knowledge of that group of students, it was deemed a failure by most Māori as it failed to equip Māori to live as Māori in a Pākehā dominated society. This manifestation of biculturalism is a form of assimilation or acculturation where Māori cultural practices become tacked on to the dominant existing culture. This becomes little more than a form of hegemony and denial of sovereignty, and in effect encourages disempowerment and dispossession. Policies and approaches that attempt to rectify injustices are subsumed under Pākehā polity, with Māori as the disadvantaged minority.

From another perspective, biculturalism can recognise two peoples, one as tangata whenua, (the indigenous people of the land), and the other as manuhiri (guest), and with the former being guaranteed 'some autonomy and residual sovereignty' (Durie, 1993, p. 24), yet working together in partnership for the greater good of all.

There is considerable debate within cultural politics concerning the applicability and relevance of the term biculturalism in modern New Zealand (Durie, 1993; Kelsey, 1996; Fleras & Spoonley, 1999). As a government and church logistic, biculturalism was meant to address the philosophical, economic, social, and political needs of Māori. As understood within the Treaty hermeneutic, biculturalism accorded Māori a special status. At a structural level, it can mean anything from 'cultural awareness in the workforce to the promotion of autonomous Māori institutions for the expression of tino rangatiratanga [sovereignty]' (Fleras & Spoonley, p. 238). The term can be placed on a continuum of goals, structures, and policy outcomes, from a 'soft' to a moderate, to an inclusive, to a strong and finally to a 'hard' position; from an unmodified mainstream institution, to an attempt to introduce an increasing Māori protocol and component within the existing structure, to a partnership with active Māori involvement, to an independent but parallel Māori institute, and finally to a completely independent Māori institution.

The semantic usage of this term is summarised in Table 1, 'Forms of Biculturalism', developed from those of Durie (1993; 1995), Fleras & Spoonley (1999), Smith (1997), Smith, Smith & McNaughton (1999), and Cunningham (1999). A non-bicultural column 'denial' is included in order to complete the picture. It should also be noted that where 'monocultural' is read some would accept 'multicultural'

Table 1. Forms of biculturalism

Models	denial deficit model	'soft'; appeasement model	moderate; cultural model	inclusive; structural model	strong; diversity model	'hard'; separation model
Goals	conformity to pakeha culture, denying place of Māori culture	celebrating Māori culture language and tradition within society	improving race relations	partnership within institutions	separate but equal	Māori self determination, tino rangatiranga; challenging; the system; centres of resistance
Structures	status quo; western and 'colonial'	removal of discriminatory barriers and prejudice	a Māori perspective into the culture of an institution	active Māori involvement within the central mission of an institution	parallel institutions both committed to the same overall aims	Māori models of self-determination

Policy outcomes	retaining status quo; absorption; acculturation	incorporating Māori, mainstreaming; assimilation	accommodation; integration	responsiveness to the other; inclusivity; partnership	devolution of power, resources, and outcomes; self management; parallelism	autonomous institutions; self-determination
Treaty of Waitangi	historical; nullity or fraud irrelevant	Māori invited into colonial framework; cession	paternalistic parts to be honoured	partnership, as one people adaptable	partnership, but parallel; principles	essential for restorative justice; but indigenous rights way forward; spirit

in some instances. This is indeed either a reaction to, or a denial of, biculturalism, arguing that the ethnic mix of New Zealand society is now multicultural. Others impose a monocultural understanding that says all must conform to the norms inherited and developed from the nineteenth century colonial heritage.

There is also a cry from a few radical Māori to take this understanding further by proposing two separate, sovereign, political and geographical nations, with each having its own homeland. However, the solutions need to be realistic. The extreme positions on either side do not address the issues arising from the past, nor do they provide the way forward.

Rethinking Biculturalism

Some theorists, both Māori and Pākehā, argue that the term 'bicultural' is not at all helpful as a way forward for contemporary society, because the term is so loosely defined, because it means different things to different people, because it has an inherent dualistic language and assumptions leading to an adversarial polarity, and because its analysis of society is basically ethnic and racial and thus ignores other categories such as gender, class, economic disparities, and political orientation. Bicultural rhetoric is reactive to the assimilationist, integrationist agendas arising from colonial understandings, and the consequent acculturation of Māori. The term is locked into a particular era with all of its issues (such as finding an identity for Māori and righting the injustices of society). The solution was seen partly in a revisitation of the significance of the Treaty of Waitangi along with the particular interpretative scenario of partnership that acknowledges 'not only difference but also affinity' (Meredith, 1999, p. 305).

Post-Colonial Discourse

A way forward is to invoke post-colonial discourse. Sugirtharajah (2001) in his survey of post-colonial discourse suggests that there are three interactive streams or fields.

The first 'carries the notion of invasion and control' (p. 248). This stream exposes the discourse of the colonial as one of domination, control and of hegemony. Consequently there is the demand by the colonised for emancipation at various levels from the domination of and suppression by the invader. Much of the rhetoric in the middle of the twentieth century within New Zealand was driven by this social location. Two unequal entities were fighting for space, one seeking to impose, the other seeking liberation for their own souls and cultural identities. As Sugirtharajah points out, much of the language and imagery for the discourse and the epistemological assumptions were provided by the occupier. The Treaty in both its English and Māori versions fits into this mould.

The second stream concentrates 'on recovering the 'cultural soul' from the intellectual and cultural grip of the master.' Two approaches are utilised. The first is the attempt to recover the essence of the indigenous culture, including

revival of its language. The other approach is to expose the hegemony of the master, his wiles and any discourse that belittles the other party. Smith (1997) admits that the struggle by Māori demands working at an essentialist level with its positions of identity based on ethnicity and its conceptualisation of an indigenous culture and identity. This ethnicism is one of the weaknesses of this approach, especially when it thrives on the polarising categories of much of the bicultural discourse.

The third stream 'stresses mutual interdependence and transformation'. The emphasis 'is on the construction of an identity based on the intertwined histories of the coloniser and the colonised' (Sugirtharajah, 2001, p. 249). In New Zealand, two recent critics can be placed in this stream, Rata and Meredith.

Meredith, utilising the post-colonial cultural discourse of Homi K. Bhabha (2004), especially the concepts of hybridity, liminality and Third Space, argues that there needs to be more inclusivity rather than exclusivity, and a more multi-faceted rather than dualistic pattern of 'cultural exchange and maturation'. The mutual and mutable space between the coloniser and the colonised 'initiates new signs of identity, and innovative sites of collaboration and contestation' (Bhabha, as cited in Meredith, 1999). This 'Third Space' does not arise from any attempt at assimilation, integration or a binary partnership, but 'emerges from an analytical scrutiny of diverse cultures ...and lays weighty emphasis on critical exchanges and mutual transformation between the two' (Sugirtharajah, 2001, pp. 249–250).

Rata (2000; 2001; 2003) analyses the chronological shifts that have occurred in New Zealand with respect to the issue of biculturalism within the wider context of global capitalism. The early understanding of biculturalism in her opinion was one of cultural recognition and inclusion, and is well articulated in the phrase 'one nation, two peoples'. Then there was a response that focussed on ethnic identity, both what it meant to be the indigene (Māori), and also in opposition referent to this, what it meant to be Pākehā. This 'bi-ethnicism' became politicised in the mid 1980's with the government-Māori (tribal) partnership becoming the interpreting rhetoric. The principles of the Treaty (and the spirit) replace the provisions of the Treaty. Within a decade, nevertheless, 'biculturalism had been replaced as a societal ideal by retribalisation on the Maori side, and an 'embourgeoisement' and class closure by many of the Pakeha new professional class' (Rata, 2000, p. 172), leading to neotribalism of Māori. Rata argues that there is confusion between ethnic identity and culture. If the two are identified, then this increases the bifurcation, based on genetic grounds, of society. However, if distinct, then there is room for creating a future that is not predicated on ethnic definitions and boundaries. This is reinforced by the arrival of recent migrant groups that supports her claim for that middle space to create 'a national 'kiwi' identity.' This could be identified as the 'Third Space'.

In both the approaches of Meredith and Rata, the future lies not in the Treaty of Waitangi (still needed to address the inherited injustices such as the confiscations of land in the 1860's), but in building on and incorporating the cultures of the ethnic groups which now reside in this land. Meredith and Rata are not alone in questioning the strict biculturalism arising out of a 'politically correct' interpretation

of the Treaty, which forms much of debate and policy not only in education, but also in the working of contemporary society. Much of current educational (including theological) ideology works out of either the 'inclusive' or 'strong' forms of biculturalism.

Education

As an integral part of this historical turmoil and interpretation, education took a key place. Questions raised included: What kind of education? Who determined the curriculum? The pedagogy? The research models? How do all these questions explicate what is meant by partnership and biculturalism under the Treaty of Waitangi? (See Table 2). Two models in particular reveal both the tensions and possibilities in the context of theological education.

Kaupapa Māori

Illustrative of Sugirtharajah's second stream is the Māori specific educational institutions from pre-school to tertiary levels, which deliver a uniquely Māori derived education, which stands apart from, and sometimes in resistance to, the state derived (first stream) educational system. The whole movement is termed Kaupapa Māori, and arises from within Māori philosophy, world-view and cultural principles and is being extended into social policy and jurisprudence. (e.g. Henry, 2000; Law Commission, 2001; Smith, 1997; 2003; Smith, Fitzsimons, & Roderick, 1998; Tau, Ormsby, Manthei & Potiki, 2003). It may be summarised succinctly as 'by Māori, for Māori, about Māori' (Bevan-Brown, 1999). Graham Smith (1997; 2003) and L. Smith (1999) are at great pains to stress that this movement is not only a praxis-focussed movement; it also develops a kaupapa Māori critical theory to align with and underpin the praxis. Although much of this theory is developed from within Māori tikanga with its own knowledge and pedagogy, it is also informed by critical theory from the wider world, in particular Freire (Smith, 1997; 1999) and Gramsci (1994). G. Smith makes considerable use of Freire's model for making people more fully human through entering into the cycle of conscientiousness, resistance and transformative action. He takes this further and argues that these are not in an instrumentalist, lineal progression, with one being prerequisite or contingent on the other as in Western thinking. Rather, they are cyclical and dynamic, and can be held simultaneously. All are important, but individuals or groups may enter the cyclical process of struggle at any point. This is reinforced by the experience of Māori. Significant is Freire's emphasis on the relationship between praxis, language, experience, power, identity, social location, along with education being an 'active agent of social change' (McLaren, 1996, p. 125).

The Treaty of Waitangi plays a significant role in giving permission to develop Māori's own taonga, unique gifts and insights. It has allowed the 'space' in which Māori might grow and explore their own identity and role in the bicultural context of Aotearoa and New Zealand, and indeed in the global world. The guidelines

Table 2. Forms of biculturalism with in education

Models	denial deficit model	'soft'; appeasement model	moderate; cultural model	inclusive; structural model	strong; diversity model	'hard'; separation model
Educational outcomes	monocultural educational system	monocultural with a Māori tangential overlay	te taha Māori, add on into existing system	bilingual units and wānanga within schools and institutions	kura kaupapa Māori and wānanga alongside parallel monocultural	kohanga reo movement
Theological Education	western and monocultural	include some Māori custom	taking seriously Māori custom and courses	working in tandem within the same institution; St John's College; School of Theology	Tāpapa (Anglican)	(traditional) wānanga
Research methodology	not recognizing Māori as participants or subjects, and no specific impact on Māori	Māori as subjects; benefits for society, or needs base restitution	Māori as subjects and as junior members of research teams;	Māori as significant participants; alongside mainstream standards; produces Māori knowledge and benefits	research team predominantly Māori; approach, methods, expectations and standards are Māori; but some accountability on use of public funds	research team exclusively Māori; approach, methods, expectations, and standards are Māori; resourced by own funds

produced by Tau, Ormsby, Manthei and Potiki (2003) offer practical suggestions for Pākehā and Māori working together as 'Treaty partners'. This is reflected in structure, environment, content, kawa (custom) curriculum and delivery (pedagogy). In all these areas, space needs to be created. However, they are critical of some Māori theorists who would argue that traditional Māori knowledge (mātauranga) is a knowledge system that needs to be taught along with contemporary realist-objective worldviews. They argue that 'mātauranga Māori is a belief system, rather than a knowledge system' (Tau et al., p. 15), and more suited to the 'seminary' rather than the University. This system is not congruent with a modern knowledge world. Its 'primary purpose is to act as a social bonding agent, rather than to offer an explanatory theory that better represents what occurs in nature' (Tau et al., p. 18). As a cultural construct it still deserves preservation and study, on the understanding that Māori as 'the Treaty Partner is the legitimate representative of Māori knowledge and belief systems' (Tau et al., p. 55). Others have argued that the Euro-centric nature of Western knowledge systems and the research paradigms utilised have all undermined Māori and all indigenous cultures and that Māori along with indigenous cultures need to reclaim control over indigenous ways of knowing and research (e.g. Bishop, 1996; L. Smith, 1999). Mason Durie says succinctly that the only role for the state is a 'facilitatory' one. He continues, 'Māori leaders have insisted that Māori knowledge, and Māori heritage generally, belong to Māori and must form the seed from which positive Māori development can grow' (Durie, 1998, p. 79). The issue, significant for educational philosophy and theological education, is whether this development can be done in the contemporary world in a 'space' which will lead to mutual advancement and interaction, or whether the 'space' will lead to divisionary and firm boundaries that make it increasingly difficult to live and advance together.

Anglican Theological Education

The Anglican Church in New Zealand has been involved in education since the early nineteenth century. St. John's College was founded in 1843 'as a place of religious and useful education for all classes of the community, and especially for Candidates for Holy Orders' (Selwyn, as cited in Tucker, 1879, I, p. 135). It was to supply the needs of both Māori and the settlers, and also to resource the peoples of the southern Pacific. Independent of the College, the Church further fostered education among children by setting up a series of boarding schools meant for Māori and encouraging Māori culture. These have often been criticised for being too Pākehā, with a Māori veneer.

The approaches developed specifically within current theological education evolved as the Church reviewed rigorously over several years the significance of the Treaty of Waitangi not just for society as a whole but also for its life and constitution. In 1984, a Commission was constituted by the Anglican Church to examine the implications of the Treaty for the Church. The principles of partnership and

bicultural development derived from the Treaty became entrenched in its constitution and fostered a diversity of approaches to theological education.

Te Rūnanga o Te Pīhopatanga o Aotearoa (The Council of the Bishopric of Aotearoa) in its submission to the Commission stated:

The Council asks the Commission to set out clearly for the Church an understanding of the concepts of tangata whenua and manuhiri, so as to overcome the problems associated with the treatment of Maori as manuhiri, or honoured guests, in a Church which was Maori in the beginning in Aotearoa (Anglican Church, 1986, Appendix C).

In 1992, the Anglican Church restructured itself uniquely into a system and with a polity that implemented three equal Tikanga/cultural streams: Maori, Pakeha and Pasefika (Anglican Church, 2001). It melded a bicultural model into a tripartite structure, but one honouring at all times the priority of the indigenous people, the Māori.

This revised Constitution of the Church means that Anglicans

- are covenanted to implement the principle of partnership between Tikanga Māori, Tikanga Pākehā and Tikanga Pasefika, and also the principle of bicultural development.
- are required to relate to each other as equals.
- participate in a common life that is an expression of partnership.
- are empowered to carry on its mission within the respective Tikanga and the structures each Tikanga adopts, as well as in the common life (Anglican Church, 2001).

The new Constitution is described by Bishop Muru Walters (2002) as one that 'recognises the need to redeem the Church's unjust treatment of Maori over many years. This redemptive theological model enables the Church to say sorry, seek forgiveness and reconciliation for its historical injustice to Māori'.

Although the Constitution itself does not stress the significance of the Treaty, its supportive and subsequent documents and discussion do. Examination of these suggests that the isolation of the two principles partnership and bicultural development owes more to the accepted thinking and rhetoric of the 1970s and 1980s than to a theological perspective. Even though these principles are declared to be 'consistent with the Gospel of Jesus Christ' (Anglican Church, 1986, p. 25) this is not developed. Key theological principles such as equity, justice, forgiveness and reconciliation, which would be a more constructive way forward, are virtually ignored. More theological integrity would explore the theological principles listed above as well as others such as unity in Christ, creation of humanity under God, whilst still addressing the issues of brokenness, injustice, and racialism. The Anglican Constitution should not be fossilised in the rhetoric of the 1980s. The criticisms of those such as Rata and Meredith are just as applicable to the thinking of the church as to society as a whole.

The Anglican Constitution has been interpreted (in ways that parallel what is occurring in New Zealand society) by some Māori and Pākehā as allowing bicultural development; both groups were able to work independently in a prescribed direction for themselves without interference from the other, especially any hegemony on the part of Pākehā (Second Stream). Others interpret bicultural development as both Māori and Pākehā engaged together, enabling each other's development, but in partnership, within the same location, thus creating something unique to the New Zealand Anglican context (Third Stream). The Pacific tikanga complicates the whole matter.

Whichever approach was taken (see Table 2), institutions and structures that had in effect been paternalistic, Western, and basically monocultural, have had to explore the implications of the Constitution for themselves. Each tikanga was free to explore its own expression of ministry and ministry training (Te Paa, 2000).

Differing Approaches within Tikanga Māori

For Tikanga Māori, both stances are reflected in education at all levels, although limited resources hinder their full development. In theological education, Tikanga Māori explored for themselves what forms of ministry were needed, and what kind of training would best serve those forms. Under the banner of Te Whare Wānanga o te Pīhopatanga o Aotearoa (The House of Learning of the Bishopric of Aotearoa), two main directions were developed in Theological Education. The first led to the founding of the Tāpapa. This arose from the desirability that Māori have a choice of options that met their requirements, including the development of a theology and the practice of ministry to speak out and into context, and the necessity to design a researched based curriculum that is clearly Māori in pedagogy, content, and outcomes. The Tāpapa is an association of Māori Colleges that offers qualifications, not only in theology, but also in other aspects of life. Its offerings include a considerable number of short courses, as well as degree courses up to Master's level.

The courses of study cover theology, ministry, pastoral care and iwi-hapu (tribal) studies with a Christian and a tikanga Māori base. Structurally this approach is similar to that of the Kaupapa Māori movement described above. It has similar strengths, and is subject to similar affirmations and criticisms. It too speaks out of a Freirean analysis of society and of pedagogy. In its curriculum, although it is informed by traditional Māori philosophy, world-view and cultural principles, there is still a strong traditional Christian base and focus although expressed through a Freirean lens. Some traditional Pākehā members of the Church, working under the mis-apprehension that there is universality in theology and a fixed received tradition, utilise the word syncretism for this approach. This term does not encourage dialogue or any working together; nor does it address the complexity of the inter-relationship of tradition, location, and trans-culturality. There is a dialectical relationship between tradition and culture. The Tāpapa movement is addressing

the needs of the Māori members of the Church, and it finds its truth, validation, authentication, and accountability in its community.

St. John's College and the School of Theology, the University of Auckland

The other significant approach to theological education is at work at St John's College, which has been the Church's primary residential theological educational site since 1843. It is currently linked with the University of Auckland, through the School of Theology. This is a partnership with the University and four Church Colleges, Trinity Methodist, Carey Baptist, Catholic Institute of Theology (lay training), and the Anglican St John's College. The School of Theology provides the academic curriculum for all these Colleges. The issues around bicultural theological education have given rise to much discussion over ecumenical boundaries. The result is a new curriculum inaugurated in 2006 in which the Western inherited paradigms of theological education are challenged. The School is committed to 'the provision of bicultural education expressive of the partnership with Māori in Aotearoa/New Zealand which derives from the Treaty of Waitangi' (School of Theology, 2002, p. 1). If one accepts the centrality of the Treaty, any biculturally based education, including theological, needs to honour the Treaty and the associated hermeneutic. This applies to curriculum, pedagogy, structures, and decision making processes 'which reflect the responsibilities and obligations under the Treaty of Waitangi' and which honour Māori as the indigenous people of the land.

As far as St John's is concerned, this College has evolved, as a result of the Constitution, from having a basically mono-cultural ethos to a three-tikanga on-going enterprise, in which each member college identifies personally with a tikanga, and yet each one of them is an integral part of the whole.

Three colleges were constituted reflecting the tikanga nature of the Church, all under the banner of St John's College: Te Rau Kahikatea (1991), College of the Diocese of Polynesia (1998), and, in 1991, the College of the Southern Cross (Pākehā). The Heads of the three Colleges have an equivalent role with respect to their individual college, and as Heads, they act as a triumvirate (Te Paa, 2001). As the result of a recent report on the future of the College (College of St. John the Evangelist, 2004) the Board of the College in March 2005 decided that there should be one overall head of St John's College, who would support the three heads of the individual colleges as *primus inter pares*. This change appears partly in response to the perceived need of a managerial model in order to expedite development, rather than the slower consensus model represented by the preceding situation. However, at the subsequent meeting of the Board in June, 2005, this decision was overturned, mainly because of fears that the voices of the marginalised, namely Māori and Polynesian, might in turn be silenced by the numerically and historically dominant Pākehā.

St John's College is declared by the Church to be 'a site of excellence in theological scholarship and leadership, cultural aspect and spiritual inspiration'

(Anglican Church, 1998, p. 44). The Mission Statement of the College states that the educational purpose is to provide 'quality bicultural theological education in the context of New Zealand and Polynesia' (College of St. John the Evangelist, 2005). Three publics need to be addressed in a theological institution: society, academy and the Church as the people of God. In developing an ethos, a direction, and a curriculum, a number of key questions have been, and continue to be, debated.

What are the Integrating Principles in this Institution?

Integration acknowledges different voices and identities. Within the present location, the key ones are those based on the three tikanga: Māori, Pākehā and Polynesian. Each tikanga has its own story, which it brings into the common enterprise in order to contribute to the development of a distinctive theology and spirituality for Aotearoa New Zealand and Polynesia. This is done by honouring the distinctive contexts: historical, ecclesial, geographical, cultural; by honouring the received tradition; by engaging with contemporary perspectives; and by ongoing development in partnership. Otherness is to be confronted, diversity respected, and togetherness explored. The principle of partnership is key, a principle, which is central to the Treaty of Waitangi, and one, which is biblically and theologically driven.

Further, the three publics of society, academy and church are integrated through a curriculum in which the discourse of theology is to address all three publics, by a theology which is academically respectable, a message which enables the members of the church to engage with the demands of the gospel, proclaiming its prophetic witness and encouraging social activism for justice and reconciliation.

Which Hermeneutical Principles should be Adopted?

The basis of any hermeneutic is the ability to read and interpret any text or tradition, be it from the past or concurrent with the interpreter. For theological educators the task is to read and re-image the inherited story from within the bicultural context of Aotearoa New Zealand. The social location of the educator drives the hermeneutic. Difference is again acknowledged and the individual hermeneutic, be it kaupapa Māori or Western based, is brought to the partnership context in order that something unique be transformed into Sugirtharajah's Third Stream. A new kaupapa of reciprocity, redemptive justice and conscientisation, resistance and transformative action emerges. This must be post-colonial, bicultural, and appropriately bilingual. The hermeneutic is

...rooted in critical and communal reading of the Bible that seeks to discern the presence of the life-giving God in a suffering world ...It is a reflection on God's transforming action in an increasingly globalised world. It is prophetic and critical, hopeful and life-affirming. It participates in Jesus' solidarity with the marginalised and privileges their voices. It ...fosters engagement and action (Anglican Indigenous Theologians Network, 2003; College of St. John the Evangelist, 2005).

What are the Consequences for Missiology?

The College exists to provide theological education, ministry training and formation that are to advance the mission and ministry of the Church in the locations of Aotearoa New Zealand and Polynesia. It aims to develop Christian leaders as critical thinkers capable of exercising transformative ministry to meet the needs of each tikanga as it seeks to express the gospel in its location and in the world.

The tasks of such leaders include:

1. proclaiming the gospel of Jesus Christ;
2. teaching, baptising and nurturing believers;
3. responding to human needs by loving compassionate service;
4. seeking to transform the unjust structures of society;
5. striving to safeguard the integrity of creation and working to sustain and renew the life of the earth

(This is based on the Anglican Consultative Council's Statement, 1984, [Anglican Consultative Council, 1985] and incorporated into the Constitution of the Church.)

Here the creative tension at St. John's is to respect and honour the particular aspirations and contexts of each tikanga as it works out the implications of these generic statements in different contexts, and yet attempt to educate together in partnership.

What are the Consequences for Pedagogical Principles?

These arise from the emancipatory constructs expressed in the Constitution of the Church, which in turn build on the principles derived from the Bible and from the Treaty of Waitangi. Again, the pedagogical principles of each tikanga are to be honoured and in partnership, something creative and new ensues. For example, the use of oral history and stories is fundamental to Polynesian and Māori education. Kaupapa Māori has developed its own teaching, assessment and research methodologies that arise out of its own culture and principles derived from the Treaty of Waitangi such as partnership, participation, protection and empowerment. Pedagogy needs to develop a critical consciousness that is transformative, praxis based, and addresses the connections between social location, knowledge, authority, power, hegemony, domestication, resistance and justice. The starting point is the individual in context rather than the authoritative expert enforcing specific content based knowledge on to the passive learner.

There is deep commitment both to the transformative values of the gospel and to the Treaty and its principles in the Church and in the College. The faculty in consultation with other educators within the Church are in the process of developing curriculum and papers that will reflect this ethos. All Pākehā teaching staff have committed themselves to a programme of upskilling in Māori language and culture. The College has a policy of developing and appointing teaching staff from the Māori people and from the Pacific. It is currently developing a foundation course

that will pick up issues referred to in the statements and definitions enunciated above, and is exploring the possibility of a new award along the same lines.

Conclusion

An issue which arises in addressing past wrongs, particularly in the context of the Treaty of Waitangi, is that of one-sided 'partnership'. Understood thus (as it has until recently), it is easily absorbed into an assimilationist mode. Both Māori and Pākehā need the space to explore, to define whom they are, and as Christians to envisage a Christ who is relevant to them. This can easily lead to a form of separatism, and a denial of the colonial oppressor in favour of the oppressed finding his or her freedom. Yet, for a partnership to work there needs to be a mutual respect for each other, and a willingness to learn from each other. As part of the one land, all residents can contribute their own story into a distinctive theology and spirituality for Aotearoa New Zealand.

The significance of Treaty based relationships, and the unique place of the indigenous 'people of the land', make multiculturalism of a different order in the context of theological education, whether Christian or not. It has a more sociological focus than biculturalism that is more politically motivated. The needs of all ethnic groups still have to be taken into account when discussing education and forming curriculum.

Theological education can be transformative for people, structures, and cultures. Any transformation in education is not simply a revision of the curriculum in an attempt to meet the needs of differing cultures. There needs to be a transformation of curriculum, pedagogy and the teachers. It is extremely difficult for individuals to decode themselves and to shift paradigms. 'We had not realised how much faculty would need to unlearn racism to learn about colonisation and decolonisation and to fully appreciate the necessity for creating a democratic liberal arts learning experience' (hooks, 1994, pp. 37–38).

Any curriculum revision needs to release the 'cultures of silence'. As Freire constantly reiterates education is *by* or *with*, not *for* the oppressed people who struggle to regain their humanity (Freire, 1983). Education enhances what he calls the 'ontological vocation' of humanity. This is applicable to the individual and to society. The Māori voice had begun to be silenced. It has been released over the past thirty years.

However, the reality of New Zealand society is that although individuals or groups may be able to decode, decolonise and decentre, society as a whole (and the Church in particular) are not always ready to do so. What is important is that 'it is crucial that critical thinkers who want to change our teaching practices talk to one another, collaborate in a discussion that crosses boundaries and creates a space for intervention' (hooks, 1994, p. 129). This is what the challenge is at both St John's College and the School of Theology. It is a slow process. It is hoped that a new and exciting curriculum and pedagogy will develop into a unique 'Third Space', which will give voice to the silent, and which will enable the silent not only to

speak for themselves, but to those who have silenced them. Such a 'Third Space' might transform society and individuals and enable Christians to serve God in the world in which difference is celebrated: and also one commonality in difference.

SECTION THREE

INTRODUCTION TO SECTION THREE: CONVERSATIONS ABOUT RELIGIOUS EDUCATION

Kathleen Engebretson

Australian Catholic University, Melbourne, Australia

Theory in Religious Education

The word ‘theory’ is used to designate the self understanding of a discipline, an ‘explanation of the principles underlying its practice’ (Burgess, 1996, p. 15). It is the response given to the questions: ‘What is this discipline about? What is its nature and purpose?’ Confusion about theory within a discipline, or perhaps, more exactly, confusion about the particular branch of theory to which one adheres, necessarily leads to confusion of intention in teaching, to confusion in teaching practice, and finally to confused students. Wyckoff (1959) summarises the principle succinctly:

Consistency in the relationship between theory and practice is absolutely indispensable for the effectiveness, expansiveness, and fruitfulness of a practice in any domain whatsoever.

I find it helpful to characterise the wide ranging field of theory about religious education as a series of ongoing and at times overlapping conversations (Foster, 2003), each most meaningful within its own context, be this educational, ecclesial or societal. Within these conversations theory is made and re-made, the conversations drawing on the known, the familiar, the established, to forge new understandings and new knowledge as the world becomes more complex and plural. In this section of the *International Handbook of the Religious, Spiritual and Moral Dimensions of Education* five conversations are represented which often flow into each other, but which are distinguishable by the context within which the conversation takes place, by the issues that they represent and, to a large extent, by the people and institutions that conduct them. For the sake of mapping the conversations throughout this section of the Handbook, I would like to broadly characterise them as 1) philosophical, theological and ecclesial conversations; 2) phenomenological

conversations; 3) conversations concerning the interface between religious, spiritual and moral education; 4) conversations about the educational nature of religious education; and 5) conversations about religious education beyond the school. These are simply labels, but while they are inadequate descriptions of the discourses whose richness becomes apparent as the section unfolds, they provide a convenient classification within which to map the field of theory in religious education.

Philosophical, Theological and Ecclesial Conversations

Philosophical Issues that Concern Religious Education

The six contributors to the first part of this section converse about the philosophical, theological and ecclesial dimensions of religious education. The first chapter by William Kay is a fitting introduction to the field, for it raises central issues about the nature of religious education in particular contexts. Kay begins with an analysis of the generic philosophical problems raised by teaching religion, and is concerned with the effectiveness of the answers that have been given by representative writers. He shows how religious and secular theorists formulated their contributions to religious education, while recognising that political and cultural conditions stand behind the expression and motivations of these approaches. Kay's conclusion is that while religious education may be a vehicle for the transmission of the beliefs of a religious tradition, it can also address the pressing issues of the time, thus contributing to the development of an improved global community.

Nipkow takes up this conversation, again providing a wide-ranging discussion, which identifies and analyses issues that surround the theory and practice of religious education across Europe. Like Kay, he is aware of the tensions between the individual and community aspects of religions and how these interplay in societies. The complexities of religious education practice within these sometimes competing, yet interrelated, pressures are discussed within the framework of contemporary European education, and against the background of Protestant history.

Nipkow's insight is that learning is 'self-formation', dependent on encounter and interaction with tradition from the past, challenge in the present, and vision for the future. Like Kay he rejects indoctrinatory theories of religious education yet allows the role of religious traditions in both handing on and interpreting their particular cultures. He rejects an over-emphasis on the development of personal faith in order to emphasise education through diversity. An educational and hermeneutical methodology, which recognises the truthfulness of existing world religions in their specific identity, is called for (Nipkow, 1998).

Hull's chapter, *Religion, Violence and Religious Education*, models the point made specifically by Kay and implicitly by Nipkow, that religious education, while faithfully interpreting religious traditions, and educating in their own emphases and culture, can and must make a difference to the world. He examines the historical links between religions and violence, notes the close relationship between violence and exclusivist religion, and calls for this to be countered in religious education

through an 'anti-religionist' religious education, which would be comparable to the anti-racist and anti-sexist movements in education of recent years. This would challenge educators to consider the appropriateness of single faith as opposed to multi-faith groups, open rather than closed approaches to content, examination of a range of religions rather than one, and the interplay between religious education and responsible citizenship. In exposing the links between violence and religions, and devising ways that religious education can contribute to peace, Hull illustrates that religious education has a social and global function that goes far beyond a transmission model.

Theological and Ecclesial Theories of Religious Education

Burgess (1996; see also Seymour and Miller, 1990; Boys, 1989; Moore, 1991) has classified the field of theological and ecclesial theories of religious education, proposing five models, to peruse the theorists who have contributed to the conversation about religious education as ecclesial and theological. The first of these he calls the *historic prototype*, which prevailed throughout the first nineteen centuries of Christianity, and whose function was initiation and socialisation into the Church. Burgess points out that the writers, teachers, philosophers of this theory were some of the great names of Christian history. They included Clement of Alexandria (150–215), Origen (182–254), Cyril of Jerusalem (210–386), Augustine of Hippo (354–430), Benedict of Nursia (480–543), Thomas Aquinas (1225–1274), Martin Luther (1483–1546), John Calvin (1509–1564), Ignatius of Loyola (1491–1556), John Comenius (1592–1670), John Wesley (1703–1791) and John Henry Cardinal Newman (1801–1890). The similarity of world-view of the prevailing thinkers and educators of this long period meant that religious education was exclusively concerned with the communication of revealed truth. Essentially this historic prototype is found within the documents about religious education of the Roman Catholic Church. Addressed mostly to bishops, they are concerned with schools only in limited ways, and in this section of the Handbook. Fleming points out the problems about assumptions and language that can occur when they are used to provide theoretical norms in schools. He finds that, embedded in Church documents, is the assumption of a religious socialisation function for religious education, and, arguing that schools are far more than agents of socialisation, he calls for a broader and more complex theory of religious education within the Catholic school. Moreover, Fleming finds a certain lack of consistency in the use of language about religious education in these documents, a lack of consistency that can indicate confusion in theory. Educators who look to these documents as primary sources, Fleming argues, often find it difficult to arrive at a precise meaning for 'religious education'.

As the twentieth century began, the historic prototypal theory gave way to what Burgess terms the *classical liberal model of religious education*, a theory that grew from the 'optimistic, classical liberalism that shaped the religious education scene' (1996, p. 76) during the first decades of the twentieth century. This theory

gave primary attention to the functioning of individuals within society, and thus was scientific and practical rather than concerned with communicating salvific truth. In the company of educational philosophers such as Pestalozzi (1746–1827), Froebel (1782–1853, 1905), Bushnell (1802–1876, 1967) and Dewey (1859–1952, 1916) such religious education theorists as Coe (1917), Fahs (1952), Bower (1925), Case (1924), Betts (1912, 1919, & 1925), Athearn (1920) and Chave (1947) developed a theory of religious education that saw it as a process, rather than the seeking of a product, and that attended to analysis of current social issues in order to hear the direction to be taken in Christian response. English's chapter in this section of the Handbook is an excellent illustration of this model. He argues that the 'conservative or reproductive hermeneutic' that is still often favoured by religious institutions, and is spelled out in the documents of the Catholic Church, is at odds with the critical hermeneutic that *de facto* exists in schools, and that much more readily educates for change. Drawing on Newman (1845), English argues that religious education is the process that allows the development of doctrine in the Church, a process that is as valid because it belongs to the People of God as the deliberations of the Church hierarchy. It goes beyond the perceived necessity to communicate revealed truth, to a critical reflection on faith and culture that will contribute to the understanding of the whole People of God about what Christian belief and practice mean. The tradition is therefore preserved by constant interpretation.

In her chapter Hunt looks to the larger arena of education, and declares that all education is essentially religious, even if its religious character is not always explicit. Her argument is theological and is based on an understanding of the term 'religious' that refers to the human capacity for the sacred, and on an understanding of education as the acquiring of a wisdom which permeates the person's whole life. Human beings' capacity and drive to know, reason and understand, a capacity and drive that is manifested in commitment to a search for truth, is, she argues, a religious capacity and drive. When education is at its best, going beyond an outcomes or training preoccupation, this religious capacity is nurtured, and so education is a religious endeavour.

Phenomenological Conversations

The two chapters within this conversation deal with the phenomenological theory of religious education. The 'religious studies movement' which introduced a phenomenological theory of religious education to the world, expanded theory in religious education beyond the domination of the Christian tradition, giving it an inter-faith dimension. The genesis of this was the Butler Act of 1944 in England, which made religious education compulsory in all county schools, and led to intense reflection on the nature of religious education in a pluralistic society. The history of this reflection through the agreed syllabuses, and their gradual adaptation of the phenomenological theory of religious education, is documented in its historical, philosophical and sociological aspects by Engebretson. Her chapter on phenomenology examines its history and context, outlines its methodological

principles, shows this methodology in practice and critiques contemporary debates about this theory of religious education.

The phenomenological theory of the study of religion has been extremely influential in Britain, Europe and Australia, where it has presented a non-judgmental way of studying religions as phenomena of human existence, and thus of contributing to greater understanding and tolerance of the religious groups within a local community. The British scholar, Grimmitt (1973; 1983; 1987; 1991; 2000), argued for greater attention to the purpose of religion, which is related to the search for meaning, and his work has helped teachers to use religious phenomena to encourage students to explore ultimate questions. The overview of Grimmitt's theory of religious education is again presented by Engebretson in its historical, philosophical and sociological aspects, and his socially constructivist theory of religious education, drawing as it does on phenomenology, is shown in practice. The two chapters in this section of the Handbook that deal with phenomenology of religion propose theoretical approaches to religious education for the multi-faith world.

Conversations Concerning the Interface Between Religious, Spiritual and Moral Education

A great deal of theorising about religious education has arisen in response to secularisation, and the three authors who contribute to this conversation all respond to this phenomenon, albeit from different religious and geographical contexts. In a world influenced by the demise in authority of many religious traditions, spirituality and faith are no longer controlled and exclusively mediated by religious traditions. Paradoxically, many argue, this has led to a kind of re-birth of spirituality, which is expressed in many new and diverse ways. 'Post modern societies ...are characterised not by irreligion and disbelief, but by a rise in spiritualities not controlled by religious organisations, spiritualities beyond the scope of churches, mosques, temples and synagogues' (Bouma, 2000, p. 6). Hervieu-Leger (2000) sees value in the rise of the secular society and the resulting decline in formal religion, which, he argues, brings the possibility of reform and re-vivification to religious and spiritual thought. Certainly the post-modern diminishment of the authority of the 'package' of beliefs and practices offered by religious traditions has led to an eclectic construction of spiritual systems on the part of young people who may gather elements from a range of traditions to form a framework of meaning. In this vein, the Australian scholar, Rossiter, shows how the whole curriculum in the school can educate for the spiritual and moral dimensions of education that are no longer simply subsumed in the curriculum area of religious education, and also are no longer the exclusive domain of Churches. This may be done, he claims, through attention to the constructs of meaning, identity and spirituality. The constructs are described, and proposals for ways in which they may be addressed across the curriculum are given.

Blumberg's chapter, from the geographical context of the United States, and the religious context of liberal Judaism, is also set against the background of a

general decline in religious identification and practice. Like religious education in other traditions, the task of the Jewish school in the twenty first century is no longer exclusively perceived as the need to create a synthesis between the beliefs and practices of Judaism and the lives of the students. Recently secularisation has challenged this goal, and Jewish education is confronted with Jewish families whose values do not necessarily cohere with many of the basic assumptions upon which Jewish education is built. Blumberg sets out a new philosophical approach to liberal Jewish religious education, which is based upon the Talmudic injunction of Rabbi Eliezer: 'Know before whom you stand' (Berachot, 28b). In this approach the needs of all—students, parents, the Jewish tradition and institution—are balanced in a way that respects the context of each, allows for a genuine conversation and ensures that the Jewish tradition is brought into dialogue with young people's culture and goals, in ways that have the potential to promote their spiritual and ethical development.

Erriker is also concerned with the relationship between religious education and education for spirituality. He argues that in Britain the management of religious education in public schools by government bodies, the supervisory and inspection roles of these bodies, and the pressure on teachers to see their students conform to pre-ordained outcomes, has killed innovation and adventurous pedagogy in religious education. The culture of supervision and measurement has favoured the cognitive side of the subject but has neglected spiritual education, even though this is the area being given greatest attention currently by theorists and scholars. Erriker surveys the range of theories and pedagogies that have the potential to address spiritual education, and argues that this aspect of a whole religious education needs to be given greater attention, in a conversation between those who manage religious education in public schools and the theorists whose work focuses on education for spirituality.

The phenomenon of secularisation has led to fruitful theorising about the nature of religious education among its theorists and practitioners, and a renewed emphasis on the development of spirituality and morality, informed by a religious tradition or not, has been the result.

Conversations About the Educational Nature of Religious Education

Influenced to some extent by the religious studies movement, there has grown a theory of religious education in the Western world, which, in its adaptation of the religious studies emphasis into a theory which both accommodates particular attention to one religion, and has the potential to nurture religious faith, is particularly suitable for schools sponsored by a religious tradition. The five contributors to this conversation approach it again from varying perspectives and contexts, but emphasise religious education as an educational endeavour. This theory of religious education emphasises the norms of good education, noting that the work of the school is teaching and learning, therefore that attention should be given to providing religious education in the most educationally valid way. This educational approach

to religious education can provide a 'channel to faith through knowledge and understanding' (Rossiter, 1982) in the awareness that the spiritual journey is a life-long one, and that the period of school based religious education is only one influence upon it.

In Australia, Rummery (1975) was one of the first to argue for a systematic approach to teaching religion in an objective way, drawing content from both the home tradition and other religions. Rossiter (1981a; 1981b; 1985; 1988) has consistently argued that the intellectual study of religion is the most appropriate theory of religious education for the religious education classroom, and that this educational emphasis is most likely to meet the cognitive as well as catechetical and spiritual aims of the curriculum. In this section Malone develops this insight, referring to a 'paradigm shift' in religious education theorising. She documents the ways in which the role of the teacher, the learning approaches, the content and student interactions, the life contexts and experiences of teachers and students, have changed over a significant period of time. Malone illustrates the interrelationships between these factors and the extent to which changes to these factors have led to a changing paradigm in religious education.

In an educational theory of religious education the form and quality of teaching/learning resources is paramount, and Buchanan's chapter documents the movement to a prescribed series of textbooks in religious education in a particular Australian context. Embedded in this documentation are many insights about the management of change in religious education, the changes in pedagogy that come with a commitment to good education in religious education, and the particular role that textbooks can play in improving teaching and learning.

Groome's theory of religious education draws on critical education theory, especially that of Habermas (1972; 1974). His *Shared Christian Praxis* theory (1980; 1991), which he describes in the chapter he has contributed to this section of the Handbook, provides a critical and transformative approach to religious education, which brings the story and vision of the Christian community into critique of the present situation. His chapter is a clear theoretical and practical explication of this significant religious education theory, which has been particularly influential in Christian schools. In keeping with the authors of this part of the section, Groome is concerned that religious education be not only a vehicle for transformation, but also that it be excellent education. Crotty's study of leadership in school religious education, set in the Australian context, shares this concern. She finds that in leadership in this curriculum area there are particular tensions and anomalies that arise because of the perceived dual purpose of religious education leadership—that is that it is seen both as an exercise of ministry in a religious tradition and also as educational leadership. The two are not always compatible, and Crotty recommends a variety of measures that may be taken to clarify and differentiate the demands of religious leadership in the school.

Finally, in this part of the third section of the Handbook, Chater analyses the relationships between the personal faith of the religious education teacher and his or her role as a professional educator. He rejects the view that these are

incompatible and to be kept separate, and argues that when religious educators engage critically with the education system, address it from their own contexts and win its 'respectful attention for religious and spiritual realities', they help to change education, and also contribute to developments in the behavior and self-understanding of religions. Therefore, the dialogue benefits the education system, the religion itself and religious educators whose own faith is constantly critically re-assessed through their work.

As Chater argues:

In the contemporary religious world, religious adherents need an educational faith as much as educational systems need their ethical and spiritual presence; and religious and spiritual traditions, in order to survive and accentuate their most positive characteristics, need education as much as it needs them.

Conversations About Religious Education Beyond the School

Most of the contributions in this section of the Handbook assume religious education in the school curriculum, so it is important to hear the voices of those whose concern is with tertiary students and adults. Drawing generally on the theology of Lonergan (1972), Kelly discusses certain terms and categories that are applicable to adult faith development. The concepts of interiority, self-transcendence, conversion, meaning, Word, community, symbol and witness, are explained and woven together into a model that is proposed for adult religious education. Finally, Clifford argues for chaplaincy in universities from historical, theological, and psychological perspectives. While it is unlikely that all students will receive religious education at university, she argues, chaplaincy can provide religious education, and a variety of opportunities for worship and support in moral and faith development for students who desire these.

Conclusion

This introduction to this third section of the *Handbook of the Religious, Spiritual and Moral Dimensions of Education* has grouped the field of theory in religious education according to orientations that arise from particular issues, and in particular contexts. It has classified the various conversations about religious education that are represented in this section as 1) philosophical, theological and ecclesial conversations; 2) phenomenological conversations; 3) conversations concerning the interface between religious, spiritual and moral education; 4) conversations about the educational nature of religious education; and 5) conversations about religious education beyond the school. The first conversation represented in this section of the Handbook illustrates many of the philosophical issues that arise in conversations about religious education as well as the theological and ecclesial orientation often evident in these conversations. The second conversation focuses on phenomenology, a theory that arose in response to the multi-faith nature of world communities.

The third conversation has arisen in response to the issues of secularisation and postmodernism, while the fourth reflects responses to the demands of education on religious education conducted in school settings. The final conversation in the section observes the need for and approaches to religious education beyond the school. None of these conversations is entirely separate from any other, but for the purposes of this section the grouping may assist the reader to make their way through the challenging discussions that follow.

PHILOSOPHICAL APPROACHES TO THE TEACHING OF RELIGION IN SCHOOLS

William K. Kay

Director, Centre for Pentecostal and Charismatic Studies

Introduction

This chapter begins with an analysis of the generic philosophical problems raised by teaching religion (RE), and is concerned with the effectiveness of the answers that were produced by representative writers. It opens with an examination of Ninian Smart's early philosophical work and then considers subsequent developments within the field (in the work of Elmer Thiessen, Thomas Groome, British Humanists, and Andrew Wright) showing how these theorists formulated their contributions to RE, while at the same time recognising that political and cultural conditions stand behind the expression and motivations of their approaches.

Generic Problems

Religions characteristically make truth claims or, if they do not make these claims explicitly, presume them implicitly in relation to their vision of this world or the next. It is the contradictory nature of these truth claims that is problematic, since they either cannot all be true or, alternatively, they can all be true but in a way that is incompatible with other forms of truth claims. If we take a view that the truth claims of religion are similar enough to be placed in one general category then there is an inevitable clash between them either at the historical or at the metaphysical or para-historical levels, or all of these. The contrast between Christianity and Islam is most obviously found at the historical level in relation to claims about the crucifixion of Christ. The New Testament presumes this historical event repeatedly in nearly all the books of the canon. It is a presumption woven into the life of Christianity within its worship, its iconography, its preaching, its doctrine; and

cannot be removed without destroying the identity of the faith. Yet Islam, within its earliest foundation document, casts doubt on the crucifixion (Sura 4.157).

Similar disagreements occur in relation to the monotheistic religions and Indian religions over reincarnation and resurrection. Where there is reincarnation, there is no resurrection; and vice versa. The two concepts are mutually opposed. There is no possibility of teaching that resurrection might be a form of reincarnation or that reincarnation might occur through resurrection. This is because the identity of the individual is conceived in contrasting ways within the two theological schemes. In resurrection, the identity of the individual is retained and memory of pre-resurrection experience is carried forward into the post-resurrection life—at least this is so if Christ himself is seen as paradigmatic. Reincarnation does not make this assumption and, in any event, there are unresolved issues about what features of identity are transferred from one body to the next, or how this can be effected.

Not only are there conflicts of truth claims between religions, there also conflicts of truth claims between most religions and contemporary science. The most obvious ground on which this dispute is fought concerns the origin of the world and its geological age. Many religions believe the universe had a beginning in time and that all species owe their existence to a creator. Although there are differences about the exact claims made by religion in relation to the animal kingdom, most conservative elements within the monotheistic religions claim a special place for human beings. Or, to take another example, the monotheistic religions assert the existence of angels. Gabriel appears both in the New Testament and as the carrier of revelation to Mohammed. Angelic beings have never been subject to scientific scrutiny and are dismissed by contemporary science along with elves, fairies, goblins and leprechauns. Yet, most fundamentally, the dispute between science and religion concerns the existence of God as creator of the entire universe. Science already attempts to provide a comprehensive theory of the origin of the material universe, all life within it and the distribution of species. The Grand Unified Theory (even if not finally formulated) is intended to offer a total explanation of existence without recourse to a transcendent God outside and beyond the universe that is being explained (see <http://www.hep.yorku.ca/yhep/gut.html> or <http://www.grandunifiedtheory.org.il/>).

These conflicting truth claims engender complications for the teaching of world religions in schools. A democratic society made up of different religious groups might agree that it was best for:

- all religions to be taught as if they are true; or
- all religions to be taught as if they are false; or
- only one religion to be taught as if it is true; or
- all religions to be taught as if they make no truth claims; or
- all religions to be taught in a way that recognised the counterclaims of other religions.

The contestability of religious claims, as outlined above, produces specific pedagogic problems. It also introduces the possibility of a much more general

problem in relation to the teaching of religion. This is the accusation that religion inevitably concerns indoctrination, which is, according to Flew's definition, the teaching of doctrines of dubious veracity (Flew, 1972, p. 108; quoted by Theissen, 1993, p. 63). As we shall see, the concept and practice of indoctrination is itself open to debate but, in its simplest form, if indoctrination is said to be the teaching of propositions as if they are true even though they are not true, then religion may be open to the criticism that it is always indoctrinatory. Even if a weaker definition of indoctrination is used and if teaching methods are employed that avoid direct teaching about religious doctrine, it is still possible to make the case that some form of indoctrination is insidiously being perpetrated by the doctrinal implications of religious teaching within the classroom. In other words, pupils may infer that certain doctrines ought to be believed even if these doctrines are not explicitly part of the curriculum.

Smart's Contribution

Smart's early book (1966), *The Teacher and Christian Belief*, addresses many of these generic issues. He was concerned with the connection between Christian belief and the Bible, although his discussion could be applied to any religion that has foundational texts. While his position is dialectical in that he believes any proposition or assertion ought to be challenged by its opposite, he offers a clarificatory four-way system of classification. In respect of biblical authority he argues that it is possible to use the text *deductively* as a network of inter-locking propositions relating to the nature of God and human beings, and from this matrix to deduce beliefs. Alternatively, one can argue for the *inductive* view that provides an account of 'God's concrete historical acts and the testimony to these' (p. 19) and that this approach does not need to be concerned with verbal inspiration or the trappings of particular historical époques. While both deductivism and inductivism have disadvantages, the latter is much more open to scientific discoveries and less committed to fixed and historically indefensible interpretations.

The second polarity concerns *revelationism* and *liberalism*. Revelationism presumes the communication of transcendent truth to human beings without the interposition of contemporary culture or human knowledge, a view defended by Karl Barth (1975, CD, 2, 1, p. 168). Alternatively, a more liberal position is found when revelation is thought to operate in conjunction with naturally derived knowledge. Indeed, in the case of St Thomas Aquinas, a careful distinction is made between the different types of knowledge and the limits of one in relation to the other. This permits the coordination of religious and secular insights so as to produce a harmonious integration where the truths of religion are adapted to contemporary scientific and cultural knowledge.

As table one shows, these two poles can be combined to produce liberal inductivism, revelationist inductivism, liberal deductivism and revelationist deductivism. The point of Smart's analysis is to show how grounds for belief may be differently situated in relation to foundational texts and to demonstrate the plausibility

Table 1. Smart’s analysis of approaches to the biblical text

Approach to foundational text	Truth communicated by revelation	Truth coordinated with natural knowledge
Deductive	Revelationist deductivism	Liberal deductivism
Inductive	Revelationist inductivism	Liberal inductivism

of a position that is flexible in relation to contemporary knowledge. In this way he prepares for a rapprochement between science and religion and between one religion and another, while relativising any conflict between the two.

He goes further than this, though. In a description of the process by which scientific knowledge is achieved, he largely follows the account given by Karl Popper (1989). This account presumes that scientific knowledge operates by positing imaginative theories that are subsequently tested. The process of testing is by verification or falsification and, when these two types of test are compared, falsification is frequently the better approach. Verification stumbles on the difficulty of addressing every single instance covered by a theory within its purview. We may devise a theory about electrons, but can we verify this theory for every single electron in existence? Probably not. Consequently it is better to offer a theory that stands as provisionally true until it is falsified.

Just as a scientific theory explains a wide variety of phenomena, so religious belief provides an explanation for huge numbers of events. The two processes are analogous. Each involves an imaginative leap followed by a testing phase. Yet there are differences between science and religion in relation to the testability of their concepts and the extent to which they rely on observations (Smart, 1966, p. 52). For science, functioning as it does in a material world, confines its conceptions to this world; it cannot test beings like God who are by definition and hypothesis beyond this world. ‘All that is here being affirmed is that the successes of science in no way afford a strong ground for refusing to see another dimension of existence—the transcendent dimension’ (Smart, 1966, p. 53).

Before leaving Smart, one further comment must be made. Ninian Smart’s writings are much more extensive than those of the other contributors. Smart’s work developed after the 1960s into a formulation of religion that divided its aspects into six or seven separate dimensions, only three of which were specifically concerned with truth and therefore with philosophy. Smart’s final position was probably given in the late 1990s (Smart, 1996) in a paper read at a seminar at the North of England Institute for Christian Education in Durham, England, where he argued that ‘no world-view or revelation is susceptible of proof’ and that worldviews assert incompatible theses about the transcendent and ethics. Given the uncertainty caused by agnosticism over truth claims ‘the right posture is soft non-relativism’ (p. 10). Such a position, he argues, would allow the different religions to be seen as having the ability to complement one another. It is a position reached in view of globalisation that, nevertheless, accepts the *right* of each religion to make its own (unverifiable) truth claims.

Elmer Thiessen's Contribution

In a lengthy and thorough book, *Teaching for Commitment*, Thiessen (1993) analyses indoctrination and addresses the accusations that it brings against Christian nurture and, by implication, religious education. For, while the definition of indoctrination may be related to the teaching of doctrines, there are three other criteria by which it may be defined. Indoctrination may be defined by teaching methods, by its consequences or by the intentions of teachers.

Indoctrination may be seen to take place wherever religious doctrines are taught: this is the content criterion. He shows that surprisingly little attention has been focused on the concept of 'doctrines' (Thiessen, 1993, p. 61). Are they uncertain beliefs, false beliefs, beliefs with insufficient or no evidence, beliefs with ambiguous evidence, unfalsifiable beliefs, beliefs held obstinately or beliefs lacking in public agreement? Are they inevitably embedded in systems, always important, central to the heart of an individual, always zealously promoted and necessarily backed by a group or institution (Thiessen, 1993, pp. 61–67)? Examining each of these in turn, Thiessen is able to show that the characteristics contradict each other or are much too vague to be properly useful in a definition. Thus, if doctrines cannot be verified or falsified, then it cannot also be maintained that doctrines involve false beliefs. If religious beliefs are a paradigm case of doctrines, how can one account for the similarity between religious and scientific beliefs, since science contains beliefs that are based on ambiguous evidence that is held passionately and backed by institutions? Indeed, it is the ambiguous evidence for scientific theories that makes the testing of these theories necessary. Moreover, the positivist verification principle was consistently revised to keep metaphysics, aesthetics and theology out and to allow science in. In other words, the goalposts were moved to allow science always to win the verification match.

So far as the method criterion of indoctrination is concerned, non-evidential teaching, the misuse of evidence, perversion of teacher-pupil relationships and the suppression of a critical spirit are all said to be capable of identifying the wrong kind of teaching. But Thiessen shows that it is more or less impossible to provide any teaching, particularly for young children, without methods that could be classified as indoctrinatory on these terms. Wherever there is an authoritative relationship, there is likely to be the traffic of information that would fit into this definition of indoctrination. Even the initiation of pupils into 'public traditions' is indoctrinatory since pupils are expected to accept these traditions as unquestionably true. These are the traditions of society and induction into them which, according to R.S. Peters (1973), is what education is, and which has an indoctrinatory element. Peters admits that his concept of education generates paradoxes of this kind. So, 'if public traditions are the conditions of rationality, then inculcating these conditions cannot itself be rational because there are no criterion of rationality apart from those public traditions' (Thiessen, 1993, p. 96).

It would take too long to work through the intentions and consequences criteria but Thiessen has little difficulty in demonstrating their uselessness. Intentions are

notoriously difficult to identify because they require self-knowledge (how do we know someone else possesses it?) and may be mixed with a variety of short- and long-term goals. Whereas the consequences criterion can be undermined by our inability to identify precisely when the consequences of the wrong kind of teaching have occurred (how long do we wait to observe the effect?). Moreover and confusingly, 'it is difficult to establish the relationship between the closed mind and its cause. A closed mind can be caused by other ways than indoctrination' (Theissen, 1993, p. 150).

In the context of a defence of Christian nurture against the damning charge of indoctrination, the purport of this argument is to show two other things. Firstly, arising out of a consideration of the rational methods used in non-indoctrinatory teaching, it is possible to discern a shift occurring within the notion of rationality itself. Instead of presuming that rationality is always objective and complicit with a Cartesian model of the mind, of observer and uncontaminated observation, a new model of normal rationality is coming into being that accepts a constructivist view of knowledge, an organic view of mind and a recognition that rationality must be expressed by human beings shaped by personal context and social traditions. This reconceptualisation of rationality fits a post-modern zeitgeist and dissolves many of the positivistic objections to religious teaching that function to prosecute the charges of indoctrination.

Secondly, an attempt to locate indoctrination within the compass of 'total institutions' like prisons or Christian schools has to be made carefully since ordinary maintained schools share many of the characteristics of Christian schools by which total institutions are sociologically defined. If 'totality' is a matter of degree rather than an absolute quality, there is a need for discussion about the level of control acceptable within liberal democratic institutions.

The Shared Praxis Approach of Thomas Groome

Groome (1980; see also Groome and Horell, 2003) is concerned to construct an approach to religious education making use of epistemology that prioritises praxis. He works within the Christian tradition while taking care that his definition of praxis harks back to Aristotle and takes in subsequent philosophical developments from Hegel to Habermas. In this rich conceptualisation, praxis includes a critical and rational element and is not simply confined to reflection working directly in conjunction with activity. So for Groome praxis is the key component within a pedagogical process, and it is *shared* because it is shared between teachers and pupils and because it is directed by a common vision of the kingdom of God. In the preface to his book he explains how his attempt to teach by lecturing, by exposition of historical or propositional material, failed to engage pupils in a Catholic boys' high school in the USA. So he developed an approach dependent upon dialogue and exploration that gave a role to social and relational experience. This immediately enthused pupils and was, for its time, innovative. This process of praxis provides a particular sort of epistemology. It is an epistemology that accepts the full range of

experience but then draws out meaning and knowledge through critical reflection. Consequently there is no formal process by which truth-claims are tested. Instead, knowing is much closer to loving because it is akin to personal knowledge. Indeed, where pupils are inducted into tradition they are often also introduced to a religious community, and this necessitates coming to know people who are representatives of the community (e.g., pp. 146, 188).

It is the dialogue between pupils and teacher or among the pupils themselves that prevents this teaching process from being indoctrinatory. Where Groome's approach is weak, however, is in its drawing of a parameter within a particular religious tradition. There is no attempt to stand outside tradition or to compare one tradition with another or to consider objections to the tradition itself in its formative phase. Such objections *might* arise within the process of dialogue but, particularly with younger pupils, there is no reason why they should. Thus, if the tradition contains reports of miracles, there is no obvious way in which these might be properly scrutinised; their mere presence within the tradition confirms their historicity. Nor is there an obvious way of solving old problems with fresh thinking. For instance, if the grounds for opposing contraception developed by Aquinas are now outdated (because they are based on superseded scientific knowledge), can shared praxis criticise the tradition into which pupils are being inducted? In short, Groome's approach does not address the problems addressed by Smart. Rather it may be argued that Groome's approach could be preliminary to that described by Smart. We could propose a shared praxis approach for younger pupils that allowed them to be inducted into a religious tradition within the primary phase of education and that, beyond this in the secondary phase, a more Smartian analysis was applied.

If we try to relate Groome's approach outside a religious tradition or across several traditions, the shared praxis is much more difficult, if not impossible, to apply. This is because without reference to the kingdom of God there would be no common basis for the discussion into which teachers and pupils plunge themselves. The discussion would become free-ranging and without any obvious limitations, focus or direction.

The Humanist Contribution

The humanist position on religious education is less well-developed and less sophisticated than that which has been developed by dialogue with theology or educational theory. In the section that follows, the humanist contribution to debate on religious education is outlined in general terms and by reference to key publications in England and Wales. While there is an implicit philosophical dimension to these contributions, many of them are concerned with the law determining the treatment of religion within the educational system, and they take on a campaigning or polemical character. Although the discussion below is drawn from the situation in Britain, its relevance goes much wider.

The teaching of religion in schools within Britain after 1944 was for about 20 years almost exclusively confined to Christianity and, in the 1950s, religious

education could be said to have been confessional in its aims and intentions, although those who deplore confessionalism make too much of the official confessionalist stance to be found in some public documents (cf. Copley, 1997, pp. 101f). While there was undoubtedly confessionalism within religious education and some examination syllabuses were explicit in advancing the importance of apprehension by pupils of the life of Christ, there were other agencies—for instance the teaching unions—that were less happy to support anything evangelistic or dogmatic. And, truth to tell, the schools were sensitive to criticisms and, so far as one can gain an impression of classroom ethos 50 years ago, careful not to offend the consciences of unbelievers. Within the church schools the situation may have been different but in these institutions teachers could presume that parents wished their children to hear a Christian message.

In 1967 the Plowden report, *Children and their Primary Schools*, was published. It was a landmark document within the post-war period. It included many distinguished contributors, among them the philosopher A. J. Ayer (1968), who, together with five other participants, appended a 'note of reservation on religious education'. Ayer was a prominent humanist, if not atheist, and his note provides an insight into the thinking of humanists at this time.

They object to the teaching of religion in primary schools because they think pupils will inevitably need to study theology, a subject which is too recondite and too controversial to be included within the primary curriculum. Nevertheless, they say pupils should be given arguments for and against the content Christian beliefs and, for cultural reasons, they may be told Bible stories. Although morality is often seen as one of the main functions of religious education, and despite the fact that 'the moral example which the story of Christ' offers should not 'be discounted', it is from the atmosphere of the school rather than from homiletics that they think morality is likely to be derived.

In the 1970s and beyond, the British Humanist Association (BHA) and the National Secular Society comprised the two main associations to press the secular case, and they were able to do so without drawing upon discredited Marxist ideology. Humanism was largely apolitical and mainly appealed to intellectuals; it had little popular or mass support.

In the autumn of 1975 the BHA published a booklet *Objective, Fair and Balanced* that addressed the educational situation in England and Wales. The association pressed for the repealing of the sections of the 1944 Education Act requiring school worship, and wanted a new section that would allow religious education to include non-religious outlooks. It argued that

any education given at any county school to any pupil in attendance at the school with respect to religious or non-religious outlooks or systems of belief shall be objective and (taken overall) fair and balanced over the range of such outlooks and systems of belief (BHA, 1975, p. 47).

The association wanted RE to be concerned with beliefs (rather than practices), so that by 'objectivity' it meant that the teachers could teach about beliefs without

in any way encouraging pupils to embrace these beliefs personally; by 'fairness' that this teaching should be done in an impartial manner and without 'selection and half-truths'; and by 'balance' that the teaching of beliefs should be related to the whole of educational activity related to 'fundamental questions' (BHA, 1975, p. 25).

In an editorial in *Learning for Living* Hull (1976, pp. 82–84) discussed the booklet. He noted that the statement about non-religious beliefs was careful not to mention communism, presumably because of the widespread antipathy that this would have aroused. He also pointed out that it would be difficult to avoid other undesirable belief systems like Fascism as an object to study. He might have added that the notion that religion should be taught fairly is extremely difficult, if not meaningless, to apply since it presumes that there is some pedagogical mid-point within the presentation of religious or non-religious beliefs. Stray to the left of the mid-point and teaching becomes unfair in one direction (too critical), stray to the right and it becomes unfair in another (too credulous).

Again, Hull might have pointed out that the notion of objectivity as a teaching stance is set in complete opposition to the empathy that the phenomenological approach advocated. The humanist desiderata presume that teachers can offer religious beliefs to pupils within a vacuum and without critical discussion or emotional engagement. Beliefs may be presented like philosophical propositions or groundless superstitions. This cold and dispassionate classroom presentation does not help pupils to see how these beliefs are historically and culturally important or why people might be prepared to die for them.

The editorial elicited two replies. Harry Stopes-Rowe (1976) defined 'life stances' and was able to show that capitalism or even Facism would not properly fall within the concept. He argued that a life stance is 'whatever the individual finds to be involved in his response to ultimacy' and, in this way, found a way of including religion and humanism under one heading. John White's reply in 1976 attempted to take Hull to task. Among his comments is a clarification of the question of balance. Here he contends that the balance ought to be between religious and naturalistic stances so that there is no distortion in the formation of a child's values, beliefs and attitudes towards one or the other. White considers that the evidence for religious and nonreligious positions is such that all religions can be put into the scale against naturalistic stances. This, of course, begs a whole series of questions about the onus of proof between various belief systems. White appears to believe that it is 'fair' if all the religions of the world are balanced against one composite naturalistic view: in other words, if teaching about non-religious belief systems comprised 50% of classroom time.

So far as the danger of teaching about Fascism or other pernicious humanistic belief systems is concerned, he makes the point that Christianity has produced offshoots like 'Spiritualism, Exorcism and Fundamentalism and other charismatic sects' which, in his opinion, leave it in no position to throw stones at humanism. Such a point, however, ignores the huge gulf that separates the political oppressiveness of Fascism and the relatively innocuous political activism of most derivations of Christianity. We may say the British Humanist Association, wittingly

or unwittingly, was attempting by its contribution to redefine the terms of debate in a way that was advantageous to itself. Behind the language of fairness and balance may be seen a political agenda.

This political preoccupation was evident in the BHA's publications on church schools and religious education in 2001 and 2002. The 2002 publication offers a diagnosis of the problems that it sees are caused by religion within the state sector of education and then offers its solutions to these problems. It argues that, because British society has changed enormously since 1944, the current legal arrangements that allow church schools to co-exist within one dual system alongside common (or state) schools is due for overhaul. Using statistics suggesting that the public is unwilling to see the number of church or faith-based schools extended, it argues that all religious schools should be abolished, or phased out as the report puts it (2002, p. 16). The statistics here are open to manipulation. It appears that the public likes Anglican schools, as is shown by their oversubscription, but does not favour Islamic schools to which it is unlikely that non-Muslims would be attracted. Anglican schools, by contrast, attract pupils of all beliefs and none (Lankshear, 2003). In detail, and by reference to Human Rights legislation viewed from a particular perspective, that of protecting the right of parents to bring their children up in a religious tradition, it argues that church schools are *discriminatory* in their admissions policies, in their notion of collective worship, in their inflexibility over dress codes and, in some cases, holidays, and because such schools are likely to lead to fragmentation within British society, the time has come to abolish all of them whether they are funded by public money or not. Likewise, collective worship in common (or state) schools, despite the conscience clause that allows parents to withdraw their pupils from this activity, should also be abolished because of divisiveness. Collective worship should be replaced by 'inclusive' non-religious assemblies (2002, p. 36). Religious education, however, would be allowed to continue and non-religious life stances should be included within the RE syllabuses. Pupils or parents who wish for optional faith-based religious instruction should be permitted to receive this on school premises after normal school hours (2002, p. 3).

Religious education would 'give all children an understanding of the range of beliefs found in multi-cultural society and the values shared by most religions and ethical worldviews' (BHA, 2002, p. 11). The subject would aim to be 'genuinely inclusive and impartial' and this would prevent the need for any exercise of the conscience clause allowing withdrawal. Citizenship education would help to encourage respect for different national, religious and ethnic identities, and this in turn would encourage greater openness in RE. A larger number than the six principal world religions would need to be covered and, in order to avoid superficiality, the BHA would like to see 'a broader study of belief systems' and 'concentration in depth on core values' (BHA, 2002, p. 39), omission of much incidental detail that currently clutters up syllabuses (though what this is the BHA does not say), less reliance on faith communities when drawing up syllabuses and more and better teachers.

Space does not permit a detailed comment on every one of the BHA's proposals but it is important to note that this document, despite its obliging tone, is

arguing a case for a particular stance. For instance, although the document quotes accurate figures relating to declining church attendance—about 7.4% of the British population on a normal Sunday (BHA, 2002, p. 25)—it attempts to inflate its own importance by suggesting that it speaks for about 10% of the British population (BHA, 2002, p. 19) while omitting to mention the 2001 census which shows that over 70% of the population classify themselves as Christian. By comparison with church attendance the BHA's membership is miniscule (House of Commons, Education, Science and Arts Committee, 1981). The British Humanist Association and the National Secular Society claimed about 3,000 members each. But there was overlapping membership so the total number was lower than 6,000, and this at a time when church membership amounted to many millions.

More damaging and more pedagogically relevant, despite its references to 'life stances' and 'core values', the BHA thinks of religions as belief systems without any apparent understanding of the complexity of these systems, their aesthetic implications, the sense of community engendered by religion, the emotional and ritual aspect of religion and the extensive moral corollaries that flow out of most religious traditions. By conceptualising religions as systems of belief, religions are shorn of their vital characteristics, decontextualised and reduced to skeletons. Thus the BHA's very conception of religion implies a reductionist strategy that is designed to place religion in all its diversity onto a one-size-fits-all grid; and the only 'religion' that fits the grid perfectly is humanism.

Andrew Wright's Contribution

The most complex and philosophically well-rounded book dealing with religious education comes from Andrew Wright (2004). The sweep of his survey considers the roots of postmodernism, the impact of this on theology and consequences for pedagogy. He then draws out the implications of his conclusions for religious education in both common schools and church schools. Wright addresses a situation that is more complex than that facing Ninian Smart in the 1960s. Modernity, arising out of the Cartesian dualism of subject and object that generated the Enlightenment meta-narrative of unstoppable political and social improvement, has been dissolved by the discourses of liberalism and romanticism. Romanticism prioritises personal and experiential knowledge and authenticates it by reference to emotion or self-expression. Liberalism exists in a hard and a soft form, and it is the hard form that eventuates in a covert metanarrative that relativises all claims to fixed or absolute truth. Indeed, truth claims founder on the presumption that there is no overarching reality, metaphysical or rational, with which we may engage, since postmodernism only leaves us with the discarded fragments of images and concepts belonging to exploded metanarratives. From this wreckage (according to Baudrillard, 1994) a form of idealism made by the resources of language and technology comes into being to create a dazzling hyper-reality that is richer than our ordinary perceptions of the world while, at the same time, denying the distinction between truth and fiction.

Wright outlines the possibilities inherent within 'critical realism' which neither succumbs to the weaknesses of modernity nor to the criticisms of postmodernity. It occupies a middle ground that accepts we can only indwell the world rooted in particular time and space while, at the same time, accepting the validity and irreducibility of different academic disciplines. Consequently, we can affirm the reality of our knowledge of the world while recognising its provisionality. We can reject the nihilism implicit within anti-realism but still ensure that our 'horizons of meaning remain flexible' (p. 65).

Theology must walk into this *mêlée* of philosophical ideas. Wright traces the development of Western theology from Augustine through Ockham, Calvin and the deists to show how the impact of romanticism interacted with religious experience to issue in a fundamental shift in our understanding of religious language. While classical theology operated under a cognitive-propositional understanding that could carry notions of truth and error, romanticism gave birth to experiential-expressive religious language that became, in the hands of John Hick (1977) and by amalgamation with liberalism, a theology that identifies the ultimate and transcendent in every world religion as one and the same reality. Yet Hick's synthesis fails to address the problem of religious pluralism. Something better is required, something that recognises difference, and the authenticity of the Other. Two potential candidates, the radical theology of Don Cuppitt and the negative theology of Jacques Derrida, are deficient for other reasons: by their subservience to postmodern philosophy they rule out the possibility of God's self-revelation (p. 108).

Other theologies are examined, particularly that of post-Holocaust Judaism but, in the end, Wright argues that Trinitarian theology is capable of making realistic statements about God that run against the grain of postmodern thought without descending into totalitarianism. This is because, from an epistemological point of view, God can never be *fully* understood, with the result that Christian truth claims remain at the level of contingent rationality, and, substantively, because the God being revealed is the God of love.

Pedagogy must operate within the same philosophical *mêlée* as faces theology. Here the project of contemporary education, arising as it does through the development of a tension between classical education and Rousseau's subsequent romantic revision as amplified by liberalism, issues in progressive education whose goal is personal development. Such an educational programme inspires an anti-realist pedagogy that dispenses with any conception of a curriculum that advances knowledge. However, such a pedagogy is neither justifiable nor desirable because it simply reproduces the 'repressive tendencies of modern educational theory in a post-modern guise' (p. 165). What is needed is a critical pedagogy to function within a framework of critical realism and, within religious education, what is needed is an extension of this pedagogy that, in addition, attends to the politics of difference while making use of four key virtues that may function as values. These virtues are those of honesty about our entanglement with language; receptivity to horizons of difference; wisdom understood as the notion of rationality developed by critical realists and, finally, truthfulness that admits to religious incompatibilities

and is suspicious of the dogmas of anti-realism and various types of religious fundamentalism. This allows religious education to be offered to children within an educational context that is self-critical about its own assumptions and confessions and yet big enough to make room for the possibility of transcendent reality.

Political Contexts

At this point we turn to the political arena. This is because philosophical considerations concerning the activity of religious education or, indeed, about church schools, are highly dependent upon the political context in which that discussion finds concrete expression. Although philosophical discussions in the past have been located in a purely theoretical space, this space was created by an implicit enlightenment tradition which very early on applied itself to political questions (Locke, 1993/1680).

The discussion here presumes that religious education and church school education take place within democratic societies. In other words, there is an assumption that as wide a range of interests and views as possible ought to participate within the formation of policy so as to secure maximum consensus. Behind the discussion about beliefs and values is the assumption that they will contribute to the cohesion of democratic society. This is why the accusation of divisiveness or discrimination, when it is levelled against religion, is so powerful.

The presumption of this chapter, then, is that philosophical approaches to religious education are being implemented within democratic societies that use public funding to support education. Such societies do not wish to fund the forces of anarchy or to sow the seeds of fragmentation. Whatever rights of religious expression might inform public policy there are, both in law and in philosophical expositions of liberalism, recognitions that physical restraint, even violence, may be used to limit freedom where that freedom threatens the freedom of others (Mill 1961/1859). Consequently all forms of education are likely to be expected to observe analogous restraints on intellectual and spiritual liberty.

Naturally the political structures that have been erected over many years vary from country to country and, as Judge (2001; 2002) has pointed out, the position of religion within educational systems varies between France, United States and Britain even though they are all democratic countries belonging to the Western tradition. The theorisation of Smart was designed to be applicable within Britain, where church schools are funded with public money and where they share with common (or state) schools similar provisions for religious education and collective worship. Groome, by contrast, addressed the position within the United States, where religious education might occur in the context of church attendance or private Catholic schools. Thiessen, coming from Canada where the separation of church and state has ambiguous historical rootage (Miller, 1993, p. 333), was nevertheless concerned to address issues advanced by those who wish to exclude religion from education and to debar religious schools from public funding. Wright applies his analysis to the broadly Western world that is home to liberal common schools

carrying forward the traditions of the enlightenment and to long-established church schools because, in both, the same intellectual forces are at work and the same virtues may function.

In all these societies, at least after the 1960s, political structures have been infused with a philosophy of pluralism. Such a philosophy accepts the equal validity of a variety of religious and cultural manifestations and articulates this in terms of general rights so that every minority—religious, ethnic or sexual—can utilise public space with equal confidence. Pluralism becomes a wider force shaping the way in which social relationships are transacted by contributing political principles and motives to the conduct of civil life, the framing of legislation and the role of schooling.

Along with pluralism as a cultural climate is the educational concept of multiculturalism that, in its simplest form, attempts to nurture the cultural identity of numerous individuals, often by curricular support, within an educational system. Such identity may be shown by dress, marriage or burial ceremonies, music, food preferences and other forms of non-political activity. The dilemma of multiculturalism identified by Bullivant (1981) is that, while minorities may wish to see their cultural identity fostered within a public education system, it may be to their advantage to gain expertise in the language and customs of the dominant (ethnic) elite to compete for higher salaries and prestigious jobs. There is therefore a paradox at the heart of multicultural education, since preserving minority cultures may also condemn their least academic adherents to poverty and low status.

Knowledge Transformation

To the political context in which philosophical considerations about religion occur must be added those two great agencies within contemporary societies: universities and the mass media. The universities have from their earliest times been places where training for the professions has been carried out alongside research, even if research in the Middle Ages amounted to the study of classical texts, and attempts to drive the frontiers of knowledge forward were made through dialectical debate (Bowen, 1975). But the point is that universities have continued to function both as the repositories of historical knowledge, often by the protection of precious manuscripts, and as the factories and laboratories of new knowledge (Silver, 2003).

The advent of the 20th century mass higher education has increased the leverage of universities in relation to entire social systems, and this leverage has been accentuated by the relationship that universities have developed, on the one hand, with the mass media and, on the other, with governments who, increasingly in the modern era, have become the paymasters of university campuses (Roberts, 2002). The linkage between universities and governments tends to increase in times of war (or terrorism) when universities have turned their research facilities toward solving military problems.

The ability of universities to generate and classify knowledge is seen in the work of scientists and technicians and in the influence of philosophers who, during

the 20th century, were almost all employed, at some stages of their careers, in the university sector. Philosophy began to see itself as being able to provide a comprehensive vision of the human condition (for instance, in the evolutionary sociology of Herbert Spencer or the existentialism of Sartre and Camus) or, failing such a grandiose scheme, as having the capacity to formulate a verification principle with the penetrative power to strip away widely-held delusions.

The mass media constitute a vast sprawl of print-based, digitised, televisual, imagistic and voice-based output that have altered the generality of perception within modern societies. Whereas 200 years ago there might be uniformity within the village and discussion across a narrow range of possibilities, the 21st century has begun to grow accustomed to a globalised clash of images and perspectives pressing every possible opinion with vibrant urgency. Such a plethora of views has surely contributed to the phenomenon of late modernity or postmodernism whereby meta-narratives have been first broken and then rejected. Lacking criteria by which to make judgements about the pronouncements of politicians and philosophers, every opinion is deemed to be of almost equal value and religion is, except within the school system, privatised and placed within a largely interior world where it can neither be challenged nor analysed.

In the light of these huge changes, changes that are taking place against an exponential growth in the world's population, it is possible to discern several megatrends. Darwinian evolutionism is widely accepted in the West and is thought to be confirmed by researches into DNA, with result that a materialistic view of the world appears to be supported by harder evidence than that provided by fossil sequences or the statistical manipulation of small gene pools (Gribben, 2002), as in the case of Gregor Mendel's experiments. Such a value system sits alongside a passion for green issues, biodiversity and global warming so that, despite genuflections towards post-modern relativism in the media and in university circles, there is an underlying, but not yet dominant, perception about the undeniable dangers inherent within the human condition, dangers that are only exacerbated by political conflicts fought through terrorist organisations.

Towards a Conclusion

It is now time to assess the approaches of Smart, Thiessen, Groome, the BHA and Wright to the solution of philosophical problems within religious education, situated as they are within the politics of democratic states whose universities and mass media fuel postmodernity that rides on top of a Darwinian worldview informed by fears of global catastrophe caused by terrorism and climate change.

Each contribution can be assessed by reference to three separate areas. First, in relation to the conflicting truth claim between religions or between religions and science. Second, by reference to the political implications of its philosophical analysis. Third, by reference to the pedagogy that it creates or assumes (cf. Kay, 2002).

First, then, Smart produces the most subtle and simple analysis of the clash between religion and science by offering an inductive hermeneutic of foundational texts while drawing attention to the parallel between religion and science: their similar logical shape may allow them to claim equal epistemological status. There is a well-worked recognition of the intellectual traditions of science and religion but little that rings true in relation to the psychological capacities of pupils. Groome's work is more open and allows shared praxis to create an implicit relativism, since different conclusions will be drawn by different groups of pupils and teachers in different schools. Yet this approach has the advantage of allowing conflict into the open and encouraging it to be resolved at the micro-level within particular working groups of human beings. The humanist approach is concerned to delineate difference rather than to explain it or resolve it. It appears to envisage a kind of checklist of beliefs for each life stance, with reference to overlapping ethical values when this is possible. Wright points out the weaknesses of scientific positivism since this elevates scientific methods to an imperious position where they may determine the truth claims of other areas of human existence. Wright's willingness to recognise difference and to leave truth claims unresolved in the interests of educational honesty is a welcome proposal.

Second, Smart operated in an era when universities were expected to be intellectual authorities and, consequently, his reform programme for religious education is partially a top-down affair that resolves problems between religions within the university setting and then seeks to apply these further down the educational system at school level. Politically, the most sophisticated of these approaches is found among the humanists whose attempt to redraw debate around their own ideal notion of fairness allows them to include their preferred religious position within the curriculum while seeking to close down church schools that have, in some cases, hundreds of years of service to their communities. Consequently, the humanist position looks sectarian and negative. But Wright is also politically sophisticated in his recognition of the totalising impact of post-modern discourse. His willingness to reinstate truth and honesty as educational virtues has political implications for our conceptions of multiculturalism and pluralism, even within educational settings and variant democratic polities.

Third, pedagogy is implied or worked out within all of these philosophical approaches, although the most sensitive in relation to the nature of religion itself is that of Smart, and the most simple, but probably effective, in relation to the classroom is probably that of Groome. Wright has integrated his pedagogical approach into an overall philosophical analysis and this makes it attractive. The implied pedagogy of the humanist position appears to be rudimentary and to have little affinity either with the nature of religion, the philosophical location of religion within the current era or the psychological capacities of children.

Although the philosophical and political context of educational debate is perennially important, the imperatives of ecology and the instabilities perpetrated by stateless terrorism are of such ultimate importance as to find a place more properly within religion. In other words, it is religion that addresses global problems and it is

religion that may help to solve or to perpetuate these problems (Kung, 1994). Good religious education can help to foster the conditions whereby religious adherents within democratic states put their energies towards human flourishing. Or, to put this another way, it is the indoctrinatory and irresponsible transmission of oversimplified religious solutions that threaten our existence. The restoration of the Islamic Caliphate across the entire Middle East, the unthinking Christian support of right-wing American foreign policy or the abolition of religious charities in a burst of humanist zeal are all, for different reasons, highly undesirable. Yet religious education within the common schools of democracies can make such outcomes less probable while, at the same time, protecting and introducing the beliefs, practices, values, hopes and visions of major religions to successive generations of children.

RELIGIOUS EDUCATION IN EUROPE: COMPARATIVE APPROACH, INSTITUTIONS, THEORIES, RESEARCH

Karl Ernst Nipkow

Protestant Faculty of Theology, University of Tübingen

Introduction

In this chapter, Karl Ernst Nipkow provides a wide-ranging discussion, which identifies and analyses issues that surround the theory and practice of religious education across Europe. He discusses the tensions between the individual and community aspects of religions and how these interplay in societies. Related interplays are between the private and the public interests of religion, between developmental and initiating processes, between the individual search and applying religion to social issues. The complexities of religious education practice within these competing yet interrelated pressures are discussed within the framework of contemporary European education, and against the background of Protestant history.

Comparative Religious Education Theory and Semantics

Lacking Comparative Research

Since 1978 the *International Seminar on Religious Education and Values* (ISREV), convened by John M. Hull, Birmingham, UK, has been the main instrument for general scholarly exchange about theory and semantics in religious education. The Seminar has been gradually transformed from a mainly Anglo-Saxon and Western European enterprise to a more global one, which now includes scholars from other continents. Nevertheless it is still lacking full global representation, since Eastern Europe (Russia) and the French and Spanish speaking world (France, Southern Europe, Latin America) are absent with only few exceptions. International societies such as ISREV are the soil for comparative knowledge and cross-cultural research. The *International Academy of Practical Theology* (IAPT, since 1991)

has added new resources to a fruitful network of communication. (For European associations contributing to exchange see the European Forum for Teachers of Religious Education (EFTRE) (www.EFTR.org), the Inter-European Commission for Church and School (ICCS) (www.iccsweb.org) and the Coordinating Group for Religious Education (CoGREE) (www.cogree.com.) However, international comparative research in religious education that deserves this name exists only in its beginnings (Osmer & Schweitzer, 2003a). Nation-specific portrayals of RE in Europe were first published in the seventies and eighties by the Comenius Institute (Muenster, Germany) (www.comenius.de). Up-dated descriptions are to be found in Mette/Rickers, 2001. The exchange of practical experiences and research is also promoted by journals, mainly the Journal of Empirical Theology (JET, since 1988) with the focus on empirical studies, and by Panorama International Journal of Comparative Religious Education and Values (since 1989), the latter with the ISREV conferences as background.

Asymmetry in the Command of Languages and Semantic Fluctuation of Key Constructs

Another obstacle is asymmetry in the command of the main international languages, and their usage at international conferences. A major factor which plays a role in mutual understanding and cooperation is semantic pluralism, and fluctuation with regard to key terms. The developments in the Western style of dealing with religious education have, to a great extent, dismissed the theological language game, and replaced it with terms which are supposed to build necessary bridges between the believers of all world religions, and to appeal in particular to the highly individualistic ways of a religious and non-religious search for meaning in secularised societies. The new key construct is the term spirituality. Critical voices speak of the age of the spiritual shopping centre, and draw the conclusion that religious education must prepare people to enter into this shopping centre in order to learn how to distinguish between different qualities in spiritual resources. Even the broad term 'religion' is considered as theoretically too narrow.

Where are the criteria for a rigorous quality check of all of this? To what extent are we justified in clarifying the theological identity of each religion, and introducing children into them? The way of religious education in a plural world needs both; that is, recognisable religious traditions and convictions, and a true dialogue between the different cultures and faiths (Nipkow, 1998) in which 'the Western lamp is not the only one we have' (Panikkar, 1987, p. 123). 'Pluralism in its ultimate sense is not the tolerance of a diversity of systems under a larger umbrella; it does not allow for any superstructure' (Panikkar, p. 125). An 'umbrella' can be constructed on the objective or the subjective level. On the objective side the attempt has been made to design a rational Kantian construction of 'the Real an sich', either incorporated in 'divine personae' or envisaged in 'impersonae of the Real' (Hick, 1989, p. 246). On the subjective level 'spirituality' is the most general term for indicating the self-transcending of the individual. Originally the word *spirituality* belonged to Catholic monastic theology (*spiritualité*). It is derived

from the Latin word *spiritus* which meant the Holy Spirit in the Christian creed. Today the term *spirituality* serves to assume many meanings in relation to each individual's preferences or the lifestyles of groups and movements. This extension opens the door to fluctuation, disparity and often vagueness of language in religious education discourse.

Religious Education (RE) and Church Schools as Selected Topics Against the Background of the Public Relevance of Religion

Paradigms of Structural Educational Patterns

Education takes place in different forms of learning. The most effective seems to be informal learning in the life of a group, a community or a society as a whole. The young generation adopts the norms, convictions and attitudes which are held by the majority, and are continually socially reinforced, mostly on an unconscious level. In the realm of religion, the well-known pattern of letting children emotionally and ritually participate in religious family life, liturgy and church festivals is based upon the knowledge that 'life-forms' with their 'language-games' (Wittgenstein, 1958) exert a strong informal or functional socialising influence on children as well as on persons in general (paradigm of *unintentional functional* education). A main channel is religious learning by face-to-face contacts and via imitation. In modern societies, the former religious ecology of the family is more or less broken. Religious educators like John Westerhoff (Westerhoff, 1976) attempt to re-establish the educational function of religious communities. 'He advocates a paradigm shift within congregational education, calling for the elimination of the schooling-instructional paradigm and its replacement by a religious socialisation and faith enculturation paradigm' (Osmer & Schweitzer, 2003a, p. 175). Only an identity conscious, tradition bearing religious community can help children to know who they are.

Schooling is the classical form of the organisation of intentional education as direct formal learning. It includes all ways of intentional educational procedures, mainly instructional procedures (paradigm of *intentional-direct* education). A third form combines the advantages of both types by deliberately establishing an artificial, functional educative environment or ecology (paradigm of *intentional-functional* education). In modern religious education practice, this direct-indirect modelling can be observed everywhere, e.g., in the display of religious items from various religions for learning by discovery (Hull, 1996; Grimmer, 2000) or by developing a specific culture in the classroom and in the school as a whole. Many educational methods of today, in this sense, go back to the Reform pedagogy of the first decades of the twentieth century.

Religion Between Privatised Individualistic Spirituality and Public Responsibility

The following analysis focuses on direct formal religious education in two institutions: state schools and denominational schools. The latter try to apply religious

perspectives also in other subjects of the curriculum. The argument of this chapter leaves out all phenomena of informal religious education. It also sets aside religious nurture in family and congregational life. This selection first obeys the historical development in Europe which has been strongly influenced by the theology of Reformation, and secondly, follows systematic arguments.

In the 16th century Martin Luther (1483–1546) and Philipp Melancthon (1497–1560) demanded a separate instruction in Christianity for boys and girls in the curriculum of all schools for about two lessons a week. This innovation became the main starting point of RE in Europe, since the Roman Catholic Church in the Counter-Reformation followed the Protestant initiative with a quite similar strategy of transmitting a Catechism with the emphasis on the youth. On the Protestant side the aim was to inform about the new theological approach to Christian faith in elementary terms, and to enable everyone to explain and justify his or her own faith in a clear, reflected way. This individual religious self-reflection with the democratic emphasis on lay-people was to become an important source of the later concept of secular individual self-education (*Selbstbildung*) in the time of Enlightenment and Idealism. Thus, religious education in the Protestant perspective is obliged to promote a self-critical religious understanding. Personal faith defined itself as independent of hierarchical clerical authorities. The new norm was the individual conviction in relationship to the authority of the Word of God in the Bible. In the Swiss Reformation (John Calvin 1509–1564) the new independence of faith was passionately defended against persecuting political authorities. In the past century the great European Calvinist theologian Karl Barth became the prominent head of theological resistance against Adolf Hitler (see the *Barmen Theological Declaration*, 1934).

The second most influential systematic idea shared by all main theological Protestant camps was the new spiritual appreciation of the individual Christian's vocation in the secular professional world, which was interpreted as God's call to responsibility for the common good. It abolished the former hierarchical spiritual ranking in the medieval church, which regarded the monastic status as the truly holy vocation on the path to religious perfection. Now God's twofold government, his spiritual on the right hand and his secular on the left hand, led to a new appreciation of education in both spheres. The acquisition of a good education, of general and professional skills and knowledge, was needed to fulfil God's will as creator with respect to social life. Education in general, not only religious education, became a main instrument in preserving God's humankind in a world of sin, and in the battle against the satanic power of evil. In the 17th century John Amos Comenius (1592–1670) emphasised not only the preservation, but—in the light of the resurrection of Jesus Christ—also the striving for universal progress with regard to all human affairs. It is these two lines of theological ideas, the self-reflective Christian autonomy of the individual believer and the public co-responsibility of the church for the human quality of the society, which constitute the general perspective of RE in state schools and of church schools in European Protestantism today.

There are liberal and conservative wings in all major religions in Europe and worldwide, although not every religious group sees their situation in this way.

From the very beginning of Christian education in the East the traditions of various churches have differed. The Orthodox Russian church is fixed upon liturgy, and many believers see the monastic life as their spiritual ideal. The idea of public responsibility and the resistance to arrogance and fundamentalism in their own Church (Fedorov, 1998) or the interest in inter-denominational contacts and understanding (Kozyrev, 2001) is only slowly gaining ground, with a small minority, against traditional spiritual, pious self-seclusion. The official mainstream of the Russian Orthodox Church expects every Russian citizen to be an Orthodox Christian, which, in view of the existing majority of atheists as a result of the Communist past, is an illusion (Minney, 2000).

The common denominator in the public European discourse is the view that the religious, moral and spiritual dimensions of religious education should not one-sidedly be directed towards the development of a totally privatised, individual spirituality. The political involvement and impact of religions in global, regional and intra-societal conflicts is too obvious. This fact explains why the biblical tradition is reconstructed from the perspective of its contribution to resist violence and promote peace education in global terms (Nipkow, 2003).

The Interests of the European Council in Religious Education

In several declarations the European Council has expressed its interest in religious tolerance between religions, and in the constructive contributions of all religions to the general good. In this policy religious education played a prominent role. In 1993 the *Assembly of the Council of Europe* published its recommendation 1202 on *Religious Tolerance in a Democratic Society*. The earlier declarations pointed to the same basic requirement: recommendation 963 (1983) on *How to Reduce Violence*; recommendation 885 (1987) on the *Jewish Contribution to European Culture*; recommendation 1086 (1988) on the *Situation of the Church and Freedom of Religion in Eastern Europe*; recommendation 1162 (1991) on the *Contribution of the Islamic Culture to European Culture*; and recommendation 1178 (1992) on *Sects and New Religious Movements*.

In each of these declarations the Council expressed the conviction that all great religions in Europe—Judaism, Christianity and Islam—can make a positive contribution to the development of tolerance as a necessary ingredient of human culture. Evidently the Council wanted to elicit the constructive potential of religion. Yet it was clear that European politicians were also deeply concerned about the destructive potential of religion. Throughout history religion has been two-sided, exercising the powers of both reconciliation and conflict, love and hate, respect and disregard of human dignity, both granting and stifling religious freedom.

New Challenges in the Context of Present European Politics

Two recently published volumes on religious education—one compiling the papers of an International Symposium in Istanbul from 28–30 March 2001 (*Din Öğretimi*

Genel Müdürlüğü, 2003), the other a collection of articles with the emphasis on Eastern Europe (Poland, Russia, Ukraine, published in Poland) (Kucha, 2004)—express the efforts of both countries to prove their competence in the socio-political and cultural context of a growing European community. An open question is whether Turkey belongs to Europe and should become a member of the community. The traditional Eurocentrism is heavenly challenged, and so are the European churches in view of the many millions of Muslim European citizens. All religions are asked to spell out their importance and their future functions in common European public affairs in understandable and tolerant terms. Religious education has to fight against prejudices. An individualistic religious or non-religious spirituality is no sufficient aim and meets no public interest. If religions convert to become contributors to a ‘spiritual shopping-centre’ (see the article by Ph. Hughes in this Handbook, section 5, 1), ironically superseded by new age movements at that, they deprive themselves of the chance to convince others by an identifiable public role. This role is strongly defended by J. W. Fowler (Fowler, 1991, pp. 147–197; cf. Osmer & Schweitzer, 2003b).

The arguments given above explain why church-related schools, and RE in state schools, are both regarded as important institutions in the public sphere. In Germany and elsewhere in Europe, Christian RE and church schools understand themselves primarily as an essential part of the public school-system in a civil society, not as an instrument of the churches for any egoistic clerical or dogmatical interests. On the other side the links to a self-critical theology and to the prophetic mandate of the churches give RE and church schools an independence of their own over and against the power and the interests of governments in merely a civil religion (Bellah, 1967). An individualistic concept of ‘spirituality’ will hardly be able to release a critical and publicly relevant consciousness. The trend to the inwardness of individual piety and spirituality has also become a major obstacle to the re-creation of the Christian mission today. Is RE, therefore, to become a form of mission? No, it is education. The next section of this chapter outlines the legal and institutional pre-conditions that are necessary in order to properly discuss the conceptual perspectives.

Legal Framework and Educational Organisation

Separation of State and Religion and the Basic Right of Religious Freedom

In Europe church and state are more or less separated. A liberal pluralistic democracy forbids the one-sided identification of the state with any specific religion. Nevertheless the ways of implementation vary. In the United Kingdom there is a state church (Church of England) as well as in Norway, where changes in the curriculum of the training of ministers have to pass the Norwegian parliament. At the other end of this spectrum, France has a strictly laicist separation of state and religion in state schools without RE in the curriculum, except for the Department of Alsace, because the former institutionalised RE when it belonged to Germany. The origin of this strict separation goes back to the French Revolution of 1789.

In the era of Communist rule in Eastern European countries (Union of Soviet Socialist Countries, Poland, German Democratic Republic, Czechoslovakia, Hungary, Roumania) RE in state schools was abolished. Karl Marx had assumed that all religion would die out. The belief in a divine reality was incompatible with the doctrines of historical and dialectical materialism. While in France there was a sceptical laicist attitude, the Communist pattern of separation was a hostile one. Today the former Communist countries have a democratic constitution and RE is re-instituted everywhere.

In the middle of the spectrum we see the solution in German speaking countries (Federal Republic of Germany, Austria, Switzerland). One can describe this as a cooperative form of separation, i.e., the state is religiously neutral and the right of *negative religious freedom* is to reject religious claims or force by the state. At the same time the constitution provides for opportunities of confessional or denominational RE in state schools, theological faculties at state universities, and the public integration of educational institutions for children (Kindergarten) and adults (Protestant and Catholic Academies) which are financially supported. This *positive religious freedom* in favour of the religions expresses the appreciation of religion by the state. In Switzerland the situation differs between the 26 regional Kantons.

Today the governments in Europe share one new great problem: a growing religious pluralism which transcends the traditional Christian heritage. All religious education solutions have to obey the fundamental basic right of freedom of religion. One difference results from whether the negative or the positive aspect of religious freedom becomes the leading principle. Historically and logically there are only a few competing solutions.

- a. the laicist solution with no RE at all (France);
- b. RE in all schools in a multi-faith approach (England and Wales);
- c. several separated forms of RE combined with mutual exchange and instructional cooperation (Germany);
- d. moral education (ME) as a substitute for religious education in the curriculum or as an alternative option.

Religious Indifference and Atheism and the Political Interest in Moral Education

Europe is a continent which has been shaped by Christianity and the Enlightenment including radical religious scepticism and atheism. In big German towns (Frankfurt, Hamburg, Berlin) the majority of the population does not belong to any church. In East Germany church membership is lowest, consisting of only 20–25% of the population. The largest non-Christian religion is Islam, with about 800,000 Muslim children in the German school system. This situation explains why moral education (ME) also plays a decisive role. The political authorities need ME or Practical Philosophy for those pupils whose parents reject, or who themselves reject, Christian RE, which is possible from the age of 14. Since the state is interested in transmitting moral values and certain religious information, the subject ME includes at least

some religious material. Further reasons in support of ME in the curriculum are the cultural public interest, for religions are part of the national culture, and the vital political interest in values education to ensure the inner coherence of the society.

There has been an interest in a political religion since the time of ancient Rome. In nations with Romance languages (France, Italy, Spain) ME is part of education for citizenship (*éducation civique*, *educazione civica*, *educación cívica*). In Russia and in the Republic of Slovakia, ME is a subject of its own, named *eticeskaja grammatika* or *Etická výchova*, *Ethical Education* (Brüning, 2002, p. 396). In Germany *Ethikunterricht* or *Praktische Philosophie* is also an independent subject in the curriculum.

Muslim pupils either attend ME or the confessional Protestant or Catholic RE which has more or less developed inter-religious and inter-cultural educational dimensions according to the situation. Sometimes Muslim parents explicitly prefer RE instead of ME, because of the fact that belief in God still plays a constitutive role. By the instrument of free options the right of religious freedom is carefully taken into account. At the present time, the year 2005, some regional governments have developed an Islamic RE with support of the Protestant and Catholic churches.

In those countries where a greater number of different religions makes it impossible to organise models c) and d) above, the solutions tend to a multi-faith pattern, as in England and Wales. In Norway the traditional Christian RE, based on the Lutheran state church, has changed its methodology in this sense. In Switzerland the Kanton Zurich is about to introduce a new subject obligatory for all called *Culture and Religion* for the general development cf. Bakker et al. (2006ff.); Heimbrock, 2004; Larsson & Gustavsson, 2006; Schreiner, Pollard & Sagberg, 2006; Zonne 2006.

Religious Schools (Church Schools)

In Europe most religious schools are shaped by the Christian tradition (Francis & Lankshear, 1993; Marggraf, 2004; Schelander, 2004), as illustrated by the following statistics. The Church of England owns 4,818 schools, i.e., 21.74% of all schools in England. In France, Catholic schools dominate. In the Netherlands 60% of all schools have been established by religious societies, and there are 30% Reformed tradition, 30% Catholic, three Jewish schools, three Hindu schools, 37 Islamic primary schools and two Islamic schools at the secondary level. In Germany church-related schools amount to 2,200 schools, the biggest group being Catholic (1,156). In total the proportion of pupils attending church schools in Germany comprises only 5%.

The following factors contribute to the differences noted above. The first factor is the minority or majority status of the religion, and both majority and minority status of a religion cause it to emphasise having its own schools, either because of the powerful tradition of a state church as in England, or because its own schools are the only way to be present in the public educational sphere, as in France. In Germany the Catholic Church tries to realise its interest in having its own schools, in particular in those regions where it is in a minority position, especially in the traditionally Protestant Northern (Hamburg) and Eastern regions with Catholic families of only about 4% of the population.

Another factor is of a fundamentally political nature. Either the state respects the right of the religions to their public self-presentation and self-interpretation, such as in the Netherlands, Germany, Austria and elsewhere, or it does not. The Netherlands provide for at least some Islamic schools, since a pluralistic school system belongs to the national tradition. In England and Wales, Islamic schools would possibly undermine the multi-faith approach to religious education, and so its advocates tend to resist Islamic schools. In Germany religious schools are welcomed as the expression of a liberal plural society and of the educational co-responsibility of the religions (Nipkow, Elsenbast & Kast, 2004).

Religious Identity and Inter-religious Understanding

Aims and Effects of Various Forms of RE

Different institutional solutions are linked to differing aims and will produce different effects. A multi-faith approach, as shown in model b), will emphasise the learning of religious togetherness, friendly encounter and the experience of tolerance, which is disturbed by presenting major differences between the religions. The advantages of this approach are obvious, but the disadvantages are neglected. On the one hand there is a richness of several interesting and educational creative approaches by combining the phenomenological (Smart, 1984), experiential (Grimmitt, 1973) interpretive and ethnographic (Jackson, 1997) methodologies. The overall aim is directed to a commonly shared spirituality and to a highly individualised spiritual search. On the other hand, this interest must reduce the role of specific faith differences between the world religions, even though in the eyes of the believers these might be very important. Another side-effect is the caution that is applied to the making of value judgments about particular religions. The multi-faith approach is based on religious studies; specific theologies, i.e., Jewish, Christian and Islamic theology, play a subordinate role.

The strength of the multi-faith approach is the weakness of model c) where RE is given in denominationally separated groups, such as in Germany: Protestant RE, Catholic RE, Moral or Philosophical Education, in some towns Jewish RE, and preliminary attempts with Islamic RE. In Austria Islamic RE has existed since 1912. A major objection to this response to religious pluralism is that separation fosters intolerance in the population. One must not forget that the pupils will be instructed together in all other subjects and that the separating influence of a two-lessons subject on attitudes and behaviour should not be overestimated. In Germany and Austria there is no discussion about this point, since confessional RE has become open-minded and has lost its former confessionalist outlook.

The majority of Protestant religious educators prefer a cooperative model as shown in pattern c). The overall aim is not a missionary one; the pupils are to become familiar with the religion of their option and to learn also to understand other religions and world-views. The aims are realistic. They include basic religious knowledge, awareness of the nature of religious experience and respectful attitudes

towards people with different ethnic and religious backgrounds. The advantages are seen in the following effects:

- separate religious education for each religion allows for a broader and deeper understanding of their own religion: there is more time for each religion so, as far as possible, superficiality is avoided;
- each pupil has the right and the opportunity to become familiar with the religion of his or her cultural heritage and family tradition;
- the numerous children and young people who have never been introduced to any religious tradition, but who voluntarily attend confessional RE (in East German regions up to 60–70%) can learn at least about one specific religion in a deeper way;
- learning about one religion intensively means to become aware of the nature of religion in general, a fact which supports understanding of other religions;
- the instructional phases of inter-confessional and inter-religious cooperation (or cooperation between RE and ME) provide the necessary exchange around topics of common and controversial interest;
- elementary theological clarification is constitutive for each form of RE (Christian, Jewish, Islam);
- consequently information about and discussion of religious truth-claims forms a constitutive part of the approach;
- truth-experiences essentially belong to each religion; controversial discourse is not avoided by suspending judgment;
- tolerance is learnt through understanding religious differences and value-systems.

Church Schools in Europe Between Ghetto and Self-secularisation

In many European countries the churches are educationally involved as partners of the state, not only with regard to RE in state schools, but also by maintaining their own schools. Empirical studies confirm their attractiveness among parents independently of their church membership. In other words, a considerable number of parents who are not bound to church life appreciate church-related schools because of the school-climate, the positive interactions between teachers and students, the higher amount of individual educational counselling, the high participation of parents in shaping the school-culture and because of high standards and achievements in some academic subjects and in social competence. For many parents the religious factors do of course play a role too, but often more as an accompanying side-effect.

Conservative evangelical Christian groups mistrust this concept. They form an active minority, and cultivate their own schools alongside the official educational church policy, pursuing their interest to transmit the 'true' faith and to prepare children to become 'true believers'. These schools strive to serve as a bulwark against the temptations of the time. They complain that the 'normal' church schools do not promote faith. Church authorities concede that the question whether, for instance, Anglican schools 'will produce the Anglicans of the future' must plainly be

answered with 'they have not' (Brown, 1988, p. 166). The broad research on Church schools in Great Britain (Francis and Lankshear, 1993) has delivered realistic results in this respect.

Thus the general situation of Christian schools in Europe is, at least in some countries, that between 'ghetto and self-secularisation' (Marggraf, 2004). In Great Britain a trend to isolation is acknowledged: 'The issue of isolation knocks at the door of all religious state schools—for some it knocks louder than others'. (Brown, 1988, p. 167). On the one hand, church authorities and groups of parents want their own schools to become strong faith alternatives to the majority of secular schools. On the other hand, in particular in Germany, the church-related schools strive to share the aims of modern schooling and at the same time to show their Christian profile.

Learning as Individual Self-organisation and Through Difference

Religious education today has to tackle two main problems: first how to organise learning through difference, and second to acknowledge that all learning is self-organisation (*autopoiesis*). To begin with the second: cognitive psychology, system-theory, constructivistic epistemology, and neurobiology show that the consciousness of an individual cannot be *directly* influenced by educational interventions from outside. All perceptions that are received from the outer world will be adapted in the inner consciousness. Their effect is dependent on the individual transformational processes of each person.

This fact alone, apart from normative objections, forbids the idea of education as *imprinting/shaping/forming*, which perhaps is the oldest thought-pattern about education, evolutionarily taken from handicraft and technology (education as technology). Nor is education adequately conceived of as *developing/growing*, another old pattern taken from the observation of the growth of plants (organological view of education). Learning is *self-formation*, but it is continuously dependent on encounter and interaction with *tradition* from the past, *challenge* in the present, and *vision* for the future. This third pattern has been discovered in the younger evolutionary history in several stages of the Enlightenment, in which humans learned to attribute effects of their behaviour and actions to themselves instead of to magic powers (education as dialectical interaction).

The last pattern has two intertwined sides and points to tasks beyond a developmentalism which overemphasises growth. In religious education, as in other fields of productive learning, children need initiations into the strange and unknown, into the difficult and the resisting. In a plural world they need the different in order to discover their own. In meeting other religions religious education becomes explicitly learning through difference, by surprise and amidst cognitive or emotional irritations. If teaching glosses over the differences between religions, learning becomes less productive. If the differences exceed the amount of new data which a child can work through, learning easily falls prey to superficial assimilation. Today religious education has to cope with a strong pluralism which should not be boiled down to

a weak one. In my view we need a hermeneutic and educational methodology of mutual recognition in truthfulness of the existing world religions in their specific identity (Nipkow, 1998).

Research in Religious Education

The following examples are taken from sources published in the German language, since empirical studies from the English speaking world are very broadly displayed in this Handbook by other authors. For introductory purposes see the *Zeitschrift für Pädagogik und Theologie* (57th ed. 2005, Frankfurt: Diesterweg), the *Jahrbuch für Religionspädagogik* (21st ed. 2005, Neukirchen-Vluyn: Neukirchener); for studies from several European countries see *The Journal of Empirical Theology* (since 1988).

In Germany the modernisation of RE began in the late 1950s with the application of historical-critical exegesis, and the notion of RE as interpretation. It was not until the late 1960s that empirical research started. At the end of the 1970s the first reception of cognitive-structurally based research on moral development took place, drawing on Lawrence Kohlberg. In the 1980s the reception of James W. Fowler and Fritz Oser followed (Nipkow, 1982; Schweitzer, 1987). At the same time the focus was extended also to general life-span studies. Today, studies on faith between modern and postmodern adulthood have been added (Schweitzer, 2003).

The turn to the administration of own empirical analyses began with the qualitative interpretation of the problems young people have with God-related religious issues (Nipkow, 1988). In the 1990s the own activities of children became the main focus: the exploration of religious images, in particular images of God, religious world-views of children, thinking in complementarity, the understanding of symbolic language, concepts of prayer, the development of interpretations of suffering, and the interpretation of Jesus Christ.

Other projects were the comparison of religious socialisation effects in family, youth ministry, confirmation classes and RE in schools, the positive or negative views held about RE as subject in the curriculum, the profile of Catholic RE, the attitudes of Protestant religious educators, a comparison of teachers in RE and ME, and the acquired knowledge about the Bible. As a consequence of learning as 'self-organisation', the 'child as a theologian' and 'children as exegetists' were investigated. This most recent branch of research is called 'Kindertheologie' (children's theology).

A rather new focus was the analysis of instructional interaction processes which were explored from two perspectives: developmental ones such as Fowler's theory, and that of 'elementarisation' (Schweitzer, Nipkow, Faust-Siehl & Krupka, 1995). The four-dimensional concept of 'elementarisation' (developed by K. E. Nipkow since the 1980s, continued and modified by F. Schweitzer in the 1990s) has been presented also to English speaking readers in the context of God, human nature and an education for justice and peace (Nipkow, 2003).

In sum, the fields of research mirror the tensions between the individual and religion, between the private and the public, between developmental and initiating processes, between individual search and burning social issues. More or less the European discussion moves in dialectical pattern of thought.

RELIGION, VIOLENCE AND RELIGIOUS EDUCATION

John M. Hull

Queen's Foundation for Ecumenical Theological Education, Birmingham

Introduction

The contribution which religious education might make to peace cannot be discussed without recognising the fact that religion itself is deeply involved in violence (Appleby, 2000; Ellis, 1997; Gorringe, 1996; Juergensmeyer, 2000; Lefebure, 2000). The number of terrorist organisations with a specifically religious orientation has increased steadily over the past couple of decades (Juergensmeyer, 2000, p. 6). Religion is associated either as a principal element or as an associated factor in a majority of the armed conflicts being fought today. Although events such as the attack upon the World Trade Centre in New York in September 2001 and the wars against Afghanistan and Iraq have focused the attention of the media on the role of Islam, the fact is that religious violence can appear in any of the great world religions. We may mention the several Sikh terrorist groups in the Punjab, Hindu extremist political parties in India, the Jewish anti-terrorist groups in Israel, and the right-wing Christian movements in the United States. Even Buddhism has produced the violent sect which released a deadly gas into the Tokyo underground in 1995 (Juergensmeyer, 2000, pp. 102–116).

It is clear that the predictions of the 1960s about growing secularisation have not been realised; on the contrary, since about 1970 there has been a world-wide resurgence of religion, including the activity of religion in public life (Armstrong, 2000; Kepel, 1994). This has included violence in the carrying out of religious/political objectives. The theory and practice of religious education with both children and adults must take account of these developments. Many studies have attempted to find common threads running across the violence of world religions. I will outline a number of theories about the relation between religion and violence, commenting upon the educational response in each case. Rather than taking case

studies of particular acts of religious violence I will deal with the theories from the point of view of the various disciplines within the social and religious sciences: phenomenology, evolutionary biology, anthropology, psychology, cultural studies and finally theology.

Phenomenology of Religion and the Roots of Violence

In his influential book *The Idea of the Holy* (1959), originally published in German in 1917, Rudolph Otto distinguished two aspects of the human experience of the sacred: the fascinating aspect of what Otto called the numinous and, on the other hand, the overwhelming, awe inspiring aspect. In the presence of the holy, people feel irresistibly drawn toward the beauty of holiness, while at the same time there is a sense of dread, of treading upon holy ground, of approaching the infinite. This distinction emphasises the essential ambiguity of religious experience (Appleby, 2000, pp. 28–30). It is both beautiful and terrible. The beauty arouses desire and the terrible inspires fear. These two aspects of the divine appear in the sacred literature of many religions: the Bible and the Qur'an regard God as infinite in mercy, never ending in compassion, always ready to forgive, yet One who is like a consuming fire, before whom one stands as in the presence of the authority of final judgement. In the experience of the mystic there is at once the sense of the gracious presence, and also the infinitely other, who dwells in unapproachable light, or who makes a home in thick darkness.

Such descriptions immediately lead us into an understanding of the emotions of the true believer. When God commands, God must be obeyed, even if it means that the ethical must be suspended. The demand of the Creator is beyond good and evil. The laws of God are beyond discussion, beyond reason. Because they are founded upon the absolute difference between the creature and the Creator the laws of God cannot be qualified or evaded. This leads to what has been called 'terror in the mind of God' (Juergensmeyer, 2000). We shall return to this feature of religion when we come to discuss the theological contribution to our problem.

In turning to the educational implications of the phenomenology of the sacred I do not wish to give the impression that there is an obvious or easy educational approach which could alleviate the stark character of the sacred, or that even with young children teachers ought to dissolve the ambiguity of God into an easy familiarity. On the contrary, too much of our presentation of religion lacks a full and courageous confrontation with extremity. Let us not allow the majesty of the divine to become the comforting presence of a non-threatening niceness. In practice this means that both sides of Otto's phenomenology should be presented. This could be done through a module on religious experience, in which encounters with the divine can be shown in both aspects (Hull, 2002): Moses takes off his sandals; Paul is thrown off his horse and blinded. The night sky speaks of the divine not only in that it fills us with a sense of wonder and awe, but in that it drives us with a shudder back from its eternal silence into the comfort of our living rooms.

Evolutionary Psychology and the Origins of Religious Aggression

Evolutionary psychology has been described as the new science of the mind (Buss, 1999). It has been created as a new discipline in recent decades through a combination of ethology (the study of the adaptation of living creatures to their environment), prehistory (our increasing knowledge of the hundreds of thousands of years of hunter/gatherer society before agriculture and city life emerged) and brain research. The brain can now be understood as the product of millions of years of evolution, and traces of the situations to which thousands of generations have adapted may still be found in the brain (Stevens and Price, 2001, pp. 3–10).

For example, there are approximately 4000 species of mammals but aggressive male gangs appear in only two. In these, there is strong male bonding leading to the formation of marauding groups bent upon attacking and if possible killing members of rival male gangs. The two species are human beings and chimpanzees. There is considerable aggression, mostly male, in many species, but only in chimpanzees and men have these closely knit, organised bands been found. They are usually led by a powerful, dominating individual (Buss, 1999, pp. 278–279). In most bisexual species males are in competition with each other for females, forming hierarchies of male groups, each in conflict. Male bonding, in other words, may be interpreted as an adaptation to intense competition (Badcock, 2000, pp. 165–166). If we stay together we might finish up with something, but if each of us fights alone we will all be killed.

To the phenomenon of male aggression must be added the new interpretation of religious origins offered by evolutionary psychology. The hunting/gathering group of people probably consisted of no more than about 40 individuals, 8 to 10 males, 15 to 20 females and the rest children. As the group grew larger, a point would be reached when it was no longer viable within the resources of the tribal territory. It would have become necessary to gather food further and further from the home base and the hunters would be away for days, exposing the women and children to danger. A crisis might have arisen when the group numbered about 100. The group would then divide, about one third or half of the members attaching themselves to a new leader and moving off to settle a new area. The role of the leader in such tribal splitting would almost certainly be religious—the leader would be a prophet, a shaman, someone imaginative enough to conceive of a new life, a new horizon, and with the personal magnetism to inspire others to the point where they were prepared to abandon their homes and break away. No doubt sometimes this was accompanied by violence, but at other times it may have been peaceful (Stevens and Price, 2001, pp. 147–149).

If religion served this adaptive function in early human societies, enabling survival through the formation of new groups, it is not surprising to find religion still doing this today. Religion binds people together, gives people courage to resist, leads people on long marches, overland treks, to found new societies based on new mythologies. Religion may have been born in conflict and separation, the counter-parts of bonding and solidarity. If I am in solidarity with you, then we are distinct

from them. The distinction between us and them, those for us and those against us, the true god and the false, the faithful and the infidels—such distinctions are typical features of religion.

An educational response would suggest that we should teach more from an anthropological perspective (Nipkow, 2003, 129–142). Prehistory is not finished yet. The fact that in England and Wales religious education has come to consist almost entirely of studies of the modern religions has driven the study of primal religion from the curriculum, and our students are no longer able to understand religion developmentally, symbolically or topically (Hull, 1995a). The role of the vision, ritual, pilgrimage and evangelism is insufficiently understood unless such activities and beliefs are seen to be founded upon features of elementary religion (Nipkow, 2003, pp. 85–98). We should help our pupils understand that the roots of religion go very deep into human life, and meet basic human needs. This need not diminish the stature of religion in the eyes of students, nor on the other hand will it necessarily make religion more attractive. But it will impart a deeper understanding of religion and it will certainly make the study of religion more interesting.

Anthropological and Sociological Perspectives on Religious Violence

We shall now consider René Girard, probably the most influential scholar writing on religious violence in recent years. Girard is an anthropologist but uses primal materials to throw light on contemporary social problems, and he is also a brilliant interpreter of mythology and sacred literature. Girard distinguishes between biological desire and socially stimulated desire. Human desire is not satisfied when basic biological needs for food, reproduction, shelter and security are met. There is a kind of desire, perhaps not unique to humans, a non-biological, purely general desire, which is stimulated and shaped by imitation. We desire what we see others desire, and if we admire other people, our desire for what they want is all the sharper (Girard, 2001, pp. 19–31; Hammerton-Kelly, 1992 pp. 92–94). Thus we model ourselves upon an admired person, shaping our longings by what the model desires. Many a man has found his wife more attractive when he finds out that another man desires her, and the pleasure of winning a prize is diminished if it is realised that yours was the only entry. The model quickly becomes the rival, because he or she stands in the way of our possessing what we both want. Desire for the object then turns into resentment against the one who has it already (Hammerton-Kelly, 1992, pp. 19–24).

In a society of symbolic merchandising, where there is so much to desire and so many people who have many desirable things, intense competition is stimulated. This is whipped up by advertising and by the spectacle of consumption. We want the fun that we see others having, and often the reason we want it is no more than that others have it. We compare ourselves with others and want what they have. Competition spreads out like waves across society, driven by envy (Hull, 2001). Finally, this will lead to violence. Girard uses the symbol Satan to describe this social process (Girard, 2001, pp. 182–183). At this point, something happens. The

violence is turned away from society itself toward a group or an individual who becomes a scapegoat. This will be a group or person who already stands out in some way, already weaker, marginalised; and all the disappointment and frustration of society is discharged upon the scapegoat, who is expelled or killed. Social tension is released; the boil has burst. People are at peace again, temporarily united in the satisfaction of having expelled the source of the evil in their midst. However, the cycle will soon begin again.

Girard believes that the sacred literature of the world reveals these features of competition, violence and scapegoating (Girard, 2001, pp. 61–70). The Christian faith, however, is an exception. In other religions the mechanisms of scapegoating are invisible and therefore exercise an uncontrollable fascination, but in the story of the crucifixion of Jesus, the mechanism is revealed (Girard, 2001, pp. 103–120). Instead of the scapegoat being regarded as evil, the documents emphasise the innocence of the victim. In the New Testament Pilate and Herod become friends when the death sentence has been passed upon Jesus. The cycle of envy and violence is broken when we identify with the innocent victim and not with the competitive society. As Christians die with Jesus Christ, a reversal of values takes place (Hammerton-Kelly, 1992, pp. 68–71). When enough people realise the way the mechanism works and are delivered from its power by identification with the victim there will be no more victims. The need for violence, and the religious character of violence, will have vanished (Hammerton-Kelly, 1992, pp. 180–182).

The educational implications of Girard's approach are suggestive. His work stimulates our study of the role of money in our culture and the function of symbolic commodities in shaping the dreams and desires of our children (Hull, 1999). We are reminded that education of the emotions, especially the emotions of desire, are important in religious education. Girard offers new perspectives on the significance of the death of Jesus, enabling us to escape from the slogan 'Christ died for our sins', an idea that is often not explained, or only explained in terms no longer meaningful. The result is that the notion becomes sentimental and merely repetitive, but the insights of Girard may help young people to realise that in a contemporary sense the scapegoat is always suffering for the sins of society. Girard also throws light upon much religious mythology, although his negative attitude toward other religions seems exaggerated and opportunistic (Lefebure, 2000, pp. 29–30).

The Psychology of Religious Violence

Much conflict between human beings and societies can be understood as a clash of identities, precipitated by a challenge to identity, or a defence against a weakened, confused, or broken identity. Religion is a powerful source of identity, and this can give rise to conflict. The writings of Ruhullah Khomeini (1902–1989) offer insights into the self-understanding of a great religion when it has lost its identity, or is perceived to have been humiliated and fragmented by secular and alien forces. There is a vivid moment in his thought when Khomeini grapples with the saying of Jesus, whom he reveres and admires, about the possibility of non resistance to

violence. 'This idea of turning the other cheek has been wrongly attributed to Jesus (peace be upon him). It is those barbaric imperialists that have attributed it to him. Jesus was a prophet, and no prophet can be so illogical' (Khomeini, 1985, p. 219). 'Is it possible that such a person could utter such apathetic, cowardly words?' (Khomeini, 1985, p. 225). Such teaching, Khomeini concludes, has made Christians passive towards their capitalistic governments. Religions can become violent when their political identity becomes strong as well as when it has become disintegrated. The history of violent conversion and forced baptism of the European church in the medieval and colonial periods illustrates this, and lends weight to Khomeini's charge that Christians have betrayed and corrupted the teaching of Jesus.

Erikson distinguished between the identity of totality and the identity of wholism (Erikson, 1968, pp. 80–81), and we may compare these types of identity with exclusive and inclusive types of religion. There is a kind of religious identity that feeds upon dichotomy, the saved and the lost, the elect and the damned, the true and the false, the revealed and the natural, the heavenly and the earthly. The narcissistic psychology of Heinz Kohut (1971) has shown how a weak self-image can be bolstered through identification with an all-powerful divinity. Believers know that although they are unworthy, they are chosen by God. This knowledge brings about a transformation of identity, but when this is expressed in terms of us and them, religious experience begins to take sectarian forms. If a religious group feels itself to be under threat the source of the danger may be demonised, which is one aspect of delirious perception (Gabel, 1975, pp. 14–15).

It seems likely that the shock to the American identity caused by the events of September 11th 2001 and the subsequent sense of vulnerability led to a kind of delirious perception of enemies, whether real or imaginary, such that evidence was selected, mis-interpreted and even perceived in documents where it would not otherwise have been noticed. Delirious perception supported by the piety of religious fervour was a contributory factor in the otherwise inexplicable execution of a war against a country which had not invaded the United States, had not threatened to do so, and whose potential to do so was unclear. Delirious perception may also account for at least part of the sense of oppression and outrage felt throughout the Islamic world at the domination of a Godless secular culture (Kepel, 2002). These aspects of identity do not imply that the United States was not vulnerable, nor that parts of the Islamic world did not have real grounds for complaint, but the religious character of a dichotomised world view does become delirious in times of conflict, and leads to a spiral of violence. The other is no longer perceived as human but as a devil. In the Iraq war, both the president of the United States, George Bush, and the president of Iraq, Sadaam Hussein, invoked the name of God, and described the opponent as evil and even demonic.

When negative images of the religion of others are used to bolster the threatened identity of religious individuals or groups, we may say that religion has become Religionism (Hull, 1998). Erikson combined his psychological insight with his understanding of ethology when he spoke of pseudo-speciation (Erikson, 1968, pp. 41–42). Under threat, the tribe closes around its symbolic centres of identity and

power, becoming a kind of species within its species. People from other cultures and tribes are treated as if they actually belong to a different species: not even having our nature, not sharing the same kind of minds or souls as us. One can see this operating politically in situations of racist oppression, but the sense of religious mission on the part of the pseudo-species, those who are called out from the wicked mass, is often associated with a feeling of racial purity, giving racism a religious quality which makes it far more dangerous.

Religious education can make a contribution to understanding and perhaps restraining the occurrence of exclusive forms of religious identity, leading to greater toleration (Appleby, 2000, pp. 72–78). In order to do this with success a new kind of anti-religionistic religious education should be created, comparable to the anti-racist and anti-sexist kinds of education. In this respect we should examine the structures of an educational system and its curriculum. It is sometimes said that children should be educated in single-faith rather than in multi-faith groups. The single-faith group is said to protect and nourish identity whilst the child is young, and to offer a secure basis from which dialogue with others can be conducted later. On the other hand, it may be that religious identity is strengthened in multi-faith classrooms. Children may become more aware of their family tradition when they are taught alongside children from different backgrounds. No one doubts that religious communities are entitled to worship and to study together, and the parental right to bring one's children up in the family tradition is seldom challenged. However, when home, school and religious community offer a single context for the development of spirituality, one wonders whether there is enough possibility for a guided meeting with others.

Similar questions may be asked about the curriculum. Should religions be taught as enclosed systems, or should they be studied thematically, with more flexible boundaries? Should not children become familiar with more than one system of religion and value? The new emphasis upon teaching through the life-world of the child seems to possess clear advantages (Heimbrock Schielke and Schreiner, 2001). Life-world pedagogy contributes to citizenship education (Jackson, 2003) and tends to develop a critical faithfulness to one's own religious tradition, if any, combined with respect and even affection for others.

Cultural Theories of Religious Conflict

One interpretation of religious violence is that it breaks out under the influence of postmodernism, when cultural relativism seems to threaten the integrity of religion (Armstrong, 2000). It is useful at this point to remember the distinction made in the history of religion between primal religion, which is non-competitive, the world religions of the axial period (approximately 1000 BCE—1000 CE), which are highly competitive towards each other, and the post-axial religious period, when religions exist side by side, creating both unprecedented hostility and remarkable new forms of co-operation. It is suggested that the break-up of traditional ways of life, and the difficulty of achieving confident possession of the truth, is contributing

to a kind of identity mania (Meyer, 2001). This finds expression in the emergence of fundamentalist interpretations of religion, which claim to be the pure, residual kernel of faith, from which the majority of believers has departed.

The need for strong, uncontroversial guidance in a complex, baffling world draws people into these fundamentalist enclosures. The borders around these groups become very sharp, and although fundamentalist religions may collaborate briefly against what they see as the decadence and indifference of secularity, they must ultimately come into conflict with each other since their mode of relation to each other is that of conversion, not dialogue. The cultural conflict theory of Samuel Huntington (1996) argues that the nationalist politics of the nineteenth century, and the ideological politics of the twentieth, have been succeeded by the identity politics of the present day. The world is divided into six or seven cultural regions, in most of which religion occupies a central, defining role. The most significant of these is the distinction between the Christian West and Islam. This conflict has taken the place of the earlier competition between capitalism and communism. An irreconcilable gulf, according to Huntington, has opened up between Christian and Islamic cultures.

The school can do a great deal to prepare children for cultural variety, and religious education has an important part to play. Many schools have established links with schools in various cultural regions of the world. This helps schools to present a global curriculum and not merely a national one. Older students can become familiar with cultural theories, but the approach of Huntington, which sees religious conflict as inevitable, shows it can best be overcome by the common sense of human friendship. When you have experienced the honesty and loyalty of people from different religious cultures it becomes more difficult to believe that conflict is inevitable, and the superficiality of Huntington's approach becomes evident. The variety within each religion is just as striking as the differences between them (Meyer, 2001), and civilisations, like schools, become creative through sharing.

Theology and Religious Violence

Religious fanaticism, which may under certain conditions lead to violence, is a complex of psychological, sociological and other factors. Attempts to prevent the appearance of fanaticism or to help religious people to emerge from fanaticism tend to be ineffective. A principal reason for this lies in the religious believer's perception that nothing outside religion itself can sit in judgement over it. Thus the believer will not allow the social sciences to critique faith, and even reason itself is no match for the immediacy of the divine authority. In other words, the nature of unqualified commitment and the absolute character of the religious truth protect the believer from educational intervention, which may be regarded as coming from secular, humanist, or even godless sources. The techniques of religious studies and the methods of multi-religious education are no exception.

When they were told not to preach about Jesus, Peter and John replied that they must obey God rather than human authorities (Acts 4:19). This affirmation not only secures individual conscience, but also limits the power of the state, which can so easily assume divine authority over its citizens. As an example of this from more recent times, we might consider the interview Ruhulluh Khomeini gave Hamid Algar on December 29th 1978. Khomeini attributed the Iranian revolution to the traditional resistance of the Shi'ites towards political authority; whereas, he suggests, in the Sunni tradition there has usually been a tendency to submit to authority (Khomeini, 1985, p. 327). For people like Khomeini, the absolute quality of religious loyalty relativises all other claims. That is the liberating benefit of transcendence, but what is to protect individuals and cultures from the absolute claims of religion itself? The history of religious conflict in our generation makes this question urgent. Who is to relativise the relativisers? To criticise the ultimate critic? From what source of ultimate value is the absolute value to be evaluated? (Khomeini, 1985, p. 326–327).

These questions bring us to the heart of the problem of religion and terror. Is obedience to my religion such that I can be commanded to do anything in the name, and for the sake, of my religion? Is the survival of religion more important than the survival of people? And if the authority of religion is to be harnessed, reigned in by some other source of authority, will not religion lose its numinous quality, its transcendence? What can be more transcendent than the transcendent itself? If any attempt were made to relativise religion from outside religion, from secular or humanist points of view, religious believers might feel compelled to reject it. Although the social sciences and psychology may contribute to emancipation from fanaticism, their role is likely to be supplementary rather than fundamental. The reason for this lies in the fact that the religious believer may not acknowledge the legitimacy of any point of view outside religion as a source of critique over religion. Let God be God! Even reason itself is subordinate to the divine revelation, and fanatical belief fastens upon a select aspect of faith, relativising everything else in the faith to the supreme demand of a particular item within it.

The problem of religious fanaticism is thus essentially theological. This is understood in at least some of the literature where it is recommended that believers should be educated concerning the teachings of their own tradition on peace. It is frequently pointed out that the major religions all teach peace. However, it seems unlikely that selecting this apparently relevant content will succeed in diverting the fanatical mind from its purpose, for under certain conditions the peaceful purpose of religion may be suspended in the interests of the survival of the faith itself. A more radical theological approach is necessary.

Only theology itself can speak to this situation, for theology deals with the nature of faith from the inside. Nothing can judge faith but faith itself. Only faith can relativise faith. Most major religions possess internal criteria for self-transcendence. If the religious believer can realise the implications of continual self-relativisation, absolute allegiance is itself relativised. A faith which is relativised is less likely to become fanatical, while at the same time unqualified loyalty to faith is preserved.

Faith makes an absolute claim upon the believer, and the absolute character of this cannot be challenged. The believer will describe any such process as compromising or diluting the faith. It is therefore within absoluteness itself that we must find the way forward. But how can this be done?

Relative Absoluteness and Absolute Relativity

In religious faith the absolute can only be qualified by itself. Absoluteness when qualified by its own character becomes relative to itself. Religion responds to the transcendent, and only the transcendent can transcend itself. This principle of continual self-relativisation takes distinct forms within each religious tradition. Various religious systems may present different concepts of their inner relationship towards absoluteness, and may construe differently their position with respect to politics and power. Within Christian faith the character of this self-surpassing faith has been developed in different ways by two leading philosophical theologians of the later middle twentieth century: Paul Tillich (1886–1965) and Charles Hartshorne (1897–2000).

Charles Hartshorne

‘God is the not conceivably surpassable being’ (Hartshorne, 1967, p. 17). Hartshorne argues that the concept of God as being unsurpassable means that while God cannot be surpassed by anything else, God can surpass God. ‘God is the self-surpassing surpasser of all’ (Hartshorne, 1948, p. 20). For example, God’s knowledge expands as the increasing novelty in the universe means that there is always more to know, and God’s mercy abounds more and more as more and more people become objects of divine mercy. God is not static being but dynamic becoming. As the value in the world increases, God, as the one who encompasses all value, continually includes it, and so is always surpassing God.

Paul Tillich

Tillich regards the central principle of Protestantism as consisting of continual self-criticism in the light of continual reinterpretation of scripture. Indeed, he suggests, this is a characteristic of truth itself. ‘It [truth] stands critically over against every realisation, as is clearly understood by genuine Protestantism’ (Tillich, 1957, p. 14). The Protestant view of the church, for example, regards it as constantly standing under the judgement of the coming Kingdom of God, whereas in absolute views of the historical church, the Church itself partakes in the divine authority and is thus less available for criticism and less open to the truly new (Tillich, pp. 35–36). This principle of ‘self-transcending truth’ becomes a critical protest against all absolute claims. ‘The Protestant principle...contains the divine and human protest against any absolute claim made for a relative reality, even if this claim is made by a Protestant church’ (p. 163). This leads Tillich to expand his thought into a

philosophical distinction between the Unconditioned and human finitude. We never fully grasp the truth which has grasped us because the finite cannot fully comprehend the infinite (p. 163). Unless this principle is applied, religions themselves and ideologies become 'objects of belief and fanaticism' (p. 170).

Implications for Faithful Spirituality

These principles lead us to the view that whatever the contemporary interpretation of the Bible might be, or whatever our understanding of the divine will might be, it is always subject to continual revision. The fanatical mind believes that it has absolute possession of the divine, but when faith is better understood it is seen that faith is called to continual self-criticism. This has two results: the fanatical narrowing upon a particular thought is prevented by the knowledge that that point may not be as ultimate as one thinks, and the confidence of extremism is humbled by the thought that God is greater. The hand of Abraham, stretched out to slay his son, was arrested. No present attainment or conception or policy of religion can be given absolute priority over the mission of the religion itself. Nothing from the outside commands religion, and yet actual religion is continually relativised by its own inner principle and its ultimate goal. God is unsurpassable; unsurpassable that is by anything except God. Only the transcendent can transcend itself. Religion must continually relativise itself by surpassing itself. This approach can be articulated in several ways.

The Instrumentality of Religion

Religions must be regarded as instrumental, not in the sense that religion is to be utilised by art, culture or by the nation-state but in the name of the ultimate mission of all religion: life itself. Religions point to life, they direct human beings toward more abundant life; they represent the most highly developed systems and techniques for the spirituality that is the fullness of life. Just as an approach to spiritual development understands it as taking place through a series of self-transcending stages, so religion, one of the principal agents of human development, also advances by means of a series of self-surpassing modes.

The realisation of this may pass through three stages, and we can illustrate these by reference to three stages of an attitude towards a knife. First, it is believed that the nature of the knife is to be sharp. In the second stage, it is understood that the knife is sharpened in order that it may cut. In the third stage, it is seen that the nature or the mission of the knife is not lost in the process of its cutting but fulfilled. In other words, at first one may think that religion is absolute. It is for itself. This necessarily means one's own religion, one's own interpretation or experience of faith. Indeed, it is typical of religious experience to come home to one with an infinite otherness, creating a sense of absolute dependence. Nevertheless, religious experience does not exist for its own sake. When that happens, religious experience is fanaticised and faith itself becomes an idol (Babić, 2002).

In the second stage of religious insight it is realised that religion is for something; religion has its own intrinsic destiny and vocation. The human is not for religion, but religion is for the human and ultimately for the divine. The two sides of this expression highlight the ambiguity of religion with which this chapter began. Moreover, in suggesting this approach, I am aware that it must come under the same principle. This means that I cannot present this as a final solution but only as an intermediate approach which must be subjected to continual revision. In the third stage, one realises that one becomes true to one's religion by being false to it. Religion that continually surpasses itself is more faithful to itself than religion that always looks to its past achievements and its present situation.

Religion and the Believing Community

Here is another way of describing this situation. Muslims often speak as if Islam belongs to Muslims. The welfare of Muslims is identified with the mission of Islam. Christians often do the same sort of thing. People in church describe themselves as the people of God, and the church itself is often described by Christians as being the household of God. Christians often speak as if there was some particular advantage in being Christian, as if the Christian tradition was to serve the interests, prosperity, security and future happiness of Christians.

When people in a religion think like this, the religion is tribalised. When the interests of a religion are identified with the interests of the community that practises the religion, the result is religious communalism, religious tribalisation, and religious pseudo-speciation. The truth is that we, as a community, do not possess a religion. It is not the religion of *our* community, because we ourselves are more than members of our communities. The religion has us, and when religion takes possession of us, we are not called to serve the interests of religion only, but to share in the mission of religion. So in the first way of describing this situation, people are not for religion in the sense that narrow and exclusive religion does not have the right to claim absolute authority. In the second way of speaking of it, religion does not belong to people, in the sense that the religious community has no special command over the religion, which is greater than the community that bears its name.

Religious Borders, Uniqueness and Syncretism

In this third way of describing the situation, I shall speak in more explicitly Christian terms. When Jesus said that anyone who does the will of God is his brother, sister and mother (Mark 3:35) he was surely speaking like a Muslim, just as when Abraham believed God and it was counted to him for righteousness (Gal. 3:6) he was surely acting like a Christian. For if Christ died for all, then all are dead (2 Cor. 5:14). All have died, and in that common death there is neither Jew nor Christian, Muslim nor humanist, but a new humanity (Gal. 3:28). In these ways, Christian faith points beyond itself. This is not to suggest that one day a common religion will emerge. There are no hard and fast borders between religions, but I do

not anticipate syncretism either. On the contrary, as each religion is faithful to its vocation, the distinctive features of each may appear with greater clarity. Clarity and distinctiveness does not mean rivalry and competition. From a Christian point of view all things are ours, whether life or death, things present or to come (1 Cor. 3:22), whether plurality or post-modernity, all things are ours, and we are to live in and through them by the power of the Spirit, transforming them and disciplining them and ourselves toward the mission of God for life. This is not to say that 'ours' means 'ours as Christians' but rather 'ours as human'. Not only are all things ours, but we are Christ's, and Christ's is God's (1 Cor. 3:23), and when the end comes, Christ will yield up the kingdom to God, and God shall be all in all (1 Cor. 15:28). So Christian faith continually transcends itself.

These passages, indicating the subordination of the Son to the Father, are significant for this argument, and we could add 'the Father is greater than I am' (John 14:28) and many others. The paradox of absoluteness and relativity in this conception of Christ is also to be found in the doctrine of the Holy Trinity. Jesus Christ is subordinate to God his father, and yet within the Trinity God the Son is co-equal and co-eternal with God the Father and the Holy Spirit. As Son, he is both equal and not equal, and as a religion, Christian faith in Christ is both absolute and yet relative. The doctrine of the Holy Trinity may be thought of as the church's way of relativising Jesus, who cannot now become an idol, for God is also Father and Son and Spirit. Moreover, the Trinity itself cannot become an idol, or perhaps we should rather say that our understanding of the Trinity cannot become an idol, for the Trinity is a future Trinity, one that was, and is, and is to come (Hull, 1995b).

A similar logic of self-transcendence is probably to be found in all sophisticated religions. In Islam, for example, the affirmation that God is great may suggest that God is greater than our thoughts of God, or our obedience to God as we presently understand it. Similarly the concept of the oneness of God, which is central in Islam, may indicate some such process. The realisation of the divine unity is always ongoing and never complete. Moreover, the very nature of the Qur'an demands a process of continual interpretation. 'The Qur'an is not a book that someone can interpret comprehensively and exhaustively, for its sciences are unique and ultimately beyond our understanding' (Khomeini, 1985, p. 365). Therefore, one can only offer 'a possibility, not a certainty' (Khomeini, 1985, p. 366). This is the basis of the idea of the many veils that cover the Qur'an, each one leading to a deeper truth, and 'God has seventy thousand veils of light and of darkness.' 'Veils of light are no less veils for being composed of light but *we* have not even emerged from the veils of darkness' (p. 396). Even the central idea of Islam, the unity of God, may become a veil.

A religious faith which does not possess or cannot develop a concept of self-transcendence whereby it relativises itself in the name of its own mission is bound to become a veil or a fetish. Then the particularity of a given religion becomes absolute, and the way is opened up for fanaticism and terror. If we can teach our children this understanding of faith, whether we are Christian, Muslim or some other, we will prepare our children not only for loyalty to their own traditions,

but for contributing to the peace and welfare of humanity. But if not, if we are tempted to teach absolute and unchanging faith, the full implications of which we think we realise, then faith will become a fetish, and education will no longer be an instrument of peace.

CATHOLIC CHURCH DOCUMENTS ON RELIGIOUS EDUCATION

Dr. G. P. (Joe) Fleming

Religious Education Consultant, Australia

Introduction

In the discourse about religious education in the Catholic Church one of the greatest difficulties has been with language and definition. The meanings of terms such as evangelisation, catechesis, religious education, education in religion, religious studies and religious instruction are confused, often lack clarity, and at other times are used with contradictory meanings. Moran (1971, 1983, 1984, 1989) has been a consistent voice in the debate about the language of religious education, and the difficulties that are faced in developing a systematic and cohesive language. The issue of language, Moran argued in 1971, had reached the point where there was a crisis of religious education that emerged ‘from the relationship between the two words *religious* and *education*’ (Moran, 1971, p. 18). He concluded in the late 1990s:

Despite the term’s limitations, I do not know a better term in English to refer to all the possible relations between religion and education (Harris & Moran, 1998, p. 7).

Other researchers have echoed Moran’s concern about the language of religious education. In the USA, Boys referred to the language issue as being ‘characterised by endemic confusion and conflicting directions’ (Boys, 1982, p. 128). In the United Kingdom, Nichols commented on the confusion between the language of catechesis and religious education and stated that ‘catechesis is a square peg in this educational hole’ (Nichols, 1979, p. 17).

A number of simple steps can be taken to help an accurate reading of the texts about religious education. The reader needs to be clear about the authorship, purpose and context of the particular document being read. For example, both *Gravissimum Educationis* (1965) and *The Catholic School on the Threshold of*

the Third Millennium (1998) have a focus on catechesis and religious education in a broad sense. A critical factor to keep in mind, apart from these two documents being thirty years apart historically, is that *Gravissimum Educationis* is addressed to the broad educational mission of the Church and parish, and that *The Catholic School on the Threshold of the Third Millennium* is addressed to schools. Therefore these documents have different audiences, purposes and meanings.

While different documents use the same term, e.g., catechesis and religious education, the context in which the term is used may require an adjustment of meaning and interpretation. For example, when 'catechesis' is being used in the context of family life it has a different meaning from the same term being used in the classroom teaching of religious education. There is a need to be careful of the uncritical transference of terms from one context to another, thus making the assumption that there is a single meaning to the term. Understandably the broad focus of Church documents is the mission of the Church in the world and its commitment to evangelisation and catechesis. Catholic schools throughout the world are an extraordinary example of this missionary activity, and are therefore, by implication, places where evangelisation and catechesis can take place. Nevertheless, the question needs to be raised whether the terms evangelisation and catechesis are the most appropriate to, or are synonymous with, a theory and practice of religious education as it occurs in specific classrooms.

An Analysis of Selected Documents on Catechesis and Religious Education in Catholic Schools

Commonly Cited Documents

The literature of religious education reveals that the following documents are regularly cited as important documents in the development of religious education theory (Ryan, 1997; Malone, 1992; Rummery, 1980; Regan, 1999). This analysis seeks to determine aspects of religious education as contained in the documents that are of most relevance for the development of a theory of religious education for Catholic schools.

The Declaration on Christian Education, Gravissimum Educationis (GE) – 1965

The Declaration on Christian Education, *Gravissimum Educationis (GE)*, was promulgated in the last session of Vatican II in 1965. The use of the term 'Christian' in the title denotes an ecumenical perspective on education and reflects the intent of Vatican II to address its message to a broader audience than just members of the Catholic Church. Bracketing the word 'education' with Christian is an indication of the importance of education within a quest for faith.

In his commentary on GE, G. Carter stated that in it ‘the Church comes directly to grips with the problem of formal education, particularly in schools’ (1966, p. 634), as opposed to education within a broader Church context. Carter adds that GE ‘deals only with a few fundamental principles and that a more developed point of view is being left to a special post-concilia Commission and to the Conferences of Bishops’ (p. 634).

A theoretical understanding of religious education is not referred to separately in this document but rather exists almost as a sub-category within a broad definition of education. GE argues that all people have a right to education and that:

...true education aims at the formation of the human person with respect to his [*sic*] goal, and simultaneously with respect to the good of those societies of which, as a man [*sic*], he [*sic*] is a member, and in whose responsibilities, as an adult, he [*sic*] will share (Abbott, 1967, par. 1).

These dimensions of religious education are not restricted to schooling, but are seen more generally as part of the Church’s mission to announce ‘salvation to all men [*sic*]’ (Abbott, 1967, par. 3). Religious education is more than imparting knowledge merely for knowledge’s sake. It is an aid to salvation. Significantly, however, there is no mention of the content and methodology of religious education. The preparation of content material in religious education is seen as the task of the local bishop. There is also an absence of the words and concepts of ‘evangelisation’ and particularly of ‘catechesis’ that proliferate in other Church documents. The focus here instead is on broad, general principles of Christian education.

Some sections of GE relate to the role of the teacher and as such build a broad theory of this role in a Catholic school (pars. 8–9). It is important to note that the document refers to all teachers and there is no specific mention of the religious education teacher. It is stated that the role of the teacher is vital—so vital in fact that, in the view of GE, it is all teachers who ‘determine whether the Catholic school can bring its goals and undertakings to fruition’ (par. 8). Furthermore, reference is made to the necessity of having teachers in the role who are certified and have the qualifications that are necessary for the task. Finally, in relation to teachers it is stressed that they give witness by the ways in which they live and teach. The act of teaching is one of witness, and it implies a synchronicity between the message and the messenger. The implication contained in the term ‘witness’ suggests that the teacher is more like a ‘catechist’, one who shares faith and the faith journey with students and is a fellow believer. Such implications raise serious questions relating to who teaches and coordinates religious education in Catholic schools, as well as the purpose of religious education itself.

In constructing theoretical understandings of the role of a school, the document proposes that all schools ripen ‘the capacity for right judgement’ (par. 5). They provide ‘an introduction into the cultural heritage won by past generations’ as well as promoting ‘a sense of values’ (par. 5), and prepare students for ‘professional life’ (par. 5). In addition to the pursuit of cultural goals that are common to all schools,

the Catholic school is 'distinctive' as it tries to create 'an atmosphere enlivened by the gospel spirit of freedom and charity' (par. 8).

On Evangelisation in the Modern World, Evangelii Nuntiandi (EN) – 1976

The document on evangelisation was promulgated more than ten years after Vatican II. Thomas Walters claimed that this 'exhortation is the first church document devoted entirely to the topic of evangelisation' (Walters, 1996, p. 150). EN was written in response to the 'profound changes of present-day society' (par. 14) and described the task of evangelisation as 'proper to the Church, her deepest identity' (par. 14). In particular, EN explores the cultures in which evangelisation takes place and the need for the Church to work with and within the culture. It seeks to balance respect for the tradition of the Catholic Church with the needs of the culture within which the tradition resides (par. 67). This engagement of the Church with the world, and a recognition that the Church exists within particular cultures of the world, had been promulgated in the *Pastoral Constitution of the Church in the Modern World* at Vatican II. EN represents the continued search by the Church to communicate and dialogue with an increasingly secular society.

A critical point is the connection that EN makes between evangelisation, catechesis and religious education. Evangelising is defined as 'bringing the Good News into all the strata of humanity' (par. 18) while its purpose is 'interior change' (par. 18). This theory of evangelisation is exercised in the preaching of the good news, the gospel, to all people, and is an invitation to all people to respond in faith. Traditionally the term 'evangelisation' was applied to missionaries who went to 'non-Christian lands' and who gave witness in deed and word to the person of Jesus. EN expands that concept of Christian evangelisation and applies it to all people as part of their ongoing journey of life. All people are called to be witnesses to Jesus (par. 21).

Further dimensions of the term 'evangelisation' in EN include catechetical instruction and religious instruction:

A means of evangelisation that must not be neglected is that of catechetical instruction. The intelligence, especially that of children and young people, needs to learn through systematic religious instruction the fundamental teachings, the living content of the truth which God has wished to convey to us (par. 44).

EN links evangelisation and catechetical instruction to systematic religious instruction of young people within the broad cultural, evangelical and missionary activity of the Church. EN further argues that catechetical instruction is broader than schools and refers specifically to what occurs within the Church and within homes (par. 44). However, a less than careful reading of the text could lead to the conclusion that evangelisation and catechesis is the primary task of religious education in schools. There is a link between these areas of religious education, but they are not synonymous.

Catechesis in Our Time, Catechesi Tradendae (CT) – 1979

Pope John Paul II promulgated *Catechesi Tradendae* (CT) in November 1979. Historically this document emerged from the Fourth General Assembly of the Synod of Bishops in October 1977 with the theme of catechesis in relation to children and young people. CT was an ‘important landmark in the history of the post war catechetical movement’ (Rummery, 1980, p. 27), because it was a document solely directed to this chief work of the Church, namely, catechesis. CT is almost entirely devoted to issues of the broader Church with only one section of the seventy-three relating to schools. This is not a document where the religious dimension of schools is central, nor is it a document where religious education curriculum is expanded, or a theory of religious education is developed.

Because ‘catechesis’ is a word that is often misused in connection with religious education, care needs to be taken to determine what this document says about catechesis. Similar to evangelisation in EN, catechesis in CT is much broader than schools and is a term that applies to the total educational mission of the Church. In the opening paragraph the historical understanding of catechesis is made explicit: the ‘Church has always considered catechesis one of her primary tasks’ (par. 1). Catechesis was the name ‘given to the whole of the efforts within the Church to make disciples, to help people to believe that Jesus is the Son of God’ (par. 1). In this sense, all of what the Church does is catechesis.

The primary setting of catechesis is the parish: ‘It is true that catechesis can be given anywhere, but I wish to stress...that the parish community must continue to be the prime mover and pre-eminent place for catechesis’ (par. 67). While parishes are the primary places for catechesis, CT takes into account other diverse places where catechesis could be supported, such as chaplaincies in state schools and Catholic educational institutions (par. 67). The role of the religious education curriculum in the schools is to support catechesis, not to be a substitute for it. Nevertheless, the document returns to emphasise that the central place of catechesis is the parish: ‘In short, without monopolising or enforcing uniformity, the parish remains, as I have said, the pre-eminent place for catechesis’ (par. 67).

CT also reinforces the links between catechesis and evangelisation. Catechesis and evangelisation ‘have close links whereby they integrate and complement each other’ (par. 18), and between which ‘there is no separation or opposition’ (par. 18). Evangelisation is the first step of the process that leads to catechesis:

To put it more precisely: within the whole process of evangelisation, the aim of catechesis is to be the teaching and maturation stage, that is to say, the period in which the Christian, having accepted by faith the person of Jesus Christ as the one Lord, and having given him complete adherence by sincere conversion of heart ... (par. 20).

CT also states that ‘the specific aim of catechesis is to develop, with God’s help, an as yet initial faith, and to advance in fullness and to nourish day by day the Christian

life of the faithful' (par. 20). Following the directions of CT itself, catechesis occurs pre-eminently in parishes and families.

A further point in CT relates to the methods of catechesis, and is influenced by educational insights at the time the document was written. The methods by which catechesis is undertaken require 'revision', a 'search for suitable language' and 'the utilisation of new means of transmitting the message' (par. 17). In addressing the controversy of the time over traditional or life-centred approaches to catechesis the document is clear: 'Nor is any opposition to be set up between a catechesis taking life as its starting point of departure and a traditional, doctrinal and systematic catechesis' (par. 22).

CT also examines the place that catechesis has in a Catholic school. In relation to catechesis the document says that 'together with and in connection with the family, the school provides catechesis with possibilities that are not to be neglected' (par. 69). One of these possibilities lies within religious instruction:

The special character of the Catholic school, the underlying reason for it, the reason why Catholic parents should prefer it, is precisely the quality of the religious instruction integrated into the education of the pupils (par. 69).

The term 'catechesis' should not be uncritically transferred from its rightful context within parishes and substituted for 'religious education' in Catholic schools. The interchanging of the terms without regard for their different contexts has resulted in an inappropriate understanding of the purposes and nature of religious education as it relates to Catholic schools.

Documents from the Sacred Congregation for the Clergy

Content of the GCD

Historically this document is the first attempt after Vatican II to systematically reformulate the goals of the Church in relation to religious education. It expresses clearly that the task of the teaching Church is catechesis, and it sets out the content of catechesis. The 'intent of this Directory is to provide the basic principles of pastoral theology' (Foreword, p. 1) rather than to present doctrinal theology or a systematic expression of beliefs that are more appropriate to a Catechism. Pastoral theology and the practicalities that emerge for Catholic schools are the responsibility of the local bishop.

Catechesis (pars. 21–23) is aimed to bring individuals to maturity of faith and to deepen their conversion and witness to the faith. The people involved in the task of catechesis, namely catechists, as well as leading a life of witness, must also be competent in what they do. The GCD recognises the impact that developments in specialist fields of knowledge have on catechesis, and urges catechists to 'use the help which can be given by the sacred sciences, theology, Bible studies, pastoral thought and the human sciences' (par. 9). Drawing upon this knowledge, the catechists can select a pedagogical method that takes into account the life

circumstances of those being catechised (par. 46). As catechists they function as agents in the socialisation process with the primary aim of promoting faith and commitment. What is at issue here is the degree to which religious education teachers in Catholic schools should be called 'catechists', and the degree to which they are more suitably called 'religious education teachers'.

The GCD's primary focus is the pastoral dimension of the Church, as well as the role that catechesis plays in the educational dimension of the Church. Of far less concern in this document is education within the context of schooling. In the index of the GCD there are only four references to education, and one to schoolchildren. The GCD's theoretical framework is catechetical and not educational. This is evidenced most strongly in the term that is used in the GCD for those involved in catechesis, and that is 'catechist'. This is a Catholic Church term used to denote activities in parishes. In school educational settings the term 'teacher' is used for those involved in religious education. These terms imply vastly different processes and assumptions, should not be considered the same, and should not be used interchangeably. Furthermore, the terms 'evangelisation' and 'catechesis' as they are used in the document imply, and call for, a faith response, a conversion. It is questionable whether within the restrictions of the school classroom such responses are possible or suitable. On the other hand, one of the strengths of the document is its view on pedagogy in religious education:

The Directory refers repeatedly to the need to teach a traditional truth in a modern and scientific and pluralist world, through creative structures, and to teach not merely by repeating ancient doctrine but rather adapting it to new problems with a growing understanding of it (Welbourne, 1995, p. 104).

The document encourages the use of varied methodologies that have grown out of new understandings and does not intend to limit the methodologies to the method used in Catechisms.

The General Directory for Catechesis (GDC) – 1997

The rewriting of the 1972 directory in 1997 provided an occasion for the Congregation of the Clergy to incorporate the directions of the documentary heritage of the previous twenty-five years. The 'Preface' to the GDC stresses that one of the aims of the directory was to strike a balance between two principles that were to be found in other Church documents. The two principles were 'the contextualisation of catechesis in evangelisation as envisaged by *Evangelii Nuntiandi*' and 'the appropriation of the content of the faith as presented in the *Catechism of the Catholic Church*' (pp. 14–15). It reiterated that, as with the previous directory, this document seeks to provide pastoral principles as guidelines for the production of national and diocesan directories and materials related to catechesis (par. 9). Similarly to the GCD, this second directory allocated only three paragraphs out of 291 to the nature of the religious education program of Catholic schools. Both documents have limited statements on religious education in schools. Consequently, it is clear from

both directories that the primary understanding of catechesis belongs to the whole life of the Church. Religious education in the classrooms of Catholic schools has, on the other hand, a small but important part to play in catechesis.

In the paragraph on the proper character of religious instruction in schools, the GDC articulates a clear description of the relationship between catechesis and religious education that was not present in the 1972 directory. This distinction, as will be illustrated in the next section of this chapter, is present in some documents written by the Congregation for Catholic Education after the first directory and was taken up by the Sacred Congregation for the Clergy in the new GDC.

The relationship between religious instruction in schools and catechesis is one of distinction and complementarity: 'there is an absolute necessity to distinguish clearly between religious instruction and catechesis' (par. 73). The reasons for the 'absolute necessity' to clearly distinguish the two are not given; however, the distinction is clearly stated:

It is necessary, therefore, that religious instruction in schools appears as a scholastic discipline with the same systematic demands and the same rigour as other disciplines. It must present the Christian message and the Christian event with the same seriousness and the same depth with which other disciplines present their knowledge (par. 73).

The articulation of the importance of the cognitive demands of religious education in schools and the need to present religious education with the same rigour as other subjects is a major advance on the first directory. The statement has drawn on documents produced by the Congregation for Catholic Education as well as the wealth of research into religious education that occurred in the period between the directories and which emphasised this aspect of religious education.

Documents from the Sacred Congregation for Catholic Education

The *Sacred Congregation for Catholic Education* has authority for seminaries, universities and schools. The various documents that this Congregation has produced for schools need to be seen as complementary to, but distinct from, other sources already surveyed. They fit within the Church's documentary tradition but have a particular focus on formal Catholic education as it occurs in schools and universities. They are written with a combination of educational and catechetical language, a point referred to by Veverka (1996) in his examination of the *Religious Dimension of Education in a Catholic School* and which applies to the other documents as well:

The literature of Catholic education emphasises a necessary and intrinsic relationship between religious formation and social, cultural and intellectual development. The language of catechesis reflects its biblical roots and pastoral orientation. The core principles of Catholic education reflect the systematic framework of neoscholastic philosophical sources (Veverka, 1996, p. 486).

The Catholic School (CS) – 1977

The first of the documents from this Congregation addresses the nature of a Catholic school, in language that draws upon GE. It devotes much attention to language that is used to describe the religious education process in schools. Drawing upon the concepts developed in EN this document recalls that:

...evangelisation is, therefore, the mission of the Church; that is, she must proclaim the good news of salvation to all, generate new creatures in Christ through Baptism, and train them to live knowingly as children of God (par. 7).

Schools are part of that mission of the Church, and as such can be places of evangelisation. Other sections of CS describe schools as places where the young are exposed to the world (par. 27), where they have the opportunity to develop ethical approaches to life (par. 30), and where values can be explored (par. 32). Teachers have a critical role in exposing faith dimensions to the young (par. 4).

The document explores the teaching of religious education, and presents a theory of religious education in schools which is not confined to religious education classes:

Without entering into the whole problem of teaching religion in schools it must be emphasised that, while such teaching is not merely confined to 'religious classes' within the school curriculum, it must, nevertheless, also be imparted explicitly and in a systematic manner to prevent a distortion in the child's mind between religious and other forms of education (par. 50).

CS differentiates religious education from catechesis and states 'that the proper place for catechesis is the family helped by other Christian communities, especially the local parish' (par. 51). However, CS articulates a connection between parish and schools similar to the GDC. Schools assist this primary catechesis when 'young people are helped to grow towards maturity of faith' (par. 51).

Absent from the document is any detailed reference to the formal religious education curricula, as it operates in schools. Limiting the discussion of religious education to the broad religious dimensions of school and not taking into account classroom religious education avoids the necessity of articulating a theory that seeks to balance religious education and catechesis. The document sets religious education within the broader catechetical perspective of the Church (Malone, 1992, p. 8) and does not expand on religious education as it occurs in classrooms in Catholic schools.

Lay Catholics in Schools: Witnesses to Faith (LCS) – 1982

One of the worldwide historical influences on the content of this document was the change from religious order dominance in Catholic schools to lay dominance, and the document commences with the recognition that lay Catholics in primary and secondary schools 'have become more and more vitally important in recent years' (par. 1). It is lay teachers, 'believers or not, who will substantially determine

whether or not a school realises its aims and accomplishes its objectives' (par. 1). The lay educators exercise a specific mission within the Church. They need to have the best possible professional qualifications and be inspired by faith (par. 24).

Explicit mention is made of a new description of an aspect of the role of the teacher, that of vocation. This is borrowed from the theology of religious life where women and men who responded to God's call were said to have a vocation, a calling. This language, once primarily associated with vowed women and men religious, has been transferred to include all teachers in Catholic schools: 'It is, therefore, very desirable that every lay Catholic educator become fully aware of the importance, the richness, and the responsibility of this vocation' (par. 37). Referring to the life of a teacher as a vocation, and stressing their role as witness, frames the teacher in church language, as opposed to their primary function as educators.

A critical insight that this document brings is the recognition that aspects of the teaching of religious education are not necessarily part of catechesis (Malone, 1992, p. 8). It commences by reiterating the principles in GE that religious education is actually a right of all people. LCS then clarifies the nature of religious instruction and its relationship to catechesis. It should not go unnoticed that this document represents a decisive turning point in the discussion about religious education and catechesis:

Therefore, the teaching of the Catholic religion, distinct from and at the same time complementary to catechesis, properly so called, ought to form a part of the curriculum of every school (par. 56).

This is the first time in any of the Roman documents that this distinction is made. What is meant by this complementarity, however, is not developed in LCS. It reflects the influence of the work of religious education theorists and researchers within the discipline of religious education who had been arguing since the early 1970s for this understanding of religious education in relation to schools.

The Religious Dimension of Education in a Catholic School (RDE) – 1988

The purpose of this document from the *Congregation for Catholic Education* was to provide guidelines for reflection and renewal for Catholic schools and those who work in them. The Congregation called on bishops and superiors of religious orders to reflect upon the impact of Vatican II. The title of the document indicates that this document examines much more than formalised religious education curriculum or religious instruction classes within schools. The 'religious dimension' is a much broader area and refers to all aspects of the life of the school; it includes all teachers, all subject areas, and all other elements intrinsic to the school curriculum.

In the development of the theory of religious education in schools RDE is the first document to provide a sustained and detailed proposal of an educational perspective, departing from the specifically catechetical perspective contained in many of the documents already analysed. It has significantly added to the theory developed in LCS. The term 'catechesis' as the preferred term for religious education, widely

used in CT, EN, GCD, GDC and CS, is rarely mentioned in RDE. In fact, the term is not used until part four of the five-part document (pars. 68–73). The purpose of the reference to catechesis at that point is to make a clear distinction between it and religious instruction:

There is a close connection, and at the same time a clear distinction, between religious instruction and catechesis, or the handing on of the Gospel message. The close connection makes it possible for a school to remain a school and still integrate culture with the message of Christianity. The distinction comes from the fact that, unlike religious instruction, catechesis presupposes that the hearer is receiving the Christian message as a salvific reality (par. 68).

RDE makes this distinction when it examines the aims and purposes of catechesis and education:

The aim of catechesis, or handing on the Gospel message, is maturity: spiritual, liturgical, sacramental and apostolic; this happens most especially in a local Church community. The aim of the school is knowledge. While it uses the same elements of the Gospel message, it tries to convey a sense of the nature of Christianity, and of how Christians are trying to live their lives. It is evident, of course, that religious instruction cannot help but strengthen the faith of a believing student, just as catechesis cannot help but increase one's knowledge of the Christian message (par. 69).

Moreover, the teacher, both professionally and personally, is cast as central to the effectiveness of this religious dimension (par. 96). More specifically, 'the effectiveness of religious instruction is closely tied to the personal witness given by the teacher' (par. 96). The 'witness' component of the teacher's role receives a prominent place within the document, as it does in other documents previously mentioned in this chapter. However, the prominence of the witness does not override the need to have suitably trained and qualified teachers: 'Everything possible must be done to ensure that Catholic schools have adequately trained religion teachers; it is a vital necessity and a legitimate expectation' (par. 97). In addition RDE expresses an understanding of the role of the school in relation to religious instruction. 'A Catholic school is not simply a place where lessons are taught; it is a centre that has an operative educational philosophy, attentive to the needs of today's youth and illumined by the Gospel message' (par. 22).

Schools deal primarily with students as they present themselves at school, but they also have a connection with what occurs in the lives of students outside the school. In RDE it is suggested that religious instruction needs to be linked with those areas of the students' lives that are outside the school: 'Finally, religious instruction in the school needs to be coordinated with the catechesis offered in parishes, in the family, and in youth associations' (par. 70). This is perhaps the clearest reference to the complementarity between religious education and catechesis, while at the same time highlighting their differences. Religious education occurs within the educational

settings of the classroom and utilises all the techniques and insights that educational theory and understandings of classroom practice permit. Catechesis occurs within the settings of families, parishes and voluntary associations where people gather for the purpose of the sharing of faith. Assumptions such as those implied in the catechetical approach cannot be easily applied to the religious education classroom in Catholic schools, yet they do support each other. Religious education leaves open and encourages the possibility of catechesis.

It is clear in this document that the realities of school life have been foundational to its articulation of theory in relation to religious education. The document recognises that the nature of schools has changed, that they are now more multi-cultural and pluralistic than ever before. There is also recognition that the nature of education itself has changed, and that religious education needs to draw upon those changes to be educationally valid. The mention of objectives, syllabus, links with other disciplines, promotion of culture, and use of best methodologies (par. 56) is a testimony to the ways in which this document is embedded in the world of school education and is attempting to address the needs of schools. Furthermore, 'this document is attempting to chart different territory from the catechetical documents' (Ryan, 1997, p. 174), focusing on the broad religious and educational dimensions of schooling.

The Catholic School on the Threshold of the Third Millennium (CSTM) – 1998

CSTM is the most recent of the documents from the Congregation of Education. It is an exceptionally small document (twenty-one paragraphs) when compared with all the other documents that have so far been analysed in this chapter. The document uses the onset of the third millennium to restate, in summary fashion, the principles of the Catholic school in the light of 'new challenges which are the result of a new socio-political and cultural context' (par. 1). Among those challenges are 'extreme pluralism' (par. 1) and 'rapid structural changes, profound technical innovations and the globalisation of the economy' (par. 1). In the midst of these changes, CSTM urges Catholic schools to undergo a 'courageous renewal' (par. 3) because of their 'fundamental duty to evangelise' (par. 3). Schools are described as having two functions: 'The Catholic school should be able to offer young people the means to acquire the knowledge they need in order to find a place in society which is strongly characterised by technical and scientific skill. But at the same time, it should be able, above all, to impart a solid Christian formation' (par. 8).

CSTM points out that there have been important developments and insights gained in the science of education and other areas of knowledge, but society has not been as devoted to 'the essence of education as such, centred on deeply meaningful values and vision' (par. 10). The document reiterates the connection between Church and school, and describes schools as places 'of ecclesial experience' (par. 15). Teaching within such a context 'has an extraordinary moral depth' (par. 19) and the person of the teacher is very important.

Conclusion

The documents surveyed in this chapter represent a wealth of material for those involved in the mission of the Catholic Church, particularly in the formal ministries of catechesis and religious education. Nevertheless the documents need to be approached with a critical mindset, in particular a mindset that is aware of the authorship, context and purpose of the documents. This mindset will not remove all of the complexities of language and will not result in a universally obvious and accepted theory of religious education for Catholic schools. However, being aware of these complexities is a necessary first step to a sufficient commonality of meaning.

FUNCTIONAL DEMOCRACY AND THE DEVELOPMENT OF DOCTRINE: A PARTICIPATIVE APPROACH TO RELIGIOUS EDUCATION

Dr. Graham English

Australian Catholic University, Strathfield, New South Wales

Introduction

There is a crisis of meaning in the Australian Catholic Church following the changes in the Church and Australian culture since the 1960s, and this crisis has an effect on religious education in Catholic secondary schools. There are many signs of this crisis of meaning but the most critical is the gap between the *institutional* aspect of the Church, the People of God gathered in Jesus' name, and the *organisational* part, the group of people who make the rules and see themselves as the leaders. This gap is particularly great between the organisation in Rome and the institution in Australia.

The problem is that there has been a change in the discourse of meaning in the Church, a profound ideological change, but the organisation and the institution have moved apart because they each have different theories about how understanding occurs. The organisation acts as if it believes that meaning can be reproduced and handed on unchanged. The People of God, those who are not officially part of the organisation, act as if meaning changes depending on the context.

The result is that the organisation and the institution have different ways of addressing the crisis of meaning, and different positions on how the crisis might be addressed. They have different hermeneutics. The organisation still relies on a conservative or reproductive hermeneutic that cannot adequately account for or deal with change, while the institution, the People of God, has *de facto* adopted a critical hermeneutic that can account for change and better cope with it. Many teachers, parents and students, without formulating or really understanding what they doing, have a significantly different way of interpreting their experience of life, and the Church, from those in the organisational Church.

This chapter is the beginning of a strategy for bringing the organisation closer to the institution, the ordinary People of God, by applying a suitable hermeneutic to religious education.

The Continuity of the People of God

One source of the crisis of meaning for Christian religious educators is the tension that arises from their need to address the religious needs of the students, and to help them find their individual calling, while at the same time seeking to maintain and develop the Catholic tradition. In the Catholic Church the Second Vatican Council (Vatican II, 1962–1966) proposed that an individual can have freedom within the believing community. This chapter proposes that both doctrine and individuals need to change if religious institutions are to continue over time. It focuses on John Dewey's (1916) approach to education via functional democracy, and John Henry Newman's (1845/1973) theory of the development of doctrine. It addresses the question: 'How does Dewey's functional democracy inform Vatican II's notion of individual freedom within the believing community?'

To have young people simply grow up physically and master the necessities of subsistence is not enough to ensure the continuity of the life of the group, because children are born unaware of, and indifferent to, the aims and habits of the group, and have to be both made aware of and actively interested in its life if it is to flourish (Dewey, 1916). To ensure continuity, enough of the young have to become willing members of the institution. Achieving this willing membership is one of the tasks of education (Dewey, 1916).

John Dewey defined learning as the solving of genuine problems in the biographical development of individuals, and the social development of the species (Dewey, 1916). Education is one way in which institutions and cultures solve the problem of continuity. This is as true of religious education as it is of all other education. A religious institution like the Catholic Church will continue only if its young are educated into a willing acceptance of its aims and the habits of the groups that constitute it. For Dewey, education is a process in which all members of the group, adults as well as children, learn all the time, thereby helping the group to survive and develop. Education for development precludes the possibility of mere rote learning; any community intent on flourishing needs an attitude to learning that celebrates the growing will of the student.

The Individual Vocation

One of the challenges in the biographical development of individuals arises from the question of how each is to live in the group according to who they are called to be. 'We live such a short time in this world, it seems a pity not to do the jobs we're suited for' (Powell, 1966). Catholicism sees this dilemma in terms of personal vocation, from the Latin *vocatus*, a summons or call. All Catholics, 'whatever their condition

or state, are called by the Lord, each in his own way to that perfect holiness whereby the Father Himself is perfect' (*Lumen Gentium*, 1965). Thomas Merton described a fellow Cistercian monk in this way: 'I know the integrity of this man is very costly to him. He suffers very much in order to be true to his own heart, that is to the heart God has given him, and which has in it a mysterious command that no one here is able to understand' (Merton, 1968). Newman's *Apologia pro vitae sua* (1869) is an account of his following his individual vocation. In a different mode he summed this up in a prayer that begins, 'God has created me to do him some definite service; he has committed some work to me which he has not committed to another' (Morneau, 1982). Newman became content that he was following his summons, but acknowledged in this prayer both that it is sometimes difficult to know what the summons is, and usually very difficult to follow it. So the prayer contains a line of ultimate trust, 'Whatever, wherever I am, I can never be thrown away'. Charlotte Beck's comment that transformation is 'to produce what life chooses to produce through us' is an acknowledgment that the task of being human is to live whom we are called to be (Beck, 1993). Her mingling of the concepts of vocation and transformation leads to the thought that education for transformation is education for vocation. The acceptance of the individual's vocation, that in the context of the community all persons are to follow the summons that they discern they are called to, is not some kind of wild individualism. It is openness to that which allows for the possibility of truth being found in unexpected places. And it is a way of keeping the balance between the continuity of the group and the freedom of each person within it.

Discerning the Summons

The call of the individual is only half of the story. Individuals exist only in communities, 'modes of associated living', that, if they are functional democracies, have authority through what Dewey labels 'conjoint communicated experience' (Dewey, 1916). This is part of the actual democracy that Dewey regards as a prerequisite for education. Here democracy is the commitment on the part of all to the ideal that, as far as possible, every individual is free to live a fully human life; that is, a life experienced as full of meaning and value (Garrison, 1995). Here Dewey is enunciating an approach to freedom that Pope John XXIII and Vatican II expressed much later, but it was not new in Catholic thought when they enunciated it, even if it was rarely practised. Writing in 1911, when the Catholic Church was still deeply fearful of the French Revolution and suspicious of the concept of functional democracy (Duffy, 1997), Belloc claimed that the political theory on which the revolution proceeded was universal. 'It is eternal, and it is true,' Belloc wrote, and added:

A political community pretending to sovereignty, that is, pretending to a moral right of defending its existence against all other communities, derives the civil and temporal authority of its laws not from its actual rulers, nor even from its magistracy, but from itself (Belloc, 1911).

The ideas of vocation and the moral right of communities to rule themselves lead to two commitments that together help avoid the traps of ideology and of self-delusion, of both theological imperialism and a post-modern disintegration of the unity of faith. The first is the commitment to disinterest on the part of all members of the community. The second is a commitment that the community will strive to hold in tension the beliefs that legitimacy lies first with the individual member of the institution (Saul, 1997), and second with the community or institution as a whole.

Both the individual's vocation and the community's need are part of the process of discernment. Disinterest calls on both individual and community to preclude that *ethnocentric* practicality 'in which the test of a good theory is whether it is developed in the interests of the group of which the theorist is a member' (Young, 1996). It calls us also to disdain that *egocentric* practicality in which the test of a good theory is whether it is developed in the interest of the developer. Disinterest is the opposite of ethnocentrism or egocentrism. If all members of the group are disinterested, that is, acting only for the well-being and continuity of the community, then each member of the group theorises, interprets and acts only in ways that promote the common good. In a sense they overcome plurality while at the same moment they honour it. It is part of what Dewey (1916) labels 'democracy', but it is a far cry from any form of mere majority rule and interest politics. This is *functional democracy* where disinterest tolerates, indeed welcomes, difference, provided it does not harm the common good. It acknowledges that a sign that the common good is truly being sought is that individuals are free to live out their vocation.

Disinterest can also make room for the members of the group to distinguish, for example, between acts and theories that are simple defiance or self-interest, and those that are part of the process of continued dialogue about the mismatch of teaching and experience. In Church terms, disinterest is a way to achieve true closure between the consciences of the People of God and the hierarchical authorities of the Church. As Merton was aware even a genuinely disinterested community cannot easily understand the 'mysterious command' (Merton, 1968) that God puts in some people's hearts or into the community. This ability to discern is necessary for both individuals and the community in an institution like the Catholic Church, which of its nature is given to teaching, and where the Pope and the bishops have a privileged place in decision making when they act as the interpretive authority. This leads to the kind of theory that can be the basis for real communication.

A Functional Democracy

Dewey chose functional democracy as the best milieu for education because it combines numerous and varied points of shared common interest in a society, with the recognition of mutual interests between participants. For Dewey democracy is, like the ideal speech situation of Habermas (in Young, 1996), an ideal that is useful for hopeful thinking. Democracy in Dewey's sense is a collective project that has

two particular features. The first is that there must be recognition of common ideals, and the second is that there must be a wide, flexible range of points of contact with other groups, enabling cooperation and communication (Garrison, 1995). The first liberates conduct and allows it to become participation. The other allows social action to be ready for change and to cope with change in a constructive manner (Garrison, 1995). In Dewey's democracy neither blind obedience nor rigid narrowness has a place.

A democracy accepts that change in social habits to meet new situations in a culture or institution is a good idea, and that this happens via individual participation (Dewey, 1916). Change is not only a good idea, but it is necessary for institutions to survive; not, however, by blending differences with one another, or by one group being submerged by another. Institutions that survive will change to the extent necessary for them to recognise differences, to acknowledge what is valid in different positions, to become tolerant of some degree of diversity and to discover some common ground which becomes the place of conversation, where understanding and cooperation can be built (Young, 1996).

This conversation has to take place in continuity with the classics, with the symbols, revelation and stories that gave them meaning in the first place. Any theory of hermeneutics to be of use in a Catholic context has to be preservative of old meanings as well as creative of the new (*Fides et ratio*, 1998). In other words, theories of use have to be those that will allow for and explain the development of old meanings into new ideas. John Henry Newman introduced this idea into Catholic thought in his *Essay on the development of doctrine* (1845).

Preserving the Old Meanings

The development of an idea, Newman says, is 'nothing else than its adequate representation and its fulfilment, in its various aspects, relations, and consequences' (Newman, 1845). In the process of establishing that development is possible in doctrine, Newman asked the question as to whether a particular representation of an idea was a corruption or a development. A corruption 'obscures or prejudices its essential idea' and 'disturbs the laws of development', or it 'reverses its course of development'. That is not corrupt which is 'both a chronic and an active state' or which is 'capable of holding together the component parts of the system'. The same question arises here: What must we demand of new expressions of Catholic ideas or new theories for explaining Catholic religious education before we can accept them as adequate expressions and fulfilment?

Preserving the Idea

Newman listed seven tests of a true development of doctrine. The first test is *Preservation of Idea*. This is a difficult test to apply to particular cases because it implies an insight into the essential idea in which a system of thought is set up,

and when this test is attempted it leads only to more theorising. Indirectly this is a warning that in Catholicism it is not possible to get everything clear. Catholicism is particularly unsystematic in its inspired documents and in the all but silence of the contemporary history of its foundation. There are many things about the essential ideas and the foundation of Christianity that are going to remain forever unclear and therefore they will be in need of interpretation.

This uncertainty makes for difficulties for Catholic interpreters, but it also provides the milieu in which institutional learning can take place. Newman shows that the nature of Catholicism is such that it has the capacity to learn as an institution. This is important because Catholic schools, like the whole institution of the Church, are part of the process of institutional learning. Schools play a part in the process of identity formation of Catholics, for example, and so have a role to play in the Church's learning, just as they themselves learn to be part of the expanding moral-political discourse of the Church.

Continuity of Principles

The second test is *Continuity of Principles*. The political principles of Christianity are laid out in the Sermon on the Mount, for example. 'Contrariwise to other empires Christians conquer by yielding; they gain influence by hating it; they possess the earth by renouncing it' (Newman, 1845). Principles are different from doctrines in that principles are abstract and doctrines relate to facts; doctrines develop while principles do not; doctrines grow and are enlarged while principles are illustrated. Principles do not develop; they are exemplified.

Doctrines are intellectual while principles are more immediately ethical and practical. For example, personal responsibility is a principle, while the *Being of God* is a doctrine. However, what is a principle and what is a doctrine depends as much on how we view them as anything else, so that what is a principle in one religion may be a doctrine in another. A development of doctrine, to be faithful, must retain both the doctrine and the principle with which it started. Principle, therefore, is a better test of heresy than doctrine. If people have the same principles, even if they have different doctrines, neither is a heretic, even if one is ignorant.

The Power of Assimilation

Some ideas more readily coalesce with certain others, and this is a sign that they have an antecedent affinity with them (Newman, 1845). This is Newman's third test which he calls *Power of Assimilation*. It is the sign of a great idea that it can become many while remaining one. While entertaining one aspect of an idea we always move in the aura of its possible meanings. Great ideas, Newman says, have an 'eclectic, conservative, assimilating, healing, moulding process' (1845) that he labels a unitive power. This power to develop is a proof of life in the idea. The stronger and more living an idea, the more powerful a hold it exercises on the minds

of people, and the more it can dispense with safeguards and trust itself against the danger of corruption. When an idea is living and influential and operative in the minds of its recipients it is sure to develop according to the principles on which it was formed.

Here Newman is exhibiting what Paul Ricoeur (1989) means when he speaks of imagination. Ricoeur talks of the hermeneutic act being one of sympathetically re-imagining the cosmic images of our foundational myths (Kemp & Rasmussen, 1989). Newman speaks of ideas, 'the great idea' in this case, where Ricoeur would insist that the cosmic myths, the object of our reflection and intuition, and so of our development, are symbols. Newman, like Ricoeur, has profound trust in the great ideas or myths of Christianity, and an awareness that over time they will look after themselves. In the end truth will out, but will never be complete. He continues with the observation that developments are usually only aspects of the idea from which they come, and it is often a matter of accident in what order they are carried out in individual minds. Some of these developments occur early but are not found until later, and then we realise that they are part of the original idea. They have been an intimation of things to come.

Early Anticipation

An example of early anticipation is the idea of human flight appearing in the human imagination hundreds of years before the technology that made it possible. In the light of the development of the internal combustion engine and other technologies, something which was once thought impossible or even evil, and the province of witches, becomes familiar and is regarded as good. Newman's fourth test is *Early Anticipation* (Newman, 1845), which means faithfulness to an ultimate development. At the time an early anticipation might be judged by some to be unfaithful, which is one good reason for authorities to be tentative in their denouncements, and why trust in the Holy Spirit is of the essential nature of discernment. This trust is expressed well in Chesterton's dictum, 'refuse to submit to the small and arrogant oligarchy of those who merely happen to be walking about' (1907).

A Logical Sequence

It does not matter in what order or degree of development the elements of an idea show themselves, but when they are all seen together it will be observed that there has been an orderly and gradual sequence. This is Newman's fifth test, *Logical Sequence*. He is not claiming that there is a conscious move from premise to conclusion; in fact he excludes this possibility arguing that it is more a discursive exploration. Newman is saying that ideas grow in the mind by remaining there, becoming familiar and distinct, and by linking with related ideas and gradually developing into a body of thought, without the thinker even recognising what is happening. Pre-understanding is a prelude to further understanding. This is as

important for religious educators as it is for the whole institutional Church, because we do not always know what stage of understanding we are in. We often have to take a risk that we will come to understanding. Just as an idea can gradually grow in the mind of an individual, so analogous development is a social project, not just the work of the individual. The whole institution participates in the act of inquiry at the present level of learning in the society, not always recognising what is happening, and with the potential to transcend that level (Young, 1998).

The trust that is necessary to such a process will eventually carry the organisation closer to the institution and bridge the gap of alienation. When Newman is discussing how ideas grow he is preparing the way for an explanation of how the Catholic institution joins in the hermeneutic tradition. Newman's ideas have to be expressed and acted upon at the level of learning communities, in a process of communicative action, if they are to be effective. This is why Newman's thought on development has implications for communication. He is, like Habermas later (in Young, 1996), providing a normative and a rational basis for social critique and for the development of meaning. His theory for the development of doctrine works only in a functional democracy. He is also illustrating the process of a theory based in hope that refuses to foreclose on the future.

It is surprising that, with Newman as part of their tradition, some of those fathers who prepared the first drafts of documents for the Second Vatican Council could think, for example, that the last word had been said on a Catholic approach to freedom at the end of the nineteenth century, and that this could be imposed on the faithful. It is even more surprising that any Catholic could think it now!

As part of this fifth test Newman notes that development always extends belief. Rationalism, on the other hand, contracts it. He observes that the spontaneous process that goes on within the mind itself is 'higher and choicer' than that which is logical. He summarises this test in the scriptural quote, 'By their fruits you shall know them' (1845).

Preservative Additions

Newman calls his sixth test *Preservative Additions*. Developments that are preceded by definite indications are quite likely to be acceptable, but those that contradict or reverse the course of doctrine are certainly corrupt. A corruption is a development in that very stage in which it ceases to illustrate, and begins to prejudice the acquisitions gained in its previous history. Hans-Georg Gadamer (1989) might have described this in terms of a development that, rather than fusing the horizons, snaps them apart. A true development is one that is conservative of the course of development that went on before, which is a development and something besides. Development adds an *and* to an idea, not a *but*.

Here again Newman is hopeful, refusing to foreclose on the future. He is here addressing the problem of the relationship between innovation and tradition that is the whole point of his essay. For him these preservative additions illustrate, not obscure; they corroborate, not correct, the body of thought from which they proceed.

They act as imagination does for Ricoeur (in White, 1986) in that they recollect and reiterate types across discontinuous episodes while they project new horizons of possibility. This is an example of creation-as-discovery. Changing from a false to a true religion is an example of a preservative tradition, Newman suggests. He argues that such a change consists chiefly in addition and increase, not in destruction. It creates the new out of the old, because true religion is the summit and perfection of false religions.

Chronic Continuance

The last test Newman labels *Chronic Continuance*. The corruption of an idea is a sort of accident or affection of its development. It is the end of a course and is the transition-state leading to a crisis. According to Newman, once corruption sets in the course downwards is always short. This is how corruption is distinguished from decay, because corruption's energetic action explains its quick and transitory character. Corruption, of its nature, cannot be long standing. Thus *duration* is another test of faithful development.

A Presumption of Change

The most obvious presumption in Newman's seven tests of the right development of doctrine is that, taken together, they presume considerable ongoing change in the Church.

They also presume a great amount of time being available for the process of discerning what is corrupt and what is not. *Newman's tests preclude any rush to judgement*. The task for all Catholics is to decide gradually, in the light of the long history of the Church, and in dialogue with the present and the future, what change is decay, what corruption, and what is faithful, and therefore life giving for the institution.

Catholics have to keep in mind that good interpretation and right discernment are both faithful to the original message, while at the same time they constitute an original work. In setting out the seven tests for knowing whether or not a development is corrupt, Newman provides guidelines for a functional process of participation in the development of doctrine at the level of learning communities, but he does not tell us how to use them. He does, however, point towards a way.

True Meaning Occurs only in Context

The way Newman points to is to apply his tests communicatively (Dunne, 1993). As Joseph Dunne notes, the form of reasoning by which Newman describes the grounds for clarifying religious belief is essentially similar to that which can be shown to operate in other areas of knowledge (Dunne, 1993). To form a theory of development

of doctrine in schools that leads to meaning making in the present context, the answer is to use a critical-moderate hermeneutical approach (Dunne, 1993).

Newman, whose essay employs a moderate or a critical-moderate hermeneutic, has made essential to his tests the desire *to embed the Church's message in the world in an appropriate way*. That is, the task is to engage with culture. This is Newman's accomplishment; he has realised the embedded nature of the Church's message that cannot be separated out from life. For Newman, Church and world are, inevitably, part of each other's context. This recognition of contextuality is what renders his hermeneutic moderate or moderately critical. While maintaining continuity with tradition he sees the need for transformation if the tradition is to survive. Via a theory of development of doctrine he is able to bridge the gap between being faithful to the tradition and being original, and in this he is like Aquinas (1227–1274) (MacIntyre, 1988). He is able to be critical of the tradition while being moderate in his originality. In other words he implicitly espouses a moderate-critical hermeneutic.

Continuity Through Participation

Dewey chose functional democracy as the best milieu for education. He did not mean majority rule, however, when he spoke of democracy; he meant consensus through communicative action (Dewey, 1916). He meant a political state of engaged dialogue leading to a consensus, or at least a mutual accommodation. To attain accommodation he hoped for a conscience vote on each issue, in which all voters would vote against their own material interests if that led to consensus or near consensus in a way that was for the common good. In Dewey's kind of democracy, individuals can vote against their own material interests, because they know that, in cases where they oppose, their opposition is taken seriously because it is considered to be morally serious, mature, competent, and validly grounded in someone's experience. The function of open participation was what Dewey had in mind. For him education is adaptive meaning making. It is the creation of new meaning out of former meaning, and present experience, and the reconstruction of prior habits into new ones. To have these we need institutionalisation of discourse, and democracy is the best form of institutionalisation (Dewey, 1916).

All Catholics are Involved

Newman does not speak of democracy in the Church, though he went to some pains to show that in matters of doctrine the laity are consulted; indeed that it has on occasion been the People of God who have led the hierarchy in maintaining continuity of faith and practice. This is very close to Dewey's position. Of course, when it comes to the last word on defining doctrine, the Pope is the final authority, though he does not have the last word for there is no last word. The final say is final *for now*. We are all parts of the institution of learning because the Church is

a learning society. It is clear in Newman's tests for the development or corruption of ideas that he presumes the Church is a society that combines numerous and varied points of shared common interest. It is an institution. This recognition of mutual interests among participants is what will lead eventually to corruption being eradicated and development being embraced. Newman is describing a Church that by its nature fulfils Dewey's first pre-requisite for democratic culture, in that there is recognition of common ideals.

Newman also accepts that change in the Church to meet new situations is good, and that it is arrived at through long discussion; indeed, it takes into account the discussion of the centuries. Here it comes close to meeting Dewey's second pre-requisite, that of having a wide, flexible range of points of contact with other groups, enabling cooperation and communication. In this case, as Newman shows, the 'other groups' (1845) extend over time as well as place.

Change is not only a good idea, it is necessary for the Church to survive. It must change to the extent necessary for it to recognise differences, to acknowledge what is valid in other cultures, to become tolerant of some degree of cultural diversity. It will be influenced by different theories as well as by different practice, and those ideas that have true development at their heart will, of their nature, take hold of the minds and hearts of the people.

Newman claims that if Catholicism is a universal religion suited not only to one period of history or to one locality, it has to vary in its relations and dealings with the world around it. That is, it must develop (Newman, 1845). His view on political action around change is expressed obliquely: 'If the Catholic hypothesis is true, it neither needs nor is benefited by unfairness' (Newman, 1845, p. 225), and his parameters for discussion are drawn wide: 'No doctrine is defined until it is violated' (Newman, 1845, p. 209). That they have not been violated is the reason so many doctrines of the Catholic Church have not needed to be defined.

Newman did not discuss democracy as a way of developing doctrine, and certainly he would not have considered it if it meant 'majority rules', though in expounding '*securus judicat orbis terrarum*, what everyone everywhere has always held' (Newman, 1995) he was embracing a broad Church. In the long run, though, he argues for the authority of fixed principles. There is a deposit of faith, what Newman calls in one place 'the credenda of Christendom' (Trevor, 1974) and there has to be an organisational way of making decisions. In adhering to its own principles the Church 'has been able to incorporate doctrine which was external to it without losing its own' (Newman, 1845, p. 352).

Newman was aware that there are times when the interpretive authority of the organisation has to be called on. He was a strong believer in the ultimate authority of the Pope, as he showed in 1870 when infallibility was declared a doctrine at the first Vatican Council, though he did not support all the political manoeuvres that led to the declaration, nor was he happy with the timing (Trevor, 1974). However, he was on the side of time being spent, and people included. He was against what he called 'reckless, tyrannical and heartless ecclesiastics' and in a letter to a friend

at this time, a period when steam trains were the fastest mode of transport, he summed up his position:

We do not move at railroad pace in theological matters even in the nineteenth century. We must be patient and that for two reasons, first in order to get at the truth, and next in order to carry others with us. The Church moves as a whole; it is not a mere philosophy; it is a communion; it not only discovers but it teaches; it is bound to consult for charity as well as for faith (Trevor, 1974, p. 241).

On the whole Newman, despite the 'heartless ecclesiastics', is hopeful both of the hierarchy of the Church as the interpretive authority, and of the People of God as consultants in the development of doctrine. That is, he opts for a process of communicative action. His whole essay on development, his whole life in fact, displays an awareness of the complexity of change and decision making in Catholicism.

Conclusion

Religious education is part of the process of communicative action that is necessary to the development of Catholic tradition. Catholic schools, being part of the People of God, are involved in this communicative action and so are places where doctrine develops. The explication of this claim is the task of further chapters, but the process of communicative action has many ways of beginning. One of these is the dialogue between the work of Newman and Dewey that this chapter begins. It is just one more example of the desire to preserve the tradition in the only way true preservation is possible; that is, by constant interpretation.

THE ESSENCE OF EDUCATION IS RELIGIOUS

Anne Hunt

Australian Catholic University

Introduction

It was the late British mathematician and philosopher, Alfred North Whitehead (1962, p. 23), who expressed the remarkable and oft-quoted insight: 'The essence of education is that it be religious.' It is this somewhat startling insight which prompts this philosophical and theological reflection on the nature of education as inherently religious. There is no doubting that education—be it in regard to pre-school, school, or post-compulsory education—is a topic of great interest in the public domain, as is so evident in the frequent discussion of issues pertaining to education in the public press. Discussion of various social problems, be they road safety or obesity or dysfunctional relationships, is almost always accompanied by a call for better education, usually at school level, to address the problem. It would seem that no one lacks an opinion on what education should address and achieve. But in the current context of the separation of the public from the private domains of life, and the relegation of the religious to the private domain that is so strong a feature of contemporary Western postmodern life and culture, it may seem somewhat odd to speak of the essence of education as *religious*! Yet, that is indeed the exploration that I want to pursue in this chapter: that the essence of education is religious. Note that I am not saying that the essence of *religious* education is that it be religious, but that the essence of education, understood in its broadest and indeed its deepest sense, is religious. In choosing Whitehead's engaging expression, let me also state clearly that I do not intend to chart the development of his thought, to critique his work, or even to evaluate his contribution.

Prompted by Whitehead's words, what I explore in this chapter is the notion of the essence of education as religious. So much of the contemporary discussion of teaching and learning in the education sector—primary, secondary and tertiary, as well as in the professional and vocational training area—is expressed in terms of measurable outcomes, graduate attributes, and bench-marking indicators. But I suggest that to limit one's understanding of the educational endeavour to measurable

outcomes represents a serious reduction and attenuation of what is involved. Our endeavours in education radically transcend such a limited horizon. I contend that education is indeed an inherently religious exercise, more even than an inherently spiritual exercise, though the spiritual dimension is undoubtedly an element of the process. (See Carrette & King, 2005.) Hence, my aim is to explore and tease out the meaning of education as a distinctly religious endeavour, even if that religious character remains implicit and unthematized (i.e., not expressly recognised or articulated or acknowledged).

To be Religious?

This exploration clearly hangs on an understanding of the meaning of religious. What do we mean when we say that the essence of education is that it be—not political or social or cultural or even values-based, but—*religious*? Cremin (1976, p. 27) defines education as ‘the deliberate, systematic, and sustained effort to transmit, evoke, or acquire knowledge, attitudes, values, skills, or sensibilities, as well as any outcomes of that effort.’ Others speak of education in more general terms, such as the historian Bailyn (1960, p. 14), who describes education as ‘the entire process by which culture transmits itself across the generations.’ Moreover, to speak of the very essence of education as *religious* is to say that all other aspects of the educational endeavour are secondary to, and subsumed under, its distinctly religious aspect.

By the term ‘religious’ we obviously do not refer to what might be termed an institutional religiosity, in other words, a particular confession of religious faith, which may or may not be associated or identified with a particular religious community. Rather, we refer at this stage of our exploration to a sense of the sacred that is not necessarily confined to any particular institutional form or expression of religious faith. Nor does our description of the essence of education as religious refer to the processes of education *per se* (although the process is not peripheral to our educational endeavours and concerns). We refer to the ultimate ends and horizon of education, and indeed we refer to the ultimate horizon of the human person *qua* human and to the human person *qua* religious, in essence. We do not speak, for example, of an educated dog, though we may take our dogs to dog school for disciplinary training and socialisation. Rather, we speak of a well-trained dog. Indeed at times we speak of children or workers as well-trained, meaning that they are disciplined and informed in regard to the skills, competencies, technicalities, activities and operations that are required of them. When we speak of a well-educated person, on the other hand, our language presses beyond the notion of being well-disciplined, beyond being merely well-informed and even knowledgeable. We intend so much more than a purely instrumental or utilitarian approach to learning. We think of a well-educated person as being cultured and refined (to use words that may seem somewhat old-fashioned and which are nevertheless in close accord with Bailyn’s description above of education as the process of cultural transmission), with a breadth and depth of knowledge and, indeed, with that certain wisdom

which permeates the person's whole life and way of being in the world. We also expect something more of a well-educated person. There is an element of shock and dismay when, for example, we hear of someone who is considered to be well-educated as being involved in unsavoury or criminal activity. Well-educated, in common parlance, connotes a certain dignity, respect and privilege, and it implies and presumes a certain correlative responsibility and magnanimity. We do indeed expect something more of the well-educated person, a certain wisdom and nobility, call it grace, a living in the appreciation of a gift.

The Dynamism of Human Personhood

The ancient Greeks recognised the human capacity for rational thought as the distinctive characteristic of a human being. The classical philosophical tradition thus speaks of the human person as a rational animal. The notion of person was in fact discovered and hammered out in early trinitarian and christological controversies! The Christian philosopher Boethius, in the sixth century, described the human person as an individual substance of a rational nature. It was not a bad definition, even if it stepped back from the intrinsic relationality of earlier theological notions. How remarkable and how precious indeed is this capacity for rationality, that finds unique expression in the human person, and which indeed comes to self-consciousness in the human person. For not only are human persons rational beings, capable of critical reflection, we are also capable of conscious and critical reflection on ourselves as thinking reasoning beings, even though, admittedly, that consciousness of ourselves as intentional subjects regularly goes unthematized, unacknowledged, unreflected upon and unanalysed. While modern science has presented us with evidence of the remarkable communication skills in the animal world, of dolphins, for example, no other animal compares to the human animal in terms of the capacity for critical thought, for creativity and imagination. Think, for example, of Pythagorus' Theorem, Einstein's Theory of Relativity, the Theory of Chaos, the landing on the Moon, all of which, together with so much more (for example, Giotto's paintings, Leonardo da Vinci's drawings, Mozart's symphonies, Bernini's angels), stand as testimony to the remarkable capacity of the human mind, a capacity that is unsurpassed in the animal world. In a sense, the human spirit is indeed *quodammodo omnia*, somehow open to all things; it is, in this sense, all things, since it can know all things.

Moreover, the human spirit manifests itself not just as the *capacity* to know, to reason, to understand, to conceptualise, theorise and rationalise in particular areas, but in the *drive* to know and to understand, transcending any limited attainment. A more probing definition of the human person might well express the uniqueness of human personhood in terms, not of capacity to know, but of *desire*, the desire to know, to love, to be. This desire to know knows no limits; the desire for the good accepts no limitations; the desire to be and to reach fulfillment similarly reaches beyond each and every limiting judgment pronounced by others. Each question we ask prompts new questions. The English theologian Sebastian Moore OSB

in fact proposes that the human person may be defined in terms of desire. The religious significance and dynamic finality of desire is central in his anthropology and theology. Indeed, we could describe Sebastian Moore's work in terms of a theology of desire. (See, for example, Moore's *Jesus: The Liberator of Desire*, 1989.) It is the desire to know that is the source of every particular question, every insight, every judgment; and each new insight and each new judgment prompts ever-new questions, insights, and judgments, prompting further reaches into the unknown. Never satisfied, ever restless, this desire to know is limitless in its desire to know all that there is to know. Its ultimate quest is what is ultimately true. It seeks the truth that grounds all truth.

Karl Rahner SJ, one of the greatest systematic and pastoral theologians of twentieth century Catholic theology, takes up this understanding of the human person as knower. (See, for example, Rahner, 1987.) He recognises that our sense of our own finitude is in fact grasped against a sense of an infinite horizon; in other words, it is only against a background of the infinite that we grasp the finite. In this way Rahner focuses on our implicit awareness as human beings of, and indeed openness to, infinity. Rahner thus defines the human person or human spirit as openness to the infinite. This openness to the infinite finds expression in the dynamism of human transcendence, whereby our spirit quests ever onward and forward and beyond, never satisfied with what we know and glimpse here and now, reaching ever outward, toward the infinite, in eager anticipation of its fulfilment. Nothing less than the infinite will satisfy us. It is as if our questions, our insights and judgements are anticipations and presentiments—promises indeed—of that ultimate fulfilment.

Rahner argues that the human person, precisely as knower, lover and doer, cannot fail to raise the question of being. He would persuade us that the question of being is the question implicit in every question we ask. Our ultimate question, our primordial concern, even if implicitly and not explicitly expressed, is about being. In the question of this or that particular finite being is implied the question of infinite being. In this sense, the human person has an implicit, pre-conceptual, pre-grasp of infinite being, of infinite existence, of the ultimate horizon of all our knowing. Rahner thus describes the human person not as a rational animal, but as embodied spirit, an historical spatio-temporal being whose spiritual dynamism is consciously, although implicitly, directed toward Infinite Being (God), who is its horizon. As Rahner explains:

Can you realise that all human beings, whether they are aware of it or are quite unable to tell it to themselves, possess an innermost ultimate dynamism of their spiritual existence? Can you realise that human beings, when they act, when they love, when they think correctly, when they search, when they inquire, when they act freely and responsibly, are ultimately intending the ineffable, unfathomable mystery that we call God? (Rahner, 1986, p. 76).

Our restless quest for ever more knowledge and understanding attests to our quest for the infinite. Nothing less will satisfy us. No one less than the One who is Infinite

Being will satisfy our yearnings. For many reasons, however, our grasp of the One who is Infinite Being may remain unthematized, unnamed, not recognised in any explicit way.

While classical philosophical approaches to a definition of human being focused on the human capacity to know and to reason, and so stressed the human person as *rational*, more modern approaches urge us to move beyond a focus on the capacity for rationality to an appreciation of the profoundly *relational* nature of authentic human existence. The environmental crisis, the ecological movement, and indeed developments in scientific understanding have prompted a profound appreciation of the interrelatedness of all creation in an all-creative field of life and being. (It is the sense that Seamus Heaney [1996, p. 20] captures when, in the poem *St Kevin and the Blackbird* he speaks of finding oneself 'linked into the network of eternal life.') This perspective privileges an understanding that, as human persons, we live and have our being not in solitary splendour, in isolation from all else, but in an intensely relational involvement with the all, the whole and the ultimate.

This new-found focus on relationality reflects much more than a mere change of perspective, a newly developed focus, a change of attitude on our part. It has a real foundation, namely our common participation in creation, for our very being and all created being participates in the one mystery of the cosmos, the one mystery of being. Our capacity for rational thought and our unceasing quest to probe ever further and ever deeper the intelligibility of the universe, is thus situated in the larger context of our connectedness, not only to each other, as human persons, but also to all life and indeed to the entire cosmos, animate and inanimate, past, present and future. We are literally made from stardust. In the very atoms that constitute the cells in our bodies, we are materially and physically connected and related to all creation.

Our sense of connectedness and interdependency finds its ultimate expression in loving care for the other, in love for all others, in concern for the common wealth of all peoples and for the common good of all creation, and, indeed, in love for the One who created it. In this way, our quest to know all that there is to know leads us ever deeper into the mystery of all that is, and to a love for all that is. Here too the human person manifests not just the capacity for love and for the good, but a *desire* for the good, which, like the desire for truth, is limitless in its quest, ever pressing beyond any particular good in its quest for the unlimited good, in anticipation of the good that grounds all goodness, the infinite good that we sense, even if but implicitly, in every particular good.

The (recently) much-maligned Augustine, in the fifth century, captured this sense of the nature of the human person in his exploration of the human person as knowing and willing, as understanding and loving. Indeed it was Augustine who first recognised the very image of the trinitarian God in the human operations of remembering, understanding and loving, an analogy of perennial value in Christian faith's effort to reach some understanding of the mystery of God's triune being. For Augustine, the human mind's operations of remembering, understanding

and loving reflected the triune image of God as Father, Son and Holy Spirit. As Augustine explains:

I do not say that these things are to be equated, even by analogy, with the Holy Trinity, that is to say are to be arranged according to some exact rule of comparison. This I do not say. But what do I say? See, I have discovered in you three things which we see as exhibited separately but whose operation is inseparable (Augustine, Sermon 52, x, 23. Ulanov, 1983, p. 127).

Thomas Aquinas, in the thirteenth century, recast Augustine's profoundly experiential reflections on the operations of knowing and loving in the human person in terms of the more refined framework of Aristotelian philosophy then available to him. In Aquinas' hands, an understanding of the human person emerged in terms of the human faculties of intellect (understanding) and will (love). Admittedly, this understanding of the human person, so richly portrayed by Augustine and so elegantly refined by Aquinas, was later to suffer, in the hands of less adept interpreters and in the drastically attenuated summaries in the standard Scholastic theological manuals of the nineteenth and twentieth centuries, what we might call an intellectualist distortion, wherein the intellect and its capacity for understanding was given such priority over that of the will and its capacity for love that the latter was effectively obscured from consideration.

This intellectualist distortion had its source in the medieval adage, based on the human experience, that that which is loved is first known. After all, in our normal limited human experience, we cannot love what we do not first know. In our finitude, it is normally that case that we must first know something or someone before we come to love it or him or her. It was this aspect of our human experience, that that which is loved is first known, that served to justify the priority of knowledge over love. And yet, it is also true to our experience of love that, in a very real sense, that which is known is not actually fully and really known *until* it is loved. We know more fully what we truly love. The experience of the mystics also gives us a glimpse of a love that does not rely so directly or immediately on knowledge. It is that kind of knowledge to which Blaise Pascal (1952, IV, 272, on p. 222) famously refers when he writes: 'the heart has its reasons which reason does not know.'

The modern tendency, on the other hand, is to distort the image of the human person in the opposite direction, in what we might call a voluntarist direction, which eschews responsibility for the collective task of judgements of value, thus leaving those judgements dangerously subject to the arbitrariness of individual assessment and personal whim. We opt out of the hard work of analysis and judgment, preferring to agree to disagree! The result, as Alasdair MacIntyre (1984, 1988, 1991) has observed, is a world of moral discourse that is characterised by interminable debates on questions of value and morality. The reluctance to make judgements of value that is a consequence of this kind of voluntarist distortion effectively leaves the discourse bereft of a rational way of assessing competing moral claims.

So, while classical philosophy described the human person in terms of rationality, Augustine, and Aquinas following him, recognised that the human person

is characterised by the operations of knowing and willing, the faculties of understanding and loving, what we in more modern terms might express in terms of rationality and relationality. Their insight is still valid, I would argue. Who of us would not claim both notions of rationality and relationality as capturing that which distinguishes ourselves *qua* human beings. Are not our endeavours and our commitments, at our best, characterised by rationality—in terms of our disinterested quest for what is true—and by relationality—in terms of our quest for the good, for the common good and the common wealth? Are we not seekers of the true and good? Indeed, is that not what we seek to articulate when we speak of a person as authentic and his or her efforts genuine? Admittedly, Augustine and Aquinas express their understanding of the human person in language and conceptuality that is foreign to modern ears. Here we can turn to Bernard Lonergan SJ (1957, 1972) who refashions their insight into the nature of the human person in terms that are more accessible and amenable to modern thought.

Human Intentionality and the Dynamics of Self Transcendence

In Lonergan's hands, the Augustinian–Thomistic image of the human person and the human capacity for understanding and love is transposed in terms of the language of human subjectivity and the dynamism of human intentionality. (By intentionality, we mean our own reality insofar as we are conscious self-transcending subjects of experience and intention.) Lonergan thus shifts the emphasis away from the classical tradition which treated the human being as a metaphysical substance distinguished from other living beings by psychological attributes and powers, to an analysis of the human being as psychological subject: finite, factual, historically situated, conscious and intentional.

Seeking to identify the fundamental dynamism of our questioning, thinking, judging, in our restless quest for the good, the true, the beautiful (and indeed the holy), Lonergan, in an analysis of human intersubjective intentionality, teases out the dynamics at play in the unrestricted desire of human intelligence to know being, that process of self-transcendence that drives us forward to ever new questions and new insights. His concern is an analysis of the dynamism of intentionality which lies behind all our cognitional activity, even if, as is so often the case, that dynamism remains unacknowledged and unthematized, as such, in the human subject who instantiates it.

Lonergan recognises that our conscious activity is structurally organised according to the categories of attention, intelligence, reasonableness, and responsibility. These categories of conscious intentional activity, he maintains, lie at the very centre of who we are as human persons, even if generally unacknowledged. They constitute a dynamic pattern of recurrent and related operations in which the desire to know unfolds, with the unrestricted desire to know driving and indeed uniting the cognitional operations.

Lonergan then articulates what he describes as the transcendental precepts, the perduring trans-cultural trans-historical operational precepts that underlie, shape and

drive our distinctly human way of being in the world: Be attentive; be reasonable; be intelligent; be responsible (Lonergan, 1972, pp. 20, 53, 231, 302). The precepts, he argues, describe the distinct imperatives that drive the human subject toward self-transcendence and authenticity.

- Firstly, be attentive to the data of experience, the empirical data of consciousness.
- Secondly, be intelligent in one's inquiry into the meaning of the data of experience, and in one's effort to understand the data.
- Thirdly, be reasonable in one's critical reflection, assessment and judgment as to the accuracy and reasonableness of one's judgments of fact and of value.
- Fourthly, be responsible in one's deliberations, decisions and commitments, based on those judgments of fact and of value.
- Fifthly, Lonergan adds, 'be in love,' i.e., act out of love for the human world, the whole world, and ultimately with the mystery that grounds everything that is.

Lonergan thus recognises that human knowing emerges from a dynamic structured recurrent pattern of intentional operations. He goes further and gives the name 'transcendental method' to this pattern of operations that begins in experience, proceeds to the level of understanding and conception, and terminates in judgment. The central thesis of Lonergan's cognitional theory is that every successful enactment of inquiry follows this transcendental method, this normative pattern of recurrent and related operations yielding progressive and cumulative results. Driving the process is the impetus of intellectual desire, the unrestricted desire to know which, by its very nature, consciously, intentionally, intelligently, and rationally transcends the limits of the inquiring subject. It drives the human subject successively from one level of intentional content to another; from data to intelligibility, from intelligibility to truth, from truth to being, and from being toward the whole of what exists. Finally, Lonergan (1972, p. 265) would have us grasp the uncanny paradox: that truth itself is the fruit of genuine subjectivity, for, as Lonergan explains, 'objectivity is simply the consequence of authentic subjectivity, of genuine attention, genuine intelligence, genuine reasonableness, genuine responsibility.'

Education as the Cultivation of the Dynamism of Self Transcendence

While Lonergan's language may also have a somewhat foreign ring about it to those unfamiliar with his thought and work, is it not so that these precepts—particularly the first four: be attentive; be reasonable; be intelligent; be responsible—effectively describe the fundamental characteristics of our experience of critical reflection and indeed of research methodology, as we know it at its best? Does not our work in research, for example, emerge from a fundamental dynamism of questioning, attending, thinking, judging, and, more deeply, the dynamism of an unrestricted desire to know, that drives us forward to ever new questions? Our learning, our teaching, our study, our research flows from our desire to know which, by its

very nature, consciously, intelligently, rationally, and responsibly drives the human subject successively from empirical data to intelligibility, from intelligibility to truth, and ultimately from truth to being, and from being toward the whole of what exists.

Similarly, are these precepts—including even the fifth ‘be in love’—not also the very kinds of operations, indeed the method, to which we refer, in modern business or organisational terminology, when we speak of best practice? By best practice we mean practice that is sound and reliable, effective and efficient, ethical and responsible, practice that is to be emulated, practice that is genuinely praiseworthy and good; in other words, authentic practice? The language of best practice, like the language of research, refers to the very same surrender to the demands of the human spirit which we have just described as constitutive of authentic personhood: be attentive; be intelligent; be reasonable; be responsible; even be in love (albeit admittedly in a less overt sense in that case, but be in love in the sense of a fundamental commitment to and concern for what is true and good and the common wealth).

All of this is to speak of the fundamental dynamism which is characteristic of the human spirit. It is manifest in the desire to know, a desire which is limitless in its reach, and which seeks an unlimited intelligible, ultimate truth, the truth that grounds all truth, and in the desire for the good which is similarly limitless, knows no bounds, and seeks an unlimited good, the ultimate good which grounds all that is good. Its ceaseless quest is the ultimate horizon of what is good and true, even though the horizon that lies beyond all of our striving may remain implicit and unthematized. It is in this sense, I contend, that we can speak of religious and of the essence of education as essentially religious. So, to say that the essence of education is religious is to advert to the dynamism of human person whose desire for truth and goodness ultimately seeks ultimate truth and goodness. In this sense the human person is religious, even if implicitly and not explicitly, and in this sense education, as the cultivation of the desire for truth and goodness and beauty, is in essence religious.

Education is more than the mere cultivation of values, more than the transmission of culture, more even than spiritual as such. (I suggest to the reader that ‘spiritual’ describes the orientation and dynamism of the human person, while ‘religious’ refers to its ultimate term and horizon or destiny, so to speak.) It is more than a merely intellectual or cerebral academic endeavour. Rather, it is essentially concerned with the formation, indeed the transformation, of the mind and heart of the human person and the cultivation of the dynamism of self transcendence in its desire for what is true and for what is good and, as the ancients would rightly add, the beautiful. It aims to educe in human consciousness the principle of creativity, calling into question even the settled positions of culture itself. The educated person is not merely trained for a job, but is one who can criticise what society defines as the job; the educated person is not merely skilled in how to make a living, but how to make a life. In that sense, the essence of education is rightly and properly described as religious. Notice that I have described the essence of education as religious in

terms of the dynamism of the human person, the dynamism of human intentionality, and the implicit infinite horizon that is implied in the spiritual dynamism of the human person and the exercise of human subjectivity. It is in this sense, then, that we can speak of the essence of education, of all that is education (not simply that which is explicitly religious education, but all that is education as we understand it, as distinct from mere training or instruction or schooling), as the cultivation of the human person in his/her quest for the true and the good and the beautiful, and as such, in essence, a religious endeavour.

Education as Religious

Now in Christian faith and theology we bring a further level of explicitly religious consciousness to these considerations. The distinctly religious character of the endeavour of education then finds expression with singular clarity. Firstly, an explicitly Christian understanding of the dynamism and subjectivity of the human person names the infinite horizon of the human quest for the true and the good and the beautiful as God. Secondly, following Augustine and Aquinas, and the theological tradition that is their inheritance, the Christian tradition not only recognises the operations or faculties of understanding and love as expressive of the uniqueness of the human person; it recognises, precisely in those aspects, the very image of God in which the human person is created. Moreover, under the impetus of trinitarian faith, Christian theology finds an analogy, properly speaking, between the human person's operations or capacities for understanding and love and the trinitarian processions, by which the Word (or Son) and the Spirit proceed from the Father, who together constitute the mystery of God's triune being. In other words, trinitarian theology recognises that the inner-trinitarian processions of the Word/Son and the Love/Spirit are somewhat analogous to the operations and dynamism of human intentionality which issue in understanding and love.

The Christian tradition also understands that, in the order of grace, the human person actively participates in and is dynamically conformed to the understanding of the Word and the love of the Holy Spirit. The Trinity of the three divine persons comes to abide in the human person, and the indwelling divine persons dynamically conform the graced human person to the Triune God by conforming the human person's knowing and loving to the divine knowing and loving. Our self-transcending acts of knowing and loving are thus progressively conformed to the Trinity of divine persons present to us in grace. Thus transformed and conformed, the graced human person, albeit but dimly, understands and loves as God does. Admittedly, this insight afforded by the psychological image of the human person into the mystery of the Trinity has, for a variety of reasons, fallen seriously out of favour in contemporary Christian theological discourse, and the social models of the Trinity are currently enjoying the esteem once enjoyed by what came to be known as the psychological analogy. But the pearl of great value, the insight of perennial profundity, that lies at the heart of the psychological analogy, remains.

The Christian tradition thus understands the relationality that is so dear to modern understanding of the human person as firmly grounded in our real participation in the universe of divine creation, as both matter and spirit: (a) bodily, through being part of the physical cosmos; (b) spiritually, in that we participate, as the image of God, in the divine consciousness of knowing and loving; and (c) as graced, sharing in the life of God. In other words, the relationality is grounded in a real foundation, a foundation that is our real participation in the one mystery of being.

But note that, while an understanding and appreciation of the educational endeavour as inherently religious fits more easily within a Christian world view, my argument that the essence of education is that it be religious does not hang on a distinctly Christian understanding of God. It hangs on an analysis of the spiritual dynamism of the human person, an analysis of human intentionality which strives toward limitless truth and goodness, and ultimately the true and the good which grounds all that is true and good. Education as the cultivation of this quest for what is good and true and beautiful is, in this sense, religious. In other words, because the very essence or nature of the human person lies in this dynamism toward ultimate mystery, we can speak in terms of the very essence or nature of the human person as religious and of the very essence of the education of the human person as religious. We speak, moreover, of the *essence* of education as religious, meaning that the religious is not just a dimension of education, as if one dimension among many dimensions, but rather that the religious lies at the very heart of the matter, that it constitutes the very essence or core of our endeavours and permeates the entire process of education.

Education as Journey

Let us turn now to consider the notion of education more closely. Education is in fact in some ways a strange word. The English philosopher of education, Richard S. Peters (1967, p. 1) notes in an essay *What is an Educational Process* that 'education is a concept which is not very close to the ground.' Unlike red or horse, which identify qualities or objects, or running or smiling which identify observable occurrences, education refers to no particular process; rather it encapsulates criteria to which any one of a family of processes may conform. The very use of the word education, as well as the enormous investment of resources that our society makes in it, is indicative of a sense of importance and worthwhileness of the endeavour that we name as education. Intrinsic to the concept of education is the notion of having value—that certain things, activities and outcomes have value in themselves. Education implies the transmission and cultivation of what is of value, indeed of ultimate value. In other words, to educate someone not only implies some sort of achievement or outcome or transformation, but also one that is worthwhile. Is it not a contradiction in terms, for example, to speak of a *bad* education, for education implies what is good and worthwhile? A *bad* education is in fact no education at all!

On the other hand, can we really say we have had a *good* education? As a noun, education reads rather like a commodity, as if it is somehow capable of being parceled out, measured, distributed, ingested, even bought and sold. Admittedly, for a number of Western economies, international education has become a very significant contributor to the national economy and this has contributed to a certain commodification of education. But education is not a commodity defined by the culture, but rather what defines the creativity of the culture, resisting its entropy and promoting its progress. Moreover, it is not a thing but a process, indeed an intensely dynamic process. Education is in fact something that we do rather than something that we have. Despite the language of delivery in the education market place, we do not really deliver education. Rather we, as professionals in the field of education, provide the opportunity and stimuli for learning. Much as we as educators might work to persuade, cajole, even coerce our students in their learning, we cannot actually make our students learn. The learning resides in the student whose active participation is essential to the process. It is the learning that determines whether or not the 'event' in question is one of education or not, not the presence of an educator or even the intentional act of teaching *per se*. The teaching resides in the presentation and facilitation of the learning process and active engagement with the learner in his/her learning.

My own preference is to resist the noun *education* and to speak instead in terms of being educated, because it better connotes the sense of an ongoing process or journey, indeed a lifelong journey. The metaphor of journey is apt in a number of ways, not least because it renders the sense that it is never as if one's education is complete, finished, finalised. The metaphor of journey connotes an ongoing exploration, an unending task, a lifelong quest, of never having arrived, and of ever reaching further towards the unreachable. The metaphor of journey also speaks of the matter of attitude as of aptitude for the journey.

Richard S. Peters (1973, p. 20), in an article entitled *Aims of Education—A Conceptual Inquiry*, exquisitely captures this notion of education as journey when he writes: 'To be educated is not to have arrived at a destination; it is to travel with a different view.' Peters adds: 'What is required is not feverish preparation for something that lies ahead, but to work with a precision, passion and taste at worth-while things that lie at hand.' (See also Peters' article *What is an Educational Process*, 1967, p. 8.) Here too the notion of the nature of education as religious surfaces. It is, I suggest, to be found in Peter's notion of travelling 'with a different view'. Here, as I understand it, Peters means that education is not merely the acquisition of skills and information, but the transformation of the human person, a transformation that results in, and expresses itself in, a different view of life than would have pertained otherwise. From this perspective, education implies and requires that a person's outlook is transformed by what he/she learns. It has a distinctly *attitudinal* aspect, and one that encompasses more than mere acquisition of values. In other words, the educated person is transformed by the deepening and broadening of his/her understanding and sensitivity. The transformation permeates his or her whole way of perceiving, thinking, acting and being.

The notion of a different view also alerts us to the nature of the journey itself and picks up on the inner personal journey, the journey within, the journey towards ever-deeper authenticity and ever more genuine subjectivity. The measure of one's education in this larger perspective is not the competencies and attributes acquired or even the values instilled, but the qualitatively different view that has been cultivated. Clearly, by a different view we do not mean a particular set of ideas or doctrines. Education is not indoctrination. The different view refers to the transformed heart and mind that results from the educational process, and which finds expression in a different attitude or perspective. It is a perspective that is ethical, and yet more than ethical in any narrow sense. It is a perspective that is expansive in its sense of the whole, magnanimous in its concern for the common wealth, open-minded and open-hearted in its self-transcending commitment to what is true, good and beautiful. The Australian theologian Anthony Kelly CSsR (2004) captures it, in an as yet unpublished paper, in terms of a symphony of consciousness, 'in which mind and heart, sense and imagination, intelligence and responsibility, body and spirit, reason and faith, all have their respective parts to play.' Recall the common sense in the public domain, described earlier in this paper, that an educated person is more than simply skillful or well informed or knowledgeable, but manifests a nobility of spirit, a certain generous and gracious comprehension of reality, a certain wisdom. The metaphor of journey also resonates with the notion of wisdom, as attuned to the deepest desires of the human heart and their ultimate quest and fulfilment. Here too we find intimations of the sacred, intimations and presentiments—promises indeed—that the essence of the endeavour that is named as education is distinctly and profoundly religious.

Education in a Christian School or University

In a Christian school or university the religious dimension of education rightly and properly finds explicit expression, and in a distinctly Christian form. The publicly professed Christian identity of the school or university provides the context for the explicit articulation of the inherently religious character of education. Here I would like to elaborate on some of the implications of an understanding and appreciation of education as essentially religious.

It means first and foremost, I suggest, an explicit acknowledgment of the tasks of education as deeply and intrinsically religious, beyond the acquisition of measurable graduate attributes, skills and competencies, of information and technical expertise, even of values. It envisages nothing less than the cultivation of a worldview that is attuned to the sacred, to what Rabbi Abraham Heschel (1984, p. 16) describes as 'the holy dimension of all existence.'

As a Christian university or school, an appreciation of education as essentially religious means that an explicit concern for the whole, for all creation, the common good, and the common wealth, informs all that we do and all that we strive for. Here Weil (1950, p. 100) would challenge any small-mindedness in our thinking for, as she comments, 'How can Christianity call itself catholic if the universe itself

is left out?’ The point is that the catholicity of our vision, the catholicity of the horizon within which we live and work and commit ourselves, is intrinsic to our work in education. Indeed, our Christian convictions recast the very notion of our endeavours in education in terms of mission, a mission to bring to consciousness that implicit horizon that we recognise, name, worship and adore as God.

An appreciation of education as essentially religious also implicates an understanding and appreciation of the student *qua* human person in explicitly religious terms, irrespective of the actual faith conviction and religious affiliation, or lack of it, of the actual student concerned. It esteems the inalienable dignity of the student and the sacredness of his/her journey, and the sense, so beautifully depicted in the poem *Five Days Old* by the Australian poet Francis Webb (1969, p. 150), that together, as teachers and learners (and we are all both teachers and learners), we are ‘launched upon sacred seas in the mystery of creation’. Christian faith further hones our understanding of the human person and of the ultimacy of the human quest for the true and the good, in terms of the student’s ultimate destiny, as loved by God, as destined for eternal life, and as called to mission in this life, a mission to serving the common good.

In terms of our aims and our objectives for our students and their learning it means that our aspirations are not reduced to a notion of measurable skills and competencies. It is not, of course, that we resile from the work of developing skills and competencies, but that we work and hope for so much more. Indeed, we dare to aspire that our graduates will go on and will ‘fare forward’, as T. S. Eliot (1963, p. 211) says in ‘The Dry Salvages’ in *The Four Quartets*—‘Not fare well, But fare forward, voyagers’, imbued with a sense of the distinctly religious dimension of their lives and their professional work and the contribution that they have to make to the world. We aim for an expansive and magnanimous, and indeed an explicitly religious, sense of what it means to be human and of human destiny. We aim for not just technical competencies, for more than values, for more even than gospel values. We aim for the living out of the gospel message itself, which is not about something but Someone, and about ourselves as being called and becoming someone too, indeed children of God, co-creators: ‘I have come that you may have life and have it to the full’ (Jn 10:10).

An appreciation of education as essentially religious also implicates an understanding and appreciation of ourselves and our role as educators. Thomas Groome (1998, p. 37) refers to Plato’s evocative description of teaching as ‘turning the soul’ of learners; in other words, of shaping their inmost being, turning their souls toward the true, the good, the beautiful—the outcome of which is wisdom and the virtuous life. Our goal as educators is much more than benchmarked outcomes in terms of the graduate attributes, but wisdom, virtue, magnanimity, and nobility of spirit. Moreover, our appreciation of education as religious extends our horizon of concern beyond the students’ academic progress to encompass their whole lives and finds expression in our pastoral concern for their whole development and well-being. Education in a Christian school or university is expressly concerned not just with how to make a living but how to make a life, and indeed how to make of their lives

a work of art, no less! Hence community engagement and social justice outreach programs are our proper concerns and, as such, not optional extras but intrinsic to our programs. So too our rituals and celebrations and the sense of the sacred to which they explicitly refer.

In terms of our goals and aspirations for the school or university itself, a keen sense of education as religious means an explicit commitment to an intrinsically religious vision of education and, integral to that, the pre-eminent place of theology and of religious education among its programs, as beacon lights, singularly concerned with education as religious. Moreover, they are rightly and properly not just pre-eminent *among* but *through* its programs, for the catholicity of our vision, our sense of the whole—which necessarily includes a vibrant sense of history and tradition and the place of the arts—and of the interrelatedness of everything that is, prizes interdisciplinary collaboration in our courses, programs, research and vision. In this regard, Michael Paul Gallagher (2004, p. 171) offers insightful reflections on the contemporary debate concerning university education in general and Catholic university education in particular, including a call for ‘a more integrated and integrating humanism’, as distinct from the narrow specialisations of so much academic work today.

Our Hopes Touch on the Infinite

Early in our paper we referred to such monumental achievements as Pythagorus’ Theorem, Einstein’s Theory of Relativity, the Theory of Chaos, the Sydney Opera House, the landing on the Moon, and to Giotto’s paintings, Leonardo da Vinci’s drawings, Mozart’s symphonies, Bernini’s angels, and we might also add the insights of the mystics. All stand as testimony to the remarkable capacity of the human mind and heart. But they stand not just as testimony to the capacities of the human person, but as presentiments and promises, promises of the fulfillment of our ultimate desires and longings, promises that cannot be fulfilled in this life, promises that await fulfillment in the fullness of life and Light which awaits us in the next life.

To speak, then, of education as religious is to advert to the deepest desires of the human heart and the ultimacy of the human person’s quest for what is true and good, and thus to the ultimacy that is inherent in the endeavour that is education. The notion of the essence of education as religious is grounded in the quest for truth and goodness and beauty and, implied in that quest, the quest for ultimate truth and goodness and beauty, the truth and goodness and beauty that is implicated in all truths and all goods. In the words of Thérèse of Lisieux (1992, p. 224), our hopes, our ultimate desires and our deepest longings ‘touch on the infinite’. The essence of education, as the expression and cultivation of the immanent self-transcending dynamism of human subjectivity, is religious.

In expressly Christian centres of education, whatever the age and stage of the students involved, the implicitly religious dimension of education is brought to explicit expression. The ultimate horizon that is implied in the quest for truth that

lies at the heart of the endeavour of education is, in the Christian setting, named and proclaimed and adored as God, the triune God who so loved the world that he sent his beloved only Son and who, abiding in us, conforms us to the divine understanding and love and calls us share in the divine mission of love for the world.

PHENOMENOLOGY AND RELIGIOUS EDUCATION THEORY

Kathleen Engebretson

School of Religious Education, Australian Catholic University

Expanding the Discourse About Religious Education Beyond Theology

Up until the 1970s, discourses about religious education were generally theological and ecclesial, and were to a large extent, conducted by and within Christian traditions. During the twentieth century, however, the progress of globalisation and patterns of migration to Western countries meant not only that the cultural composition of these countries changed, but also that they became home to a wide variety of religions and cultural expressions of these religions. Theories of religious education that assumed Christianity as foundational, or even that were biased for one form of religious expression over another, became increasingly ill suited to multi-religious societies and school systems. Religious educators, scholars and academics in Britain led the ‘religious studies’ movement, that expanded the field of theory in religious education beyond the domination of the Christian tradition.

Like all significant changes in education, the development of a new theory of religious education suited to multi-religious schools was gradual. The Butler Act of 1944 in England had made religious education compulsory in all county schools, and it was to be taught using an ‘agreed syllabus’ that would be developed under the authority of the Local Education Authority by all of the religious groups represented in the local area. Hull (1984) has documented the history of the agreed syllabi, showing that up to 1964 they concentrated on study of the past, particularly through the Bible and examples of exemplary Christian life. In the later 1960s, the agreed syllabi revealed more understanding of the experiential dimension of religious education, but these still saw religious education essentially as education in and about Christianity. Hull (1984, p. 80) illustrated the changes that were coming when he quoted from the first of the syllabi to attend to the multi-religious nature

of the British community, the Bath Agreed Syllabus of 1970, that the primary aim of religious education was to help young people to understand the nature of religion.

The city of Birmingham was the first to develop a religious education syllabus that took account of the multi-religious nature of its population, allowing for breadth of studies of religions as they were represented in the local community, and also for a particular study of one religion if the population of the school required this. The revised Birmingham Syllabus of 1970 was extremely significant for its commitment to 'a religious education syllabus that would make a positive contribution to community relations in the city' (Hull, 1984, p. 87), and for the fact that there was a distinction made between the personal religious convictions of the teacher and the syllabus content. The Birmingham syllabus could be taught by any 'well informed teacher of good will, regardless of his faith, to any interested pupils, regardless of their faith' (Hull, 1984, p. 88). It was intended to develop a critical but tolerant understanding of religion in a modern secular content, and its approach was descriptive and existential.

Hull observed that after the Birmingham syllabus, the agreed syllabi were never as influential as they had been, but he claimed that they gave 'official approval and recognition to trends already established' and registered 'the climate of the subject and set out its norms' (1984, p. 91).

Phenomenology

These trends and the climate of religious education in Britain in the 60s and 70s were significantly influenced by the work of Ninian Smart (1968, 1974, 1976, 1978,) who advocated the study of religion as a means of gaining greater understanding of human experience and of the world in which we live, without 'interest in or intention of evangelising' (Lovat, 1995, p. 1). The sociologist of religion, Durkheim (1976), had argued for the 'scientific or rational' (Nisbet, 1976, v.) study of religion, applying scientific analysis to its origins, development, and practice from the perspective of an independent observer. The purpose of this was to gain insights into religion as a whole, its history, its nature and its relationship to other phenomena in human life. Smart took up this emphasis, and developed a phenomenological approach to the study of religion drawing on the philosophy of Husserl (1983).

Husserl's philosophy of phenomenology began from the fact of the human being surrounded by a world full of 'corporeal, physical things' (1983, p. 51), animate and inanimate, which are present to human consciousness or, if unheeded, present to intuition. Each of these has its own actuality independent of one's perception of it. They include objects, but also ideas, experiences, traditions, values, other people; in fact the entire range of objects of human experience and perception. These objects or 'phenomena' furnish the individual's conscious and semi-conscious worlds.

In my waking consciousness I find myself in this manner at all times, and without ever being able to alter the fact, in relation to the world which remains one and the same, though changing with respect to the composition of its contents. It is continually 'on hand' 'for me and I myself am a member of it' (Husserl, 1983, p. 53).

Any apprehension of experience and the world must begin with the 'the natural standpoint, from the world as it confronts us' (Husserl, 1983, xix). This apprehension of the world, however, involves eidetic judgments, or judgments about the essential nature of the objects within it. These eidetic judgments lead, through description, comparison and analysis, to identification of universal phenomena within which the individual essences cohere. 'Any judgment about essences can be converted into an equivalent unconditionally universal judgment about single particulars' (p. 13). The reduction of individual phenomena into phenomenological universals leads to discovery of the complex relationships between these universals.

Good eidetic judgments about individual phenomena, and the consequent classification of these as examples of universal phenomena, require 'epoche', or suspension by the observer of all preconceptions, so that phenomena may be seen for what they are. This involves firstly a conscious 'bracketing' (Habel & Moore, 1982) of empirical preconceptions, (which cause the observer too often to come to hasty conclusions about phenomena), so that we may neutrally and objectively see 'what stands before our eyes' (Husserl, 1958, p. 43). Secondly, it involves a suspension of preoccupation with facts, to see through the phenomenon being observed to encounter its essence, the pure phenomenon. The phenomenologist therefore must learn to put aside preconceptions about what they observe, and not be distracted by the outward form of the phenomenon, in order to look to its pure essence, classify it within a universal phenomenon, and perhaps extract personal meaning from it. The phenomenologist is first a detached observer of phenomena, for the purpose of identifying their essence, finding the dissonances and coherence between them, reducing multiple phenomena to broader universal phenomena, seeing the relationships between universal phenomena so that patterns of experience and meaning may be uncovered.

Phenomenology and Religion

In 1958 Otto's *The Idea of the Holy* had claimed that religious consciousness or awareness of the numinous or the sacred existed *a priori* in the human experience. That is not that everyone is religiously conscious, but that everyone is capable of being so. It is a capacity of human nature which 'issues from the deepest foundation of cognitive apprehension that the soul possesses,' and which must be awakened. 'It does not arise out of [the data of the natural world] but only by their means' (Otto, 1958, p. 112).

That there are 'predispositions' of this sort in individuals no one can deny who has given serious study to the history of religion. They are seen as propensities predestining the individual to religion, and they may grow spontaneously to quasi-instinctive presentiments, uneasy seeking and groping, yearning and longing, and become a religious impulsion which only finds peace when it has become clear to itself and attained its goal (Otto, 1958, p. 115).

Predisposition to the numinous or religious consciousness has an *a priori* existence within the human mind, and is manifested in history in outward behaviours, values, attitudes, beliefs, which are not intrinsic to the predisposition but differently and in different historical contexts allow the person to express it. According to Otto, the phenomenon of religious consciousness, as well as the many phenomena through which it is manifested in history, may be studied, as they exist, through description and rigorous analysis. This may uncover patterns of meaning, and ultimately bring the student at least to knowledge of key images of, if not experience of, the 'entity' that is at the heart of religious consciousness.

Studying Religious Phenomena: Observation

The philosophies of Husserl and Otto helped to lead to the development of the philosophy of the study of religious phenomena, (Eliade, 1958; Hick, 1991) and to the work of Ninian Smart who was concerned with 'trying to exhibit religion and religions through uncovering the anatomy of Religion' (1973, p. 52). The following sections of this chapter illustrate Smart's phenomenological method in regard to the study of religion, and the final sections review contemporary critique of the method.

The first step in the phenomenology of religion is simply to plunge into observation and experience of religious phenomena, bracketing one's own experience, preconceptions and beliefs in order to experience and learn about the phenomenon in an unbiased way. Depending on the phenomenon being studied, this will involve all of the senses in collecting data about the object of study. This is well illustrated in numerous examples given in the BBC series *The Long Search* (1979). This series of documentaries illustrated Smart's phenomenological method for the study of religion, and involved the presenter Ronald Eyre in a three-year investigation of religious phenomena around the world. Examples were drawn from ancient and modern, as well as local and diffused religions (Lovat, 1995, p. 9; 2002, p. 45). In one series of episodes Eyre was shown at St. Peter's Square in Rome, and later within St. Peter's Basilica, observing the splendour of a papal Mass. In a related episode he stayed with a group of young religious brothers who lived in simplicity in a village in the desert, shared their lives with the local people, and celebrated daily the same ritual that Eyre saw celebrated in St. Peter's Basilica. Eyre's investigation was, to use a contemporary colloquialism, 'hands on'. He did not give long descriptions or historical summaries, but entered into the story, ritual symbol or other phenomenon with the believer in order to understand it. He approached the

investigation as an outsider, and did not bring to it any judgments that may have obstructed his ability to 'see what is before his eyes'. In both instances noted above Eyre observed and listened, asked many questions and used whatever other means were appropriate to gather data about the phenomenon.

Stepping into the Shoes of the Believer

This almost clinical gathering of data, however, is only the first step. In the words of Smart:

But religion is not something that one can see. The significance needs to be approached through the inner life of those who use the externals. The history of religion must be more than the chronicling of events. It must be an attempt to enter into the meanings of those events. So it is not enough to survey the course which the religious history of mankind has taken, it must also penetrate into the hearts and minds of those who have been involved in that history (Smart, 1976).

For Smart, while learning about and coming to understand something of a religious phenomenon did not involve adopting the belief system of the religion to which the phenomenon belonged, it did require 'imaginative participation' (Smart, 1974, p. 3) in the world of the believer. The phenomenologist must 'step into the shoes' of a believer in order to see the phenomenon through their eyes, and thus come to understand something of its significance. In *The Long Search* Eyre witnessed funerals and initiation rituals, talked to believers about their beliefs, participated when invited and always described what was evident to his senses, as well as raising his own thoughts, feelings and questions about the phenomenon. This 'stepping into the shoes' of the believer represented for Smart the intuitive side of religious studies, the side that deals with what a phenomenon means. Thus, after his stay with the brothers in the desert, Eyre reflected on what he had seen heard and experienced, and on the reasons why young men might take up this lifestyle. He distilled the meaning of the experience for himself, through appropriating the knowledge in a critical way, assessing its meaning for himself, 'picking the eyes out' (Habel & Moore, 1982) of the knowledge in order to gain some personal learning. This is the eidetic aspect of the study of religion, and it can only be done after the religious phenomenon has been fully investigated, analysed and described objectively (Lovat, 2002, p. 89). The 'judicial and critical assessment' that comes after the description of the phenomenon is Husserl's 'eidetic science', the effort to get to the heart or the essence of the phenomenon, and it is absolutely essential to the use of the method. As Lovat points out (2002, p. 88), those who criticise the phenomenological study of religious as dry, clinical, over-cognitive and relying on an unrealistic putting aside of one's own judgment have only understood its first step. The intuitive aspect follows the objective observation and description, and it is here that the student appropriates the knowledge that has been gained in a way

that is reflective and critical, and that allows personal meaning to be drawn from it. In a later paper Lovat even claimed that this intuitive, subjective dimension of the phenomenology of religions could allow for the discussion of personal religious commitment (Lovat, 2005).

Classifying Individual Phenomena into Universal Categories

While Smart saw religions as whole systems that communicate meaning, he identified six dimensions that could be found in religions, and that could be used as the basis of comparison and contrast between them. These dimensions were mythological, ritual, doctrinal, social, ethical and experiential. Each dimension has many layers. The mythological dimension, for example, represents all types of sacred stories and includes myths, legends, parables, and epics. The ritual dimension represents the many varieties of rituals celebrated in religions throughout the life cycle, including rites of passage, communication, cleansing and thanksgiving. The social dimension includes all of the ways in which a religion is organised, its social structure, history and relationships with the cultures in which it exists. It includes sacred space, sacred time, sacred persons and roles, especially as they relate to stories and rituals. The doctrinal dimension refers to the many different forms of beliefs that religions hold, including beliefs about the nature of deities, about the world and about the afterlife. The experiential refers to the many forms and varieties of religious experiences, such as revelations, numinous experiences, ecstasy and many others ways in which people experience the sacred. The ethical dimension covers the laws of a religion and the values that are inherent in these laws. While the dimensions are differentiated for the purpose of identification and classification, the links between them are more important. Ritual, for example, is founded upon sacred story, makes use of social structure, expresses and communicates key beliefs, is based first upon an initial religious experience and makes possible religious experience for those who participate in the ritual.

When individual phenomena have been subjected to observation, listening and, in the case of physical objects, handled if possible, and after consideration has been given to their meaning for the believer, the phenomenon may be classified into its wider dimension. For example, the Christian belief in God as Trinity belongs to the doctrinal dimension of religion, just as does the Hindu belief in Brahman and his many manifestations, just as does the foundational belief of Islam, the *shahada*: *I testify that there is no God but Allah and Muhammad is his servant and messenger*. The Buddhist belief in nirvana may be put alongside Christian and Muslim beliefs about the last judgment and paradise, and classified as beliefs about life after death. Thus each phenomenon is seen within its wider context, is able to be compared and contrasted with other phenomena of the same type and discloses patterns across religions that help students to understand much more fully and deeply the phenomenon we call religion. This study can lead to personal reflection about whether the patterns that are obvious in religious traditions across time and

space are anthropologically grounded; about whether they point to a capacity for attentiveness to the sacred that is innate in human nature, and even about whether the patterns through which this is expressed are biologically determined. The student of the phenomenology of religion is brought into the worldwide experience of religion with all that it has the potential to bring to the individual's search for personal meaning.

Habel and Moore (1982) and Typology

Two Australian scholars, Habel and Moore, saw the potential of Smart's phenomenology of religion for religious education. Because Smart had not designed a practical way in which phenomenology could be used with children and young people in the classroom, they set out to develop it into a religious education method. Using Smart's five dimensions of religions as the starting point, they identified eight 'types' as the 'building blocks' or fundamental elements of religions. Initial knowledge of these types—beliefs, sacred stories, sacred texts, rituals, social structure, symbols, ethics, religious experience—would give the students a language or a map through which religions may be studied. The types are the keys to learning about religion, just as words are the keys to literacy and numbers the keys to numeracy (Lovat, 2002).

A further aspect of typology is that while it is cross cultural, intending that students learn about a range of religious traditions and phenomena within them, it begins with the home tradition, that is, the religious tradition with which the student is most familiar. Only when a phenomenon has been identified within the home tradition is it taken into a broader context and shown against other examples of the type. A religious education class in a Jewish school, therefore, may begin with the story of the journey of Moses and the people from Egypt across the desert to the Promised Land (Exodus 3–24). The story would first be studied in its own right, seen in its historical, geographical and social contexts, identified within the sacred text, its elements explored and listed. Next the story would be classified as a sacred legend, and particularly as one with a journey motif. Other forms of journey stories would be read, some secular, but many from religious traditions. The journey of Jesus into the desert from Christianity (Mark 1:12–14) may be used, as may the journey of Mohammed to Medina, or the journey of the Buddha out into the world. Examples of similar stories may also be drawn from local tribal religions. The elements of the stories are listed and compared, so that the original story of Moses and the peoples' journey through the desert is shown against the patterns of the other stories, and similarities and differences are noted. Finally the original story, having been studied in the wider context, is brought back into the home tradition, and its significance in relation to the other elements—for example, its place as a foundation of ritual—is shown. In the final step, students are encouraged to reflect on the meaning of the story, both for participants in the home tradition and for themselves.

The Impact of Phenomenology on Religious Education Curricula

The phenomenological approach to the study of religion has been extremely influential in Britain, Europe and Australia, where it has presented a non-judgmental way of studying religions as phenomena of human existence, and thus of contributing to greater understanding and tolerance of the religious groups within a local community. In Britain, Grimmitt (1973; 1987; 2000) argued for greater attention to the purpose of religion as the search for meaning, and his work has helped teachers to use religious phenomena to encourage students to explore ultimate questions. In Australia during the 1980s all states developed education acts which included in their recommendations that state schools attend to the study of religion in an objective but sympathetic way, an activity which, it was hoped, would develop greater understanding and tolerance of religious groups in the increasingly religiously diverse Australian community. By the late 1980s and early 1990s (with the exception of South Australia which had had a religious studies subject for state schools since the 1970s) all Australian states had introduced into their senior secondary curriculum elective religious studies units based on the phenomenological method. In Victoria, the home state of the author of this chapter, the study was entitled *Religion and Society*, and it dealt with issues of religion and identity, roles and rituals in religions, the experiences of religious believers within their traditions, ethics, past and present challenges to religious traditions and religious beliefs in action. It is argued elsewhere that while *Religion and Society* is clearly phenomenological in emphasis it also owes much to the depth themes and ultimate questions approaches of Grimmitt, which are discussed in another chapter of this section of the Handbook (Engebretson, 1995). While the study has been enthusiastically embraced by Catholic schools, which in Victoria make up the largest single body of schools apart from the state system, it has also been taken up by other Christian, Jewish and Muslim schools and, to a lesser but growing degree, by state schools. In 2001 in Victoria, *Religion and Society* had the most significantly increased enrolment of all studies within the senior curriculum, and it continues to retain this level of enrolment through successive revisions. Writing of the similar reception the New South Wales *Studies in Religion* curriculum had received, Lovat attests the 'cleverness' of phenomenology:

The capacity of a subject to function in such diverse settings and clearly be seen as contributing to the ethos of such different kinds of schools says much in my view about the flexibility and unique cleverness of phenomenology as a method (Lovat, 2005, p. 46).

The influence of phenomenology on religious education curricula in Australia however has not stopped there. All Christian schools now include studies of other religions in their religious education curricula, and as schools revise their religious education curricula a more educational focus may be seen (see the chapter contributed by Buchanan to this section of the Handbook). While this owes much to a more sophisticated discourse about religious education among Christian schools

in Australia, it has also developed, in the opinion of this author, from the successful presence of the phenomenological approach in the state based courses in the senior school certificate.

Controversy About Phenomenology as a Method for Religious Education

During 2001 a debate was conducted in the journal *Religious Education* between Terence Lovat (2001), an Australian scholar and proponent of the phenomenological method in religious education, and Philip Barnes of the University of Ulster (2001, 2001a) who wrote in the context of the British education system, where the method of phenomenology in the study of religion was widespread. Barnes began his critique with a review of a 1988 debate in the House of Lords, where Christian groups had successfully lobbied for Christianity to be privileged in agreed syllabi, because Christian traditions were in the majority in the community. Barnes showed how the debate quickly became ideological, with an increasingly conservative Christian lobby attempting to assert Christian supremacy and marginalise adherents of other religions, while those who advocated phenomenology contented themselves with exposing the prejudices of their opponents, and appropriating the moral high ground of tolerance, openness, autonomy and social justice. After his careful description of the phenomenological approach to the study of religions that followed his review of the debate, Barnes attempted to raise what he considered were the critical issues that surrounded the use of phenomenology as a method in religious education.

He claimed that the assumptions that underlie phenomenology of religion—that is, that there is an essence of religion, that this essence is experienced in religious consciousness, and that there is a dichotomy between religious experience and the language used to describe it—can no longer be held. He challenged the basic premises of phenomenology, that the heart of religion is located in the experiential self, that the stories, rituals, language and symbols that express it in the world are distinct from this consciousness, and that religious consciousness extends far deeper than, and well beyond, these phenomena. Barnes (2001) summarised the phenomenological method in religious education in these words.

In studying religious founders or holy places, or sacred acts, one is being prepared for the moment of encounter with the Sacred. Education can only point. It can take one to the threshold of experience. It pauses at the door of the Holy—those who proceed further enter into the heart of religion and subsequently come to speak, however imperfectly, of the mystery encountered (Leech, 1989, cited in Barnes, 2001).
